

TRIUMPHANTGEORGE
COMPENDIUM

TriumphantGeorge Compendium - Part 1

* * *

Welcome to Dimensional Jumping (982)

Dimensional Jumping is a place to share your personal experiences of the shifting nature of reality, through the deliberate application of techniques to bring about "jumps" in our personal worlds - in effect, switching to a more desirable universe. Below is the original method that kicked off this sub. However, there are different ways to approach this, and one flavour might suit you better than another (particularly if you don't like the idea of a literal "other you"). You might also choose to ask: "What's it all about?"

IMPORTANT NOTE

There is no established theory of "jumping" or its mechanism, although there are numerous ways of viewing its nature. It is for readers to decide for themselves through personal investigation and introspection whether jumping is appropriate for them or not. An open mind combined with healthy caution is the correct mindset for all approaches targeted at the subjective experience. **Never believe something without personal evidence; never dismiss something without personal evidence.**

* * *

What's it all about?

"It"

One of the most difficult things to grasp when it comes to "jumping" and its associated metaphors, is the change in the concept of what "you" are. Although this isn't required in order to make changes, it's probably the most helpful thing to get a handle on for both "jumping" and for just everyday living.

The summary of your situation is this:

- What you truly are is an "open space of awareness" in which experiences arise.
- The experience you are having of being a person in a world is really a thought about "being a person in a world".
- It just so happens that this is a very bright, immersive, multi-sensory 3D thought - and we confuse parts of this thought with who we really are, incorrectly.

Experiencing It

There are various methods which can help us to recognise it. What they all have in common is that you stop trying to thinking about this situation (that just creates more experiences) and instead directly sense the space around you and within you. Meditation is one such method, however as mostly practiced it's a great "settling down" technique but relies upon chance for a glimpse of the background experience. Far better to pursue things directly. For this, we can pursue exploration of our direct experience, by attending to it and/or by choosing to alter it:

- The books of Rupert Spira (Presence Vol I & II), Greg Goode (Standing As Awareness) - see samples via links - and Douglas Harding (On Having No Head and Head-Off Stress) are particularly good with helping readers investigate our direct experience as it truly is. The Harding experiments are an easy way for a quick flavour of what is involved.
- Application of the jumping techniques described here can be applied for experimenting with making changes to our experience. Attempting to directly create synchronicity via patterning is a quick way to prove to oneself that your personal world is more malleable and basic than you might have assumed. (Relevant to this, Kirby Surprise's excellent interview discussing synchronicity is well worth your time.)

Understanding It

Reading about theories from science and philosophy relating to "private world" ideas can help provide us with more grounded metaphors:

- Marcus Arvan's P2P hypothesis envisages us as separate nodes each with a private copy of the world; Christopher Fuchs' QBism approach to quantum mechanics (more here) reinterprets the wavefunction as something akin to a personal "world-pattern".
- Richard Conn Henry's article on The Mental Universe and N. David Mermin's Bad Habits article on not confusing ideas with solid reality both give a nice overview of how direct observations should be treated as primary.
- Finally, George Berkeley's Three Dialogues is where it all began for idealism (the notion that everything is thought or ideas with no solid substrate behind it).

Reporting It

Another source of inspiration and knowledge can be unusual personal anecdotes - in the form of "glitch in the matrix" or "reality shift" stories, and reports of altered state or NDE experiences. An example of a description of being being open awareness, and a thought becoming immersive and becoming a dominant experience, is this account of meditation into pure awareness.

Excerpts:

"The best way that I can describe it is that this state was beyond the need for thoughts or senses. Thoughts and senses are things that in my view pertain to consciousness. Where I was, it was a state of pure awareness-beyond consciousness and therefore the need of thoughts or senses."
"It was ... like letting go of something that I was stuck to. It was as if I was a balloon that was tied down and then suddenly released to begin floating. Like I was carrying a heavy weight on my back that was finally lifted. This was the feeling right at the point of entry. What followed was the state that I could never fully describe in words."
"The experience was void and yet all encompassing at the same time. It was a state of demanifestation with the seeming power to remanifest should I choose to introduce thought. It was kind of like this; I wasn't thinking but if I did think, I would become what I was thinking. Therefore, I dared not think about anything because that would have meant that I would have manifested out of total awareness and bliss. Being in this state was beyond bliss, you want to stay there and not do anything to disturb it."
-- Victor C Other 6247, NDERF

Being It

This part is easy, because no matter what experience you appear to be having right now, you are still that open conscious space. You cannot not be this. You might take on the shape of this or that world, but like a pool of water that has become rippled, you are still that water. The added benefit you have over most puddles: **you are a pool with the power to ripple itself!**

KEY POSTS

The following posts detail the metaphors and mindset which underlies the "dimensional jumping" approach:

The Hall of Records

Reposting this to help clear up questions about what happens to "the other you". There is no such thing : what you are doing is selecting a different subjective experience, like shifting to a slightly different dream. This involves thinking of "you" in a slightly different way.

The Hall of Records

Imagine that you are a conscious being exploring a Hall of Records for this world. You are connecting to a vast memory bank containing all the possible events, from all the possible perspectives, that might have happened in a world like this. Like navigating through an experiential library. Each "experience" is a 3D sensory moment, from the perspective of being-a-person, in a particular situation. And there may be any number of customers perusing the records. So this is not solipsism: Time being meaningless in such a structure, we might say that "eventually" all records will be looked-through, and so there is always consciousness experiencing the other perspectives in a scene. At the same time, this allows for a complex world-sharing model where influence is permitted, because "influencing events" simply means navigating from one 3D sensory record to another, in alignment with one's intention. This process of navigation could be called remembering. Practically, this would involve summoning part of a record in consciousness and having it auto-complete by association. This would be called recall. You can observe something like this "patterned unfolding" occurring in your direct conscious experience right now. So in terms of "dimensional jumping" you don't need to worry about another "you". You are not even the person you are experiencing, you are simply looking at this particular series of event-memories, from this particular perspective. "Jumping" means to decide to recall a memory that is not directly connected to this one. If you are feeling adventurous you might also check out my post elsewhere on [The Patterning of Experience].

Note that none of this metaphorical stuff is necessarily required though - all that matters is that you are willing to let go of the current experience, and believe that you can connect to another experience which is discontinuous with it. However, these "Active Metaphors" better allow you to format yourself. I do like the idea that we might one day develop a Library Guide for Researchers which would help us all navigate this stuff more easily.

...

Q: Have you ever heard of NLP? It sounds very very similar to your idea of how dimensional jumping works.

I have indeed heard of NLP!

The early modelling stuff was good I thought (Frogs into Princes, The Structure of Magic Vol I) but after it became a marketing thing and John Grinder disowned it, it went downhill it seems, so not followed it much lately. Whereas NLP was playing around the edges of "how you conceive of things affects your response to them" - it never had an underlying philosophy of the world at large - the "jumping" thing is more a case of leveraging philosophical idealism. It's only a step away from "magick" I'd say, but also nearer to its essence. Have you experimented much with either?

Q: I've been actually getting into Magick and NLP lately and I came across this sub around the same time as well, and you're right they all strive for the same kind of idea: that you have a 'choice'. I feel like Dimensional jumping is a way of convincing your subconscious to allow you to manifest a powerful will upon the reality in front of you, in the same way as magick, it's just that they have different techniques of communicating with the subconscious, all have a powerful desired state but are all different 'methods' of reaching that ideal state or outcome. So I'm remaining humble and skeptical but at the same time, I notice a pattern in all of these. Whatever the thinker thinks, the prover will prove. So in a way, I've rationalized that we are always dimensional jumping, constantly shaping our will and our energy field, it's just that sometimes there are crazy synchronicities that happen. I'm curious to see how you would differentiate all of these.

I say: **there is no subconscious.** It's just the parts of the world you aren't looking at right now. **All intention affects a part of this world directly and the effects are seen from that point on.** The only difference between approaches (of any sort) for creating change is the world-metaphor (including the what-you-are metaphor). The world-model you've committed to limits what you will observe happening - so to make massive change, you need to alter that or put it temporarily offline, or a halfway version between the two.

EDIT: Adding headings for easier reading!

The World-Model

Could you expand a bit on what you mean by the world-model?

The "world-model" would be how you think things are "behind the scenes". For instance, perhaps you think that the world actually exists as a spatially-extended place that is "happening", even when you're not experiencing that? Or perhaps you think that space is itself a part of experience, it "arises with" it and is not "out there" beyond your current perception, in which case you'd recognise the world as having no depth. In general, whatever you adopt fully ("believe") then your experience will tend to behave "as if" it is the case. This of course make a massive difference to the changes you can make. If the world is actually super-flexible but you have assumed it to be far more rigid, you will be limited in results (except for occasional strange accidents) because you are simultaneously "casting spells" for a solid world and a flexible change.

Going Offline

By temporarily offline do you mean that you need to 'suspend disbelief'?

In a way, yes exactly - but it's good to be a bit more specific. What does it mean to "suspend disbelief"? It means to cease asserting that the world is a certain way. While you are "re-triggering" the world you can't make much change, since you are re-asserting it being how it is right now. That would be like trying to stand up while keeping the idea of sitting down firmly in mind! You have to let the current state "go fuzzy" so that you can "think into it" with a modified version. So I mean something like: temporarily detaching from the thought of "the world". Typically, people get themselves into altered states via trace, meditation, drugs, staring into mirrors, or simply withdraw from that main sensory thread. An alternative and more permanent alternative to forcing these states is to change your world-model, of course.

The World-Thought

To reiterate this point:

All intention affects a part of this world directly and the effects are seen from that point on.

If you adopt the flexible world-model that your experience has no "depth" and is basically a 3D multi-sensory thought, then it becomes clear that every thought you deliberately intend on top gets incorporated into that world-thought to some extent. Detaching from the world-thought, letting its intensity subside (become "daydreamy") and thinking new facts into it is essentially how "jumping" and all these things work.

Cutting and pasting an example from elsewhere:

Owl & Screen Metaphor

You draw a picture of an owl on your TV screen. It is always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now instead imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day. Mostly the owl isn't anywhere to be

seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

The Infinite Grid of All Possible Moments

The Infinite Grid of All Possible Moments

Thought I might as well post this here in case anyone finds it a useful metaphor. Below is the description that goes with this animation. The idea is that it can be used as a way of visualising how all time is simultaneous-parallel, and perhaps jumping between "moments" if you want to pursue an alternative to the candles-and-mirror approach.

Introduction

This animation is intended to illustrate the idea that all possible 1st-person perspective moments exist simultaneously - as part of a metaphorical "Infinite Grid". In this model, what "you" are is the conscious experiencer who "looks through" a particular grid position as a sort of "viewport", and your timeline corresponds to the trajectory you follow across the grid, from moment to moment. Memories are attached to you, the experiencer, rather than to the moments you experience (although information may also be available as part of a particular moment). We tend to follow sequences of closely-related moments, to form a coherent personal history - however there is no reason why our experience can't be discontinuous and jump across locations, times, and viewpoints, with a mere detaching and shifting of attention.

The Experience

At the beginning of the video, you are lying down in your apartment, relaxing; the traffic noise comes through the half-open window and there is light rain against the glass. Soon you let go of the sensations of that moment, the sound echoes and fades as the experience dissolves into the background space, and you become delocalised. As the image of your apartment fades you realise that you are not that person in the apartment, but instead you are a vast aware space in which all possible moments are simultaneously realised and available. Any and all perspectives are available to you. Randomly, you recall a holiday you had almost a decade ago, with a friend - or was it the friend's story of his holiday, and you never went? - and an intention forms to attach to that moment, accompanied by a sense of movement, a growing feeling of localisation.

Sounds and images rush forward, as you feel yourself entering a bodily experience once more...

-- The Infinite Grid of All Possible Moments (16:9) [<https://www.youtube.com/watch?v=EdA4yN77q1oJ>]

...

Synchronicity abounds - today I came across a review of the TV series Being Erica. In the show, the patient undergoes a therapy process which involves their awareness being directed to a previous (or parallel-previous) moment. They can then make changes by responding differently within the moment, the repercussions of which are reflected in the subsequent "present". Never seen it - it looks far too rom-com for my liking - but I liked the idea. Dimensional Jumping would be going directly to the "present" that followed from such a change, without the detour.

Q: All I can take from it is that so long as we don't become involved in what we're experiencing we can perceive anything from any view. So we're not really jumping dimensions, we're shifting perception.

Right. And we don't even mean any view right now, or even any view in the past you were involved in. The jump from being in bed to being in a night-time dream is just the same process. We're shifting perception, or I'd say: attention, because that retains the notion that you are everywhere-all-at-once anyway, it's just that you are focused on one particular aspect of the infinite pattern. The larger point is that if you want to make particular changes perhaps it's better to have a scheme of thinking that you can absorb in which to do it, which accommodates it, rather than simply let go and kinda intend-hope. Meanwhile - "everything being available" means both that everything exists and, conversely, that nothing exists but anything can pop into being as required. Doesn't matter which way we conceive of it (not possible to distinguish between the two).

Q: I see you said "infinite pattern",and how how anything can pop into being as [required](#).[So](#),you are saying we experience what we focus our attention to.Therefore we can experience any moment,at any instant of time by focusing our attention. And that everything is in our head,nothing out there?I don't really understand ...What is reality,or is it just in our head/mind?

There is no head/mind except as a sensory experience (or a thought-about it) in your awareness. They are real, but only in that sense. One way to say it is that: reality is awareness taking on the shape of experience. In other words, waking life is dreamlike. All possible moments are 'dissolved into' the background of experience - that is what the 'Infinite Grid' metaphor proposes. You don't walk around the world, you instead have the world move within your experience.

An earlier attempt to explain this using the life-as-game metaphor: here [POST: Why did the devs implement dreams?].

The extra bit is that with the 'facts of the world' being dissolved into awareness, it is the shifting of your attention from one aspect of it to another, unpacking one moment into sensory experience then another in a non-discontinuous way, that gives the impression that you are living a life as a person, in time and space. What dictates your trajectory? Your held intentions, expectations and beliefs. Dimensional 'jumping' operates by having you detaching from those - detaching from the 'facts of the world' - thereby allowing them to shift in a way they otherwise could not.

Q: So in relation to that... We are still living all the past moments and experiences, even though our direct consciousness is in the present time? There's a 13 year old me out there in first period English... hmmm.

Not quite. Better to say that all possible experiences are present now - like all frames of a movie, except all frames of all movies, jumbled up - and available for viewing if you chose. What you are, is the eyes which can view. So there is no "you" in English class (I liked English!) but there is a fully-immersive "moment" that you-as-consciousness could step into if desired. Right now, your attention is on the moment with this "viewing the fascinating outpourings of reddit" image in it.

Maybe I'll go check out your English class moment...

...

Part 1/2

Hey, provocative is fine too! Let me give a full answer with background, since I'm not sure what you've read and not, and it's also a good opportunity to bring together some thoughts.

Skippable Background

If you've been reading all our tangled comment discussions over at /r/Oneirosophy, you'll know what the underlying project is, which is basically philosophy => realisation => manifestation:

- To develop what I've been calling Active Metaphors which can be used to reshape our experience. There are no theories as such because there is no solid underlying to experience (although there are very ingrained habits). Any descriptions are valid only insofar as they lead to desirable experiences and make sense of experiences to date.
- To get to the essentials and thereby describe and account for: daily experience, "glitch in the matrix" experiences, and direct intentional change.
- To find better ways to lead people to the underlying realisation of the structure of experience and what they "really are", which is independent of the present sensory experience.

My involvement on this subreddit came about by accident really: I came across it and thought it maybe a bad idea to having people randomly encounter the sub and do

undirected detachment, without the awareness and framework that, say, people in /r/occult might have. Multidimensional magick, one of the original forms of this, was basically "submit to my true will on the wheel of fortune" and the instructions themselves compare it to suicide (of your world anyway). It's fun to mess around with concepts and philosophies and ideas - it absolutely is - but since results can be a serious thing, there needs to be an element of caution and a way of thinking about things, so that it's not treated too casually. So here I am.

Meanwhile, I am committed to the view that people shouldn't believe anything unless they've tried it - dismissing something is fine though - so the attitude here is to be "here are ways of thinking about things, try them out". But just doing it randomly isn't so good. Hence encouraging people to experiment with doing low-key stuff (e.g. intentionally creating synchronicity, which underlies everything really) as a way to see how it fits. It pretty easy to prove to yourself that there's "something going on" and it's then up to the person to pursue it or not. If you've read the 'reality-shift' accounts elsewhere you'll find that most people just find it very disturbing, even if it happens deliberately rather than accidentally, because of the implications. You find you're living in something which behaves a little like "declarative dream world", where (as Alan Chapman says much better than I in his excellent primer) everything means what you decide it means. So, anyway. In terms of reporting my own experiences, I do try to keep my personal stuff out of this and you'll find that anyone who explores this much - whether in a more traditional form or the direct intending that we're describing here - will be inclined to do the same. Most people discuss ideas rather than results. There are basic practical reasons too; people tend to adopt a "law of silence" in magick for reason (avoiding being stuck with certain patterns and bound to others). However...

Part 2/2

Jumping & Me: Effects and Side-Effects

Personally I don't do the "jumping" thing as described in the original post here. As linked in the sidebar, it's more about this...

- Overwriting, Deciding and Patterning for extended pattern triggering and autocompletion.

...which is for experimenting with different metaphors to make changes.

In a sense, there's no real "method" involved - you let go of this thought, you welcome a replacement thought - but a formal super-flexible description is helpful because it provides an intentional route. However, in the main the techniques are intended to create a baseline open state which is as "thin" as possible. When people talk about little strange effects like you describe, they are "collateral shifts" or side-effects from not really having a clear intention. Just like synchronicity experiment where you end up with the same concept overlaid everywhere. They're happening all the time anyway if you pay attention, inconsistencies and persistencies. With directed intention, though, you are being specific, having already set the ground. So typically we are talking about information acquisition, creating and undoing situations - generally, modifying or defining "facts" without breaking personal reality and making it temporarily no longer "make sense". Those are my experiences and results do happen. You're just doing what you've been accidentally doing anyway, but knowingly.

What people will probably tell you is that: If you've done the "releasing/overwriting" work, dealt with a few major bumps, life gets more relaxed and smooth anyway. Unless you are into experimenting in order to understand and play and explore, it then becomes about just maintaining a certain state. Because at some point you're wasting your life:

One day the Buddha met an ascetic who sat by the bank of a river. This ascetic had practised austerities for 25 years. The Buddha asked him what he had received for all his labour. The ascetic proudly replied that, now at last, he could cross the river by walking on the water. The Buddha pointed out that this gain was insignificant for all the years of labour, since he could cross the river using a ferry for one penny!

At some point you can de-pattern yourself to basically stop being very human; if you want to live in the world then you have to remember what you're living for. The balance is to realise the nature of your situation, get rid of unwanted debris, and then enjoy the rest, having a tinker about when you feel so inclined. Having said that...

Teleportation: Endgame For 3D-Imagery-Update

I've also seen a comment that you talk about teleportation/change of scene.

I think that came from "Next: Teleporting for beginners" which was a little joke, but also deliberate because teleportation is the extreme end of what we are doing - aiming to observe discontinuities in experience rather than subsequently discovering them - which is why I've used it in examples. Since making changes requires that you detach from the part of experience you want to change (whether by it being out of sight or just being withdrawn) then I see that experience as the ultimate experiment for personal fun. Time compression with Fotamecus doesn't count, for instance, because you don't experience it happening. I've not done it yet, alas! The method-process would be exactly the same as everything else. You are not really "in" the room you are experiencing; it's present imagery and you can directly experience this fairly easily.

So "work in progress" is the idea. But I'm just doing this for enjoyment; perhaps others are more serious about such things and would like to push it further, faster.

Have you done much experimentation yet?

TL;DR: My attitude is: here is the situation as I'm seeing it, if you like those ideas then try experimenting for yourself and see if it's your thing.

So you see where I'm coming from. As to the "basic method" that started this sub, I think that (like the Multidimensional Magick post) it just releases what you are holding back and lets it manifest. So potentially, if you're holding back some fury, then you let go of that, and your world shifts in that way... and then you lock back up again, fixing that state in place! That's why I'm all about encouraging people to have something in mind, and try a more specific approach to change. Candles and mirrors are traditional for all sorts of capers, I guess because they encourage a sort of detached state naturally, and because mirrors themselves are, I think, highly active metaphors. If you think about it, the only "you" you experience is the one in the mirror. It's only by a trick of thinking that you associate the image with what you are and how you look. The Douglas Harding experiments are a good way to explore this deliberately, if you haven't tried them already.

...

Great question. I'd say it's a matter of intention. Let me have a go.

First, let's establish a particular view: that what you "really are" is the consciousness in which experiences arise. So you might have the experience of being-A-in-the-world and you might have the experience of being-B-in-the-world. The switch you are talking about is a swap between one and the other. You-as-consciousness persists, but the content had changed personalities. If you simply intended that you have the experience of B but the world (A) is the same, then you've summoned the experience of being-B-in-the-world-of-A. You won't have a choice ("what should I do in that situation?") because you won't remember being A at all. You will and always will have been B. Some crazy folk might come up to you and say you are A, but you'll think that's nonsense.

But... that's not what you would do, because with that approach you've basically decided that "I will change by updating my personality and deleting my memory but the apparent world remains the same", and have put them out of step. The key here is about perspective. There is no 3rd-person view to this, no outside view, you are always choosing what subjective experience to have in the future. What you would actually do is change the whole experience, right? You would "update the world" such that you were and always had been B and had no recollection of A - you'd update for a consistent experience.

For all you know, you might have already done such a thing last week. One morning last week, you were C and working in a coal-mine in New Zealand. You decided to update the world such that you are invisiblemongoose, always have been, and are living wherever-you-live-now. And that become true and always true. But something, some itch, some previous trace is still there, and you feel driven to go on reddit and find out about how worlds can be changed overnight...

Or does the fact that only my perception have changed and not theirs means that I did something wrong?

Remember, you have to think in terms of 1st-person subjective experience. You wouldn't actually know this; you'd just think that there was a bunch of strange folk telling you that you're someone else.

EDIT: I remember reading a couple of posts over at /r/tulpas where people were asking about swapping, but I don't remember anything else coming from it.

without total faith in the metaphysical phenomena the person wouldn't even swapping at all

Yes, on the tulpa example: I think you're right that such a radical change is going to be all or nothing, whereas the original setup was almost "what if I did it but didn't really?"

If you choose to "switch to personality B and have no memory of A" then that's a different thing to "change the world such that I was always personality B".

That's why I think that can't be just a matter of different metaphors, like many discussions seems to point that is all the same thing, but there is obviously a key difference between...

It's a tricky topic so let's try and work through it.

When it comes to approaches (1) and (2), they are really the same approach, surely? Reality doesn't work two ways, it has one way. The metaphors are just ways to conceive of change. And if you can conceive of something, you can experience it - because the only difference between an experience and a thought is the brightness and stability of the sensory imagery. Fundamentally, anything can happen. There's no reason at all why this room can't just disappear right now and another room take its place. Why doesn't it do so? Habit or momentum, you might say, and the extent to which I am holding on to - continually activating - current patterns of experience. And implicit in any "decision" is the context and intention.

- If I decide to gradually become a better person, then that's a gradual letting go of patterns, a gradual wearing away, and a slow change in "time".
- If I decide to just instantly become another person, then that requires I completely let go of the current pattern, to allow it to shift more rapidly. This is a type of world-suicide - or more accurately, it's like going to sleep, entering a lucid dream, letting go of all hold over the initial world and never coming back.

The trick to thinking about this is to flip around our conception of the world. We are not bodies or people in a world, we are a "conscious space" in which being-a-person-in-a-world type experiences arise. And furthermore, that "conscious space" is infinitely malleable and can take on any shape at any time. Where metaphors come in is that they give you a context for change. If you adopt the metaphor of "the world is a solid spatially-extended place" then your experience will tend to correspond to that: slow change. If you adopt the metaphor of "the world is one of many worlds and we can 'translate' between them", similarly. It provides a path of manifestation. In both cases it's really the same deal: A dreamlike experience with no solid substrate behind it, which behaves "as if" the ideas you accept are actually true. But the only truth is that there is conscious-awareness having experiences.

EDIT: Ah, was replying to the other one so just copied it over here.

So, is it basically a matter of one's level of detachment from the current patterns of experience?

Nicely done on the Totoro link! Of course, sometimes trees just glitch themselves, apparently. Actually, I think /u/Roril had a tree-related story somewhere, but I can't remember what it was. And yes, that's basically it: we detach such that we aren't constantly re-triggering the current experience, and this allows a more dramatic, discontinuous change to occur in experience. We're basically loosening our hold on the world to let it shift.

The person still need to figure out how to reach such a level of detachment...

You can't figure it out. Figuring out is an experience.

...achieving a specific set of skills...

That's an experience too. Detaching isn't an experience or a skill. And so on. Rituals are a way to cheat into detachment: making you hard-focus until you get exhausted or pushing you into a state where sensory experience blanks. But the only way to be detached really is to cease controlling your attention so that it disappears and you are left as an "open space" with your experience floating in it. Detachment is to cease something, not do something. You don't get better at "doing" visualising as such, I found - you just gradually stop being in the way so much. If you start doing daily visualisation practice, you'll likely notice yourself trying to "paint" the image or make it appear. That won't help though. When you get good at it, what happens is you "want" the image and then it appears "by itself". (EDIT: You imagine-that the image is there as a fact, and let it appear by itself.) People call this "the subconscious" or whatever, but really what's happening is that the image, being a continuous part of the intention, is arising without resistance. Your intention to visualise has shifted things, but really it's switching into allowing that brings things up a level. Having said all that, people do find rituals and techniques helpful, because they find it easier to believe that something else is doing the work, something else has the power, rather than themselves. But since it's all in your imagination anyway (literally everything), it's just a story you're inventing. You might as well get used to being more detached generally, and just relaxing into a more relaxed state if required for "editing" type activities?

When Biblical stories talk of "faith" (knowing things will happen despite lack of evidence) and "giving up to God" (allowing body, mind and world to shift) and "dedicated prayer" (non-deviation from intention of desire) and "asking and receiving" (declaring what you want, letting it come into experience) and all that, it's this they mean: giving up apparent control in order to gain true understanding and influence. There's no world behind the picture of the room you are experiencing right now, etc. You could lie on the floor and decide to absolutely just give up control totally and forever, right now, and you'd probably have an interesting experience as a result. (Or: get a bit dusty depending on the state of the floor. Who knows?)

EDIT: This all makes it sound much more esoteric and complicated that it really is. Although the "world" might seem complex, the actual reality of it isn't. Just like no matter how many scribbles you do on a piece of paper, no matter how tangled the lines, it remains: a piece of paper with scribbles. No matter how many waves there are in fish tank, it's still just water.

Q: Talking about this? [https://shorturl.at/YPBuJ] That's a tree returned within 6 months of being chopped down. Also of importance is how I once saw Halley's Comet in the daytime in May 2000, but now it switched to 1986?!? [https://shorturl.at/836dt]

Aha, I summoned you using my special powers! ;-)

That's it, I was looking for it in /r/Glitch_in_the_Matrix. I missed your Halley's Comet one - just reading through the comments, that sounds pretty interesting (not something I experienced). Oh and there are indeed daytime-visible comets so ignore all that nonsense.

...Those sneaky Kahunas - nice trick! Our own technologies are, I think, driven by exactly the same process. The screen you are using does not "work" as you might imagine. Or rather, it works exactly how you imagine-that it should - it's just that there is nothing "behind" that imagining. The classic "beginner's luck" is a thing, I think, and children in their ignorance do occasionally seem to have quite extraordinary experiences - later dismissed as false memories. There's nothing wrong with capitalising on it. Maybe get the children to do everything for us? :-)

Well, experimentation is the way to go. There's nothing to it really: be okay with things as they are, and then imagine-that things are how they should be.

...

Q: Lol why is everything deleted here?!

Looks like someone cleared out their account. (Really annoying that, cause it completely destroys a conversation by deleting half of it.)

Q: The way most of the responses I've read by you in this thread are written I can get a sense of the posts that were missing.

Yeah, you can see that someone has cleared out their account... so all the things I was responded to have vanished. We will never know what the "great question" that kicked it all off was...

The Infinite Grid of All Possible Moments (/r/timetravel/ edition)

Cross-posting with modifications - the original concept was to provide a way of thinking about the nature of conscious experience and different experiences in a shared world, but I think it works as a way of viewing time travel also.

The Infinite Grid of All Possible Moments

The idea of this animation is that it can be used as a way of visualising how all time is simultaneous-parallel, and perhaps a way of thinking about "jumping between moments". In this scheme, there are no timelines except the history of your own experience, your own trajectory across the possible moments. Although we tend to assume that our intentions and decisions actually, say, directly move our arms or create certain thoughts, what's really happening is that we are implicitly choosing to shift to a moment which contains the corresponding experience. You don't ever "do" anything; you just "select experiences".

Since there is no actual past or future except your own personal sequence of moments, and there are no physical movements because being-a-body is just part of the overall sensory experience of a "moment" - there are no paradoxes and no limits on free will. Time travel, in other words, becomes a discontinuous jump in your experience, rather than an actual physical or even mental journey. You are basically "folding away" this moment of 'My Apartment 2015' and "unfolding out" a moment containing the experience of, say, 'Barcelona 2004'.

The summary that goes with the video:

Introduction

This animation is intended to illustrate the idea that all possible 1st-person perspective moments exist simultaneously - as part of a metaphorical "Infinite Grid". In this model, what "you" are is the conscious experiencer who "looks through" a particular grid position as a sort of "viewport", and your timeline corresponds to the trajectory you follow across the grid, from moment to moment. Memories are attached to you, the experiencer, rather than to the moments you experience (although information may also be available as part of a particular moment). We tend to follow sequences of closely-related moments, to form a coherent personal history - however there is no reason why our experience can't be discontinuous and jump across locations, times, and viewpoints, with a mere detaching and shifting of attention.

The Experience

At the beginning of the video, you are lying down in your apartment, relaxing; the traffic noise comes through the half-open window and there is light rain against the glass. Soon you let go of the sensations of that moment, the sound echoes and fades as the experience dissolves into the background space, and you become delocalised. As the image of your apartment fades you realise that you are not that person in the apartment, but instead you are a vast aware space in which all possible moments are simultaneously realised and available. Any and all perspectives are available to you. Randomly, you recall a holiday you had almost a decade ago, with a friend - or was it the friend's story of his holiday, and you never went? - and an intention forms to attach to that moment, accompanied by a sense of movement, a growing feeling of localisation. Sounds and images rush forward, as you feel yourself entering a bodily experience once more...

-- The Infinite Grid of All Possible Moments (16:9)

...

Q: This is great. In this model, maybe enlightenment would lead to awareness of the total matrix, and possibly even the ability to jump between locations. And that would imply that each individual is actually the same consciousness focusing on different portions of the matrix. Which would mean that there are no individuals, and all are really one.

Yes, this is exactly what the model is shooting for!

Everything is 'dissolved' into the background awareness, all moments and all perspectives, with no fundamental separation - and yet, apparent separation, and individuals, and timelines. It also allows everyone to experience anything, even if there is a requirement that other people experience them doing something else. We get confused and think that we are a particular body in a particular story, because we've got our faces "pushed up against the glass" of a particular set of moments. If we take a step back, though, we discover our situation is not as we had assumed, and nor are we...

The Imagination Room

Things tend to come up in comments and discussions which then get lost in the fog of history, so I'm posting a few potentially useful fragments as posts to make them easier to find.

The Imagination Room

There is a vast room. The floor is transparent, and through it an infinitely bright light shines, completely filling the room with unchanging, unbounded white light. Suddenly, patterns start to appear on the floor. These patterns filter the light. The patterns accumulate, layer upon layer intertwined, until instead of homogenous light filling the room, the light seems to be holographically redirected by the patterns into the shape of experiences, arranged in space, unfolding over time. Experiences which consist of sensations, perceptions and thoughts. At the centre of the room there are bodily sensations, which you recognise as... you, your body. You decide to centre yourself in the upper part of that region, as if you were "looking out from" there, "being" that bodily experience. At the moment you are simply experiencing, not doing anything. However you notice that every experience that arises slightly deepens the pattern corresponding to it, making it more stable, and more likely to appear again as the light is funnelled into that shape. Now, you notice something else. If you create a thought, then the image will appear floating in the room - as an experience. Again, the corresponding pattern is deepened. Only this time, you are creating the experience and in effect creating a new habit in your world!

Even saying a word or a phrase triggers the corresponding associations, so it is not just the simple thought that leaves a deeper pattern, but the whole context of that thought, its history and relationships. Now, as you walk around today, you will feel the ground beneath your feet - but you will know that under what appears to be the ground is actually the floor of the room, through which the light is shining, being shaped into the experience around you. And every thought or experience you have is shifting the pattern...

A Personal Addressable Voxel-Space

Another way to envisage this is as a voxel space.

A set of voxels in a stack, with a single voxel shaded

Imagine a complete and total void with not even space. Now, imagine a 3-dimensional array of cubes going on forever.

Each cube can contain a sensory "pixel" (visual, auditory, texture, taste, feeling). The room you are in now is basically a particular sensory pattern existing in that array. If you think a thought, that appears in the same voxel-space, only less intense and less stable. However, it leaves a trace upon the space, a slight deformation, however subtle - which results in a momentum from the current state towards the state described or defined by the thought. If you are completely detached (is in, not "persisting" other patterns) then the transition between states is effortless and clean. Otherwise, what occurs is a mangling between the present state and the thought, and any other thoughts you are holding onto or resisting. So when you "look back" you are literally re-defining the target of the voxel-space to your previous state again. That's why lots of "manifestation" type techniques recommend "letting go of your desire". Not because you need to forget what you are after, but because our tendency is to re-created the "state of desiring" when we think about it.

Imagining That

When we talk of imagination and imagining something, we tend to think about a maintained ongoing visual or sensory experience. We are imagining a red car, we are imagining a tree in the forest. However, imagination is not so direct as that, and to conceive of it incorrectly is to present a barrier to success - and to the understanding that imagining and imagination is all that there is. We don't actually imagine in the sense of maintaining a visual, rather we "imagine that". We imagine that there is a red car and we are looking at it; we imagine that there is a tree in the forest and we can see it. In other words, we imagine or "assert" that something is true - and the corresponding sensory experience follows. We in effect recall the details into existence. It is in this sense that we imagine being a person in a world. You are currently imagining that you are a human, on a chair, in a room, on a planet, reading some text. We imagine facts and the corresponding experience follows, even if the fact itself is not directly perceived. Having imagined that there is a moon, the tides still seem to affect the shore even if it is a cloudy sky. And having imagined a fact thoroughly, having imagined that it is an eternal fact, your ongoing sensory experience will remain consistent with it forever. Until you decide that it isn't eternal after all.

Exercise: When attempting to visualise something, instead of trying to make the colours and textures vivid, try instead to fully accept the fact of its existence, and let the sensory experience follow spontaneously.

...

So, idea-fact-thing-pattern intensified and accepted! There's no how or why needed at all; that's just additional narrative dressing. It's never necessary to "work things out" or even justify things in any way. Those are just routes towards, finally, allowing something to be the case. Realising and integrating the "fact" that nothing is concrete (even the experience of "concrete") is probably a good first step, actually.

...So, your dimension=what you are is the environment in which all appears. All other characters are just as real as you-as-person, in the sense that you are "real", because you-as-person is just part of the environment too. It just so happens that you have taken on that particular perspective. If you need a model for the sharing, I'd suggest that rather than a shared "environment", the so-called world is a "shared resource of information" and each of us has access to it, like a box of patterns we can use to build and change things. You can do what you want with your copy of the world, and just think that the overlap with the appropriate aspects of other perspectives will take care of itself.

Philosopher Marcus Arvan actually promotes a P2P hypothesis which is like a non-centralised game. However, if the apparent overlap is itself defined by your copy of the world, then basically it's "as if" you dictate the shape and contributions of other nodes too. Other relevant links in this post ("What's it all about?").

All Thoughts Are Facts

All Thoughts Are Facts

On using the world-as-thought perspective as a way to create deliberate synchronicity and therefore particular scenes:

- You are an "open conscious space" in which thoughts arise. The apparent world is basically a very bright, stable, full 3D-sensory immersive strand of thought.
- The world evolves by the accumulation of observations or "facts".
- Every thought you have about the world is literally adding a new fact to the world.
- Thoughts which randomly arise simply reveal the current state of the world.
- If you deliberately think a thought, then you are deliberately adding a new fact to the world. (This is how to make changes.)
- The more intense the thought, the stronger the influence of that “fact” upon your experience.
- If you respond emotionally to a random thought, then you are in effect re-thinking it as a more intense thought, meaning it will contribute more. (Hence fearful thoughts tend to increase the prevalence of fear-related experiences; however this works just as well for nice-emotion thoughts.)
- If you “grasp” onto a thought then you are persisting it - you are maintaining it at its present level of intensity and not letting it fade and be “forgotten”.

Things such as detachment, surrender, abandoning yourself, and so on, are all about letting the current dominant thoughts or “facts” become softer and fade, letting the world shift freely, and allowing other thoughts to shift into prominence.

...

Q: Reminds me of a line from Star Trek - "Nothing unreal exists" - Spock
[<https://shorturl.at/F0ZcV>]
i. e. it is not event possible to imagine a thing, event or world that is not a part of existence, however, it may be a part of a reality frame that is not accessible from this one.

He's a logical guy, that Mr Spock! And after all, possibilities are concepts in "logical space". If you can conceive of something, you can experience it in some form - because of course even just the conceiving of it is the experiencing of it in some form.

Q: So, can we change facts for other people or just fr ourselves? Is everyone living in different realities that can still interact with eachother? Or can everyone change facts for everyone else if they want to? I'm fairly new to this sub, and very intrigued.

If you adopt a new perspective on your apparent reality, you find that in effect you have a private copy of the world. Your experience is basically an ongoing immersive thought about being in that world. So you can change that apparent world however you like, and that includes your experience of other people's situations. Your question is then inevitably: in what sense am I sharing the world with other people? And the answer is something like: it's more like sharing a "resource" than an "environment", like everyone has access to the same library of possible experiences.

Q: Thank you, hopefully I'll continue to get a better understanding reading posts here. It does get slightly confusing at times, ha.

Ha, no problem. It's actually super-simple it's just very hard to put into words!

If I were you I'd simply choose to completely accept one of the two metaphors listed in the sidebar and take it from there. (They are designed to give you an easy way to adopt this without having to worry about the details.)

Then, every day spend ten minutes lying down on the floor and "playing dead", giving up control, surrendering completely to gravity, releasing your mind and body and especially attentional focus, letting them move however they want - to get used to what detaching is like. (It feels nice to do this anyway. Nothing to achieve, no aim other than allowing things to shift about as they please. The most relaxing thing you can ever do.)

Thanks! I'll try that.

A Line Of Thought

A Line Of Thought

All possibilities, anything you can conceive of in thought, exists logical space. What dictates whether an idea becomes a dominant aspect of your world is its intensity:

- We recall things into existence.

A line of thought...

- The world is just a line of thought, albeit a bright and stable and immersive one.
- The world has no depth.
- Dissolved into the background space are all possible forms and relationships. It’s like a toy box filled with pre-made shapes and layouts, objects and containers.
- To bring them into worldly existence, we merely have to recall them.
- To recall them is to superimpose those patterns upon current experience. They are incorporated and “manifest” wherever context permits.
- The more specific we are with our recall, the more narrowly defined the context. (For instance, we might incorporate a timeframe or location or circumstance, and manifestation would be constrained appropriately.)

Manifestation vs synchronicity...

- An ‘intention’ is simply the name for a pattern which we want to see incorporated into our life.
- It can be non-sensory, since it can be the overall felt-sense of the pattern, without it necessarily being expanded into the sensory.

- What separates an intention from recall is the introduction of a specific spatial and temporal context plus, typically, a subjective viewpoint.
- This marks the difference between experiencing manifestation (including body movements, thoughts, “results”) and synchronicity (the appearance of the same patten across unrelated situations).
- If you can recall (conceive of) something, you can experience it.

...

Q: Hi, I’ve been lurking here for a while and had a question, so figured I’d create an account. I’ve been reading many of these threads in the past few weeks and absorbing a lot of the theory and technique behind ‘jumping’. From what I gather, a large part of it is dependent on provoking intense feeling and imagery inside oneself and, in turn, having those feelings & images manifest in your reality in one way or another. My question is with regard to the attachment aspect – attachment to the desired outcome, that is. Attachment seems to be the foil for this whole experience and will only hold one back. However, in the explanation above, it says the following: “The more specific we are with our recall, the more narrowly defined the context. (For instance, we might incorporate a timeframe or location or circumstance, and manifestation would be constrained appropriately.)” Isn’t this just creating more expectation and attachment to a specific set of circumstances that your outcome will be realized through? Thank you

For clarity, let's maybe split things into two:

- There is "triggering the pattern you want to experience". (We bring aspects of it into imagination, intensifying the contribution of that pattern to our subsequent experiences, where the context arises.)
- There is avoiding interfering with your unfolding experience afterwards. (Basically, not resisting it or re-intending it.)

Expectation itself isn't a problem if it's just anticipation of what you have created (I suggest). That's really just feeling the pattern again. The problem comes if when you are doing this, you are actually intending a different state, or if you are resisting the (sometimes rapid) shifts towards the new state. Non-attachment means being "okay with whatever is happening", trusting that everything has already been done at the moment of intention, and things are going in the right direction. If you are attached to the outcome, then there is a risk that you bring it into mind along with "oh I wonder whether this will happen!" or some other pattern which implies it is not certain.

Short version - When we are creating the change, it's about imagining from the end-state as if it was happening, then and now. When people get attached and concerned, they tend to imagine about the end-state and whether it can happen or not. This can mess things up,.

Q: I've been longing to search for this information!!! I've always been stuck between different concepts of how to go about manifestations specifcally between "Repeat intention everyday daily and keeping it on your mind for it to become into fruition with thought power" and/or "Setting so-and-so intention and letting go completely allowing the universe to send it into your outer experence." Now finally you have solved this concept confusion for me when you say: "non-attachment means being okay with whatever is happening". Also quick question, since we tend to focus on the end result as already in existence, should we still repeat daily on the intended statements we have set for that creation to come into physical experence or just literally forget about it and focus on the end result as truth as our day to day lives go on

I would treat every intention as literally updating the world, as intensifying the contribution of a particular fact, at that moment. So you should pretty much do it, and then just carry on with life. If you like, you can do a regular session each day (e.g. using imagination to create the scene that corresponds to your desire being fulfilled, as a sort of regular "intensification" or deepening of the fact), but then leave it alone other than that. And if you do that, you have to be careful of how you do it...

Again, think of it as being a direct interaction with the world. The problem with people constantly fiddling about, is that when they intend again, they often do it by re-intending the initial state first, then intending the desired state. Reset! So only intend the target state. Usual example which you can practice yourself: When people stand up from a chair, they often do it by first re-asserting that they are sat down, and then they intend standing up, by overcoming the sitting-down they just intended. This corresponds to re-intending the initial state, before intending the target state. Try this out. Now try standing without doing the re-asserting of sitting. Just imagine-that you are already stood up - and let the body move as it wants, being okay with whatever happens. You should find this a much more relaxed, effortless approach.

Q: The way you look at/think about these things are just so mind opening.. I never though of it in that way and it just encourages me even more to reread my intended statements and/or updating them as time progresses! Now with the targeted state, do you mean being able to imagine standing up while still sitting on the chair BUT you feel as if your body is really stood up in the imagination reality realm? Also im just complying with the example given. Now when it comes to my intention its basically recieving a big check, so i imagine myself seeing this white looking cardboard with details branded of whos giving me the check with my name on it & the specfic amount i am being given. I can see it pretty well as i improve the vision everyday now. Also what are your thoughts when it comes to time based manifestations? For example: manifesting so and so by Nov. 1st Its been bugging me of how curious i am too finding out how time based manifestations come in affect. Also i use to struggle with my financial life but with this check manifestation everything will be going extremely well! It already feels like i am relaxed and happy because of it.

So, with the chair example, you are sat down. You "feel-imagine" what it would be like to be stood up. You do not resist any movement. Your body will move effortlessly and "by itself". The key is in: a) not re-asserting being-sat-down first and, b) not resisting what arises. And those principles apply to all intention! With the chair example, you can actually do it as an exercise to get used to what "allowing" feels like.

On time-based, it's no different. You just need to create an immersive scene which implies that the result occurred in good time, with all the feelings and sensations that would go with that. All you're doing there is providing additional context to your intention - rather than just "I will see owls" it becomes "I will see owls within these additional circumstances; with this scenery". It's all about experimenting to see what works for you; just keep playing with it. As for the chair exercise, there are other similar examples in this chapter. They are intended for actor training, but they are great for getting in touch with your imagined environment. And they are fun too.

Q: For many decades of my life, I was a (purely non-professional) actor. Memories of some of this kind of training may be still rolling around in my sub-conscious! :) I just tried this "standing" exercise and love it! I loved it so much I tried "being at the top of the stairs" without intending still being at the bottom. Then I tried "being in front of the boiling water" without intending still being in the kitchen doorway. Of course, I still walked up the steps and I still walked across the kitchen to the stove! The difference was all in how it FELT, and that feeling was very different, indeed. Damn! I've been re-intending my starting point quite a bit. You've introduced a very valuable exercise. Thank you, Triumphant. <3 (Edited for spelling.)

It feels good eh?

In general: Stop trying got manipulate yours sensations, because they are transparent. For example, you can't move your arm by "gripping onto" the sensation of an arm, because that's just a sensation floating in your perceptual space. Sensations should be seen as results; the actual source of them (the thing that you are, and that you "do") is pre-sensation.

Q: Thank you, George. I always appreciate every bit of your advice. Must go back and re-read the "lying on the floor" business. Apropos of nothing, I just made what I suppose is an obnoxious comment on GITM. :p ...It's evening here; maybe I'm tired. I'm just utterly sick of the comments on Glitch, and don't think I'll go back there. It isn't worth the irritation the commenters cause me! Much prefer this sub.

Hey, click the report button over there if commenters are being dicks. Unfortunately they get occasional waves of new readers who don't get that, although disagreement is fine, it's about discussion not "winning". They get put on pre-approval.

Q: You have no idea what it means to me to help me on inproving my knowledge of loa. I am beginning to apply this new way of thinking and concepts to improve my overall life and i am goong to continue "jumping" my way further. Thank you so much for your help!

Glad to hear you're finding it useful!

Q: Yeah i remember when i managed to manifest my girlfriend having her period every time because i had unprotected sex but was always confident in my ability. I actual never realized i was using loa to create those manifestations. I know this might be an invalid question to ask because it depends on how it feels but i'll ask anyway: may i imagine myself recieving the check at so and so place (or does the background not matter so much) & constantly just visualize myself obtaining that check and every now & then and imaging other sceneos of where i am going, using the money at so and so places such as shopping at the mall with family seeing their happy faces and all of us holding shopping bags? Would that repeated imagery be well enough to create the manifestation of me recieving that check? In a sense I know i already have it as i put in faith in my ability to create and i constantly feel happy & relaxed all day along with my meditations to aid me.

Yeah, that sounds fine. As you point out, it matters somewhat what you are interpreting and intending the images to mean. That's the bit we can't really put into words very well - the intention. Basically, that doing this means-that it will happen. As I remember, there's a similarly structured story in Neville Goddard's Awakened Imagination, so maybe check that out for inspiration (the letter one).

Sync-TV: The Owls Of Eternity™

What's On TV?

One way of thinking of your current experience is that you are a conscious being who has tuned into one of a billion different TV channels. Each TV show has been filmed from a 1st-person perspective viewpoint. You are a viewer who has forgotten that he isn't actually the character onscreen. Doing a "jump" means to select a custom channel which fits your desires. The selection mechanism operates by using your thoughts. You imagine part of the content of the destination channel; the mechanism then autocompletes the selection!

The problem, though, is that without realising it we have our thoughts firmly fixed to the control panel at its current settings. So before a change can happen, we need to loosen that and detach from the scenes we're watching now. Only then can the channel mechanism perform the autocomplete. This makes it clear that there is no other "you" who gets left behind when you "jump", and nor does anyone get displaced:

- When you change the channel on a TV, do you leave behind another "you" still watching the previous channel? Obviously not.
- When you change the channel on a TV, does the previous channel still "exist" even if nobody is watching it? Does it matter? Surely not.

Synchronicity TV

We can modify the TV metaphor and make it more subtle, to help us imagine how selection and synchronicity works. Instead of switching to another channel, we are going to modify our current channel to make the content more pleasant. By doing this, we're in effect creating or shifting it into a customised channel.

In this example, we really want to experience more owls in our life, apparently without regard to the constraints of time and space and causality. For this, you draw a picture of an owl on your TV screen. From that point, the owl picture always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now we adapt this to daily life. Imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day.

Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

The Owls Of Eternity™

Note that the manifestations occur from the point of thought onwards - and that the owl pattern is overlaid on all subsequent experience regardless of prior observations. Hence, owl-related events might arise which, in the standard view, must seemingly have their origins in external events prior to your act. You may also notice, say, lots of owl-related items in your house which surely must always have been there. You may even find yourself noticing owl-related aspects when you recall events from your (apparent) past.

In fact, you may well start feeling uncertain as to whether these things always have-existed or whether they only now have-existed as a result of your act. These owls are spatially agnostic and have no respect for temporal matters! (8>)=

Note: These examples are linked to the ideas described in A Line Of Thought and The Patterning of Experience.

...

Q: I work for a medical company and 3 years back worked a flu clinic. We went to an old folks community and one patient, probably about 80 years old came up with an owl hat (like an owl sitting on top of his head), 3 watches on his arm with an owl design on each one. He also had an owl shirt and a cane with a plush owl sticking to the side of it. I told him nice hat.

His response: "I don't give a hoot!"

I don't know if I've ever laughed that hard in my life. I know, I know, not super relevant, but had I done this exercise the night before and then had this happen to me.....my goodness, I would be quite surprised!

Oh dear!

Q: This sounds kinda like just confirmation bias to me?

As in "seeing more red cars because I've just bought a red car", for sure. If you experiment though, you find it's something more than that. I'd scale it like this:

- conf. bias => coincidence => synchronicity => "manifestation" => shifting => "jumping"

They're all just varying levels of "pattern selection" or activation or overlay, of course. The exact same attentional mechanism that's always happening when we redirect ourselves, just to a greater extent. The thing to consider is, what are you selecting the pattern from?

You might be tempted to say that we select the pattern from the 3D-immersive environment around us, but actually that apparent 3D-immersive environment is the result of pattern selection.

Q: Isn't this kinda like the Baader-Meinhof Phenomenon? I've just seen a few posts about it recently...

Haha, very funny! As mentioned elsewhere, if you actually do the exercise, the progression of plausible explanation scales something like this:

- conf. bias => coincidence => synchronicity => "manifestation" => shifting => "jumping"

Strictly speaking, you of course can't tell the difference between noticing more of something and there being more of something, but when events arise that's a little different. And there's plenty of scope for changing the target and being more restrictive, to further prove to yourself there's more to it than that. If B-M could be described as "pattern selection from a 3D scene", then this effect is like experiencing "pattern selection from a 4D environment". As I say, you have to actually do it. Just thinking about it, you don't learn anything other than, well, what you think will happen. It's quite good fun, the more you play with it, the more interesting the results can get.

Q: Interesting... Thanks for clarifying! I'm pretty new to all of this but it truly is fascinating.

No problem. I suggest having a go with the owls, try the Two Glasses Exercise, and see whether there's something in it that interests you. They're both low-effort and they don't require any belief. (In fact, the whole point is that nobody should believe anything; you try stuff out, draw your own conclusions.)

Q: Tried this, but I really am only seeing owls where I might normally expect them (apps, toys, Halloween stuff). Gonna try it for \$20 bills though...

Yeah, I'm not sure Halloween is the best time. \$20 bills sounds like a good financial strategy. Although I suppose, there's no guarantee that they are going to be your \$20 bills...

Q: Interesting, but doesn't this lead to solipsism?

Not solipsism, because "you" aren't actually a person, what you are is a conscious perspective that is "before" the experience of separation. There's not "only you" because you are in effect taking on the shape of all people; it's just that your sensory experience is from a particular vantage point. In effect we experience a private copy of the world, and so does "everyone else". The nature of the overlap between us isn't like the sharing of an "environment", it's more like the sharing of a "resource", a toy box of possible patterns and experiences. This is difficult to describe in words, because in this view space and time are parts of experiencing - so we can't actually talk about different perspectives being located relative to each other or occurring at the same or different times, but language presupposes such "parts" and "locations".

The Hall of Records metaphor is one way to approach it. Basically, all conscious perspectives will turn out to be the same perspective in the end.

Q: If everyone is watching his own private TV channel, then the other people in your life are fictional.

So are you, though, in terms of "being a person". Going beyond the metaphor: you're not fictional, you just aren't what you thought you were.

Q: I don't like the "everything is fiction and I am actually God playing with puppet theater" approach. That's just solipsism.

Yeah, it's not really, although that metaphor obvious implies a separation, as if there's a "you" and a "theatre".

A better descriiption is to say it's more like everyone is an "imagination space" in which their experiences appear. Everyone exists 'parallel-simultaneously' in a sense, although the relationship between people can't really be described. This is because the perception of space and time is part of an experience, rather than a context in which experiences arise; you can't really talk about how different perspectives co-exist. The Infinite Grid and Hall of Records metaphors give one way to think of this. But...

If you stop thinking of the world as a "spatially-extended place unfolding in time" and instead think of it more as a "resource" which contains all possible experiential pattens, that's closer to the mark I'd say. Right now, you are a "consciousness' which is "taking on the shape of" experiences - specifically the experience of being-a-person-in-a-world. And everyone else is too. It's just that you are not in the same place and time; rather, you are all sharing the same "toy box" of experiences. And when we say "everyone" there, really we can't talk about it being lots of people that are living in a world; it's more like lots of parallel-simulataneous experiences that are happening.

...

How is this different from "we are the universe experiencing itself subjectively"?

It's not different at all, although we have to be careful what we are calling "we", because apparently being "you" is part of the experience. I wrote the phrase being-a-person-in-a-world in the earlier comment, but the next step is to rephrase this as "taking on the shape of":

being-a-world-from-the-perspective-of-a-person

Where "world" is in the larger sense of the concept, as something like the currently active patterns or "facts". This leaves the universe as being something like "all possible states".

All these parallel experiences are your experiences, you are living through every one of them.

For sure, but not "yours" in the sense of being a person. Rather, it is in the sense of being "that which has or takes on the shape of experiences".

Still, this worldview is unsatisfactory to me.

What aspects do you find unsatisfying or problematic?

For one, it rejects anything that can be observed because it's all in the imagination space anyway.

Well, I'd say that aspects of anything, as patterns, can be brought into sensory form, and that's what you are experiencing right now. Is this so different to seeing the world as made from atoms "out there" and you being trapped in a skull "in here"? This way, you have no boundary and the whole universe is "dissolved" inside you. Even in the standard model of perception, you are not observing anything directly. If you go with the idea that there are nerve impulses being sent to your brain and within that a multi-sensory image of the world is created - you still end up with a similar result in a way. The result is that, right now, looking around this room, all of it is just mental imagery floating in your "perceptual space" - i.e. your mind. The only difference is that we are recognising that, since we never experience anything beyond this "perceptual space", and that even our thoughts about an "external world" arise inside that same space, really there is no such thing as an outside, stable place.

Sure, we can pretend that there is one, based on how our experiences seem to have some habitual regularity to them, but the actual existence of a stable "substrate" that supports them, is fiction and faith.

There are no really rigid basic rules that can never be broken, because it's imagination space anyway.

Again, this is not so different to the standard view in a way. The "laws of physics", for instance, are not laws in the sense of being fundamental to the universe and being obeyed by all things. Scientifically speaking, a "law" is a general rule inferred by observation. We have observed certain "regularities" or habits in our experiences of the world and, combined with the concept of an objective external 3D place, we imagine that there is a stable place which unfolds consistently with those regularities. But we are just imagining it to be the case.

In fact, the "laws of physics" have changed many time over the last 100 years, never mind the last 1,000. The "physical universe" of today is drastically different to the "physical universe" of 100 years ago...

So we're left in much the same position in the standard model, as with the "imagination room" model:

- We only ever experience our own minds. Any "external world" is completely imaginary and without direct evidence.
- We observe regularities in our experience. Any "laws" are completely imaginary and without direct evidence.

The benefit of actually recognising this, though, is that the direct experience of being open and unbounded and "the space in which everything arises", is actually very nice. As an idea it sounds cold and empty and lonely; as a reality it is the opposite.

*Q: "As an idea it sounds cold and empty and lonely; as a reality it is the opposite."
This is exactly as I'm finding it to be - a somewhat disturbing or even frightening idea, at first, but before long you see it is your saviour, your Best Friend, your Self. The key is to work with it - work with it as if you were 5 years old again. :)*

That's a nice image, actually. There's definitely a "return to childhood" aspect to it.

Q: I just want to pipe in this old thread and say I was skeptical as fuck when I decided to try this. Within a single day owls started popping up. Watching futurama? Background billboards have owls. Checking the news? Blathers (an owl) amiibo was announced. And plenty of other instances of owls, despite me almost never encountering them before. Neat. I'll have to try this again, along with the other exercises.

It's good, eh? It's a nice exercise because it doesn't require any specific intention or belief - it's pretty much dumb-mechanical - but it gets you thinking about how it is possible, and helps flatten your concept of "experiencing the world" into something more like an "imagination room".

Next up: Two Glasses Exercise

Q: Hi, I'm very interested in this concept but quick question, are we actually supposed to do anything related to an owl or just be on the lookout for them?

You don't need to do anything, don't even be on the lookout for them. They know how to take care of themselves.

Just do this:

Right now, take five minutes and spend it imagining that there is an owl in front of you in this room - but before you begin, decide-that imagining this owl means-that "my life will be filled with owls from this moment onwards". Then carry on with your life.

Q: You put a trademark on this?! This is nothing more than telling somebody to have a positive outlook on something and it will happen, but with a TV metaphor.

Um, the trademark is of course comedic™. Although the exercise does not happen in the way you are suggesting.

Q: So retuning the channel, or editing the content is like shifting into 'a parallel world'. Wow! Like switching onto pre-existing train-tracks, roads, or paths, that don't really 'exist' unless we use them (incarnate into them)...I mean, a road isn't really a road unless cars drive down it right? ... This idea of the past rearranging itself is fascinating to me. I think the past does rearrange itself.... I get synchronicities all the time. A lot of the synchronicities I notice though pretty much every day, are my spoken words matching up with an emphasized word on TV, or said in a public space for example (along those lines of circumstance) and I point it out to people. This might be something different though... I assume that our 3D reality is manifested following some 'etheric' programming that takes place at a level of reality above ours. And at that 'above level', things are nonlinear, so what might seem straightforward and connected in a very logical way at a higher density, or nonphysical level of reality, might manifest in our world in a very 'coincidental' way - synchronistic. I like these ideas of programming our reality with thought, manifestation, and intent. It is empowering. Reality is very subjective, we all write our own lives.

So, it's like changing state - having a different set of patterns become more prominent. There are lots of different metaphors that can be used, but things like "TV channels" give you the feeling that there are states or patterns which are latent, they are just not currently "happening" until you trigger them into experience.

Synchronicities are an interesting side of it, definitely. It's very much a potential example of the "patterning" of experience - i.e. that both sensory experience and thoughts arise in the same perceptual space, and the same forms appear in both. If you see senses and thought as separate, this seems incredibly mysterious (how can the "outside world" know that I was thinking that?) but seeing the two as arisings within the same mental space makes it more palatable, and is a better starting point for contemplation and theorising.

I'd be wary of thinking of things as literally being levels (although it's a handy way to visualise things); I tend to think it better to try to connect everything to direct experience in some way. So for instance, you might play with the view that all potential experiences ("3D frames" of experience) are always present, always in the background, and it's just that some are much "brighter" than the others, and so dominate experience. A bit like how the daytime sky is dominated by the sun, but actually the stars are still there. The only way to really investigate experience is, of course, to experiment with it, and see what happens. So long as we treat all experiences as just experiences, and don't get too caught up in the patterns we create (no "messages from God" or "signs we live in a computer simulation"), then this can only be beneficial, I'd say.

Q: Hi! So I tried both the owl and two glass exercise. You say that after you do the exercises you should move on with your life and think about the exercises as little as possible. I'm finding this hard to do because I have also been trying to cultivate my awareness for lucid dreaming (reality checks, questioning if I'm awake, trying to pay attention to details) so I find that my mind is trained to try to remember the details of my day (and dream content) and play them over. This makes it hard to let go and not think about owls or the glass exercise. Anyone else have this issue? Any suggestions on not overthinking?

You don't have to prevent thoughts about them - passing thoughts are inevitable, and that's totally fine. That's different from replaying things deliberately and tinkering with them. If you think of every deliberate thought as being a direct interaction with the world, then you can see where this comes from: A passing thought is simply revealing the state of you-and-world as it is; let them pass and they will fade. A deliberate thought, meanwhile, increases the intensity and therefore the contribution of that pattern; choose them wisely.

The pouring of that water is the changing of the situational pattern. Literally. Your work is done, so there is no need to revisit it. The summoning of the owl is the intensification of the owl pattern; no need to do more.

Main points -

- Let passing thoughts pass without intensifying them.
- If you are actively thinking, then treat those thoughts as a direct intensification of those thought's patterns and therefore their contribution to your experience.
- In general, if you are thinking actively, you should always be thinking from the end-state that you desire - not the start state or the process. Again, a thought=a literal increasing of the contribution of that pattern/state.

Q: Great thank you, that is very helpful!!

Welcome! There are all these "rules" that people have come up with over the years in systems like LOA, without giving the reasoning (or perhaps without even having a reason), so it's good to try and clarify. The key is to remember that this is a "dumb" process. You are simply turning up the dial on some possible experiences while letting other ones fade out - either directly (the owls exercise) or indirectly (the glasses exercise). There is no intelligence at work other than you and your intention. Be sure to report your results, here or in the other post as appropriate.

Q: I wonder how this would work with something that you can't give a specific image, because it's not an object or you just do not know how it looks like until you see it / found it. Can be also a person you didn't met yet. Any suggestions?

I'd say, you summon the feeling that would be associated with it. Just as picturing an owl triggers all experiences associated with an owl image, so summoning a feeling triggers all experiences associated with that. (That's why some people advocate just generating a feeling linked with non-specific phrases like "oh, it's amazing!" and "life is so wonderful!")

The fact that you even have an idea of something you want, means you already have some sort of sensory fragment. So imagine what it would be like if that fragment were being experienced right now - rather than the seeing of the thing or whatever.

Q: That sounds very plausible. It might be still difficult I guess, because I look for something I didn't experienced yet. I don't know what it would be like if that fragment were being experienced right know. All I have are assumptions. This makes it harder to recognize situations containing that fragment. I will try it anyway. Thank you!

I'd just intensify the fragment. That alone will also intensify the contribution of its extended pattern to your experience. Another trick: imagine that the air around you were being filled with the "atmosphere" of that fragment, its "essence". Feel that atmosphere become stronger and more prominent. Live with that as you go about your day.

Reality-shifting Retrospective

The post below is excerpted from page 15 of the stories section over at Realityshifters.com. I came across it again recently and figured others might find it interesting. It's not strictly dimensional jumping, but it covers the imagination => reality thing very well from one person's view. It was one of the first "hmm" stories I came across, after reading an old book on visualization which had also covered the "car parking space" thing mentioned, and it triggered the whole idea of an "ongoing updatable now". Enjoy.

Three Shifts

Nugo, El Dorado Hills, California

These are three shifts that took place just days apart.

- We live next door to a park and we were going to go play base ball with the kids and dog. My husband goes to the bucket to look for the MIT, bat and ball, and ... No bat, my son looked-No bat. I looked-No bat. I walked away and thought to my self "reality shift" and said aloud to myself I can shift this, the bat is there. I told my son to look again. There was the bat under a toy that we had all looked under.
- I was wiping off the counter in the kitchen and there was a bottle of soda on the counter with no lid on it. Looked around for the lid and figured it will show up. Well, it did! Right on top of the soda. My son who was standing next to me said, "That wasn't there before." It was fun to have someone else witness it too.
- Change of season for the clothing and I was looking for this sleeveless top in the closet. Went through each hanger 3 times, dug through all the drawers no shirt. I knew this shirt was there and I really wanted to wear it. I just stopped and laughed pushed back a hanger that I had pushed many times and ah ha! It was there!

About Shifting

I could go on and on about shifts in my life and I subtly knew about them but kind of dismissed them as oh well. All I have to do is Ask, "Parking space in the front please" and wait usually no more than 30 seconds and one always appears. I have been doing this for years unconsciously but now it is a conscious thing. You call it reality shifting but I call it manifesting. Everything we need is there for our asking. Once we understand that this is truly an illusion and it is ours to manipulate and direct through our thoughts many shifts can take place. This is why the power of imagination is so important and my big soap box is that our children are lacking time to create - i.e. taking all art out of the ciriculum. We are creators and it is through the mind-our creativity that we can manifest our reality. If I was of the conspiracy theory mindset one would think creativity has been slowly squeezed out of our lives because it prevents us from manifesting our given right to all information, all things and allows for others who understand this consciously and unconsciously to control. If we can think of it, it exists! If we can think of it, it exists. Once we realize this potential - or not even potential, this truth - that we have total control over our destiny, then, and only then can we make choices/shifts in how we live. Yikes! Frankly, that is a lot to ask for of most people. People like the idea that someone, something else controls their destiny.

How I Manifest/Shift

It is created with a thought. A very focused clean and clear thought. Then a visual image is formed in the mind clean and clear, then the request is made to the great cosmic goo where all matter is derived, it is brought down through the various frequencies, transformed through the power of the spoken word, and then the knowing, knowing that it is true. A key point is to know that it is true-already. Gratitude is always good, then just look to find it. Give thanks when it does appear. Your mother taught you that please and thank you are always good - it applies here too. Very simple yes, but the knowing part is for some reason is the hardest part to accept. Ninety-nine percent of the time I can request a parking space and get it at once. Ego says, "That was just luck." Reality says, "Just ask and you shall receive, it is all there waiting for you." There is no difference between a bottle cap, parking space, or baseball bat, or 10 million dollars. It all comes down to whether or not we know that this is what we truly want, and if we are ready to receive it into our lives. A bottle cap has a lot less impact upon our lives than millions of dollars -- but they are all the same energetically. They all originate in a thought and isn't that what everything is?

...

Q: I've often wondered exactly how different manifesting and shifting to another diminsion really differ.

Different metaphors for the same thing really: Changing your experience in a way that's beyond your usual. I suppose the different terms suggest different levels of change, how "reality-breaking" they are.

"Manifesting" tends to imply smaller changes apparently coming through normal channels. They can be "plausibly explained" but are just a bit unlikely.

"Shifting" suggests larger changes that you can't really explain away, because they are very hard to explain based on your knowledge of how things were.

Say you lose your wallet somewhere while out shopping (not a great example but let's go with it):

- Manifesting = "a series of coincidences means someone finds it and you get your wallet back". So lucky!
- Shifting = "your wallet materialises on the table, and everyone denies you ever lost it in the first place"

Q: very interesting, thanks for sharing
I tried this yesterday with a few things, but I have trouble at the point when it comes to "knowing that it's true already". I wanted to do the thought experiment, where you just turn off all your sensoric experience to get aware of what you really are, I simply cant get to the point where I dont feel my limbs anymore or dont hear anything.

On the thought experiment, you are just imagining what it would be like; that's enough to give you the understanding. On knowing it's true - try and view your experience as being a thought about a world. Just a very intense one. If you can think of something, it therefore exists, because reality is just a "bright and stable thought". Shifting is then just about letting the current dominant thought fade (detachment and allowing), and having a replacement take root in its place. Your experience right now is a thought and only exists as a thought; thinking of something means that the something must already exist and that it could become the dominant experience.

I appreciate the effort you take to answer all these questions you get asked.

Well, the gift that is mobile computing coupled with a love of metaphor mangling means it's not a problem. :-) And it's interesting to try and bring together all the old knowledge into a way anyone can understand, hopefully. I don't have all the answers of course, and everyone has to prove things to themselves, but I'm always up for sharing my thinking-so-far.

EDIT: Just added headings to make this a bit of a clearer read.

T-Rex Life Invasion

So really everything? An abstract example: If I can think of a T-Rex, does it mean I could really see a T-Rex outside? Sounds a bit stupid, I know.

Really anything...

So if you view everything as a "pattern" or a thought, then the fact that you experience it at all (as a dim sensory image when you contemplate it) means that it truly exists to the same extent as anything else does. There is nothing "behind" your present experience it; it is only a bright sensory thought. Therefore absolutely anything could happen. But, you have over time accumulated certain habitual patterns - formatting contexts such as apparent space and time; things you have ingrained which you might call facts-of-the-world. This is a good thing, because an unstructured world is no world at all. However, this dictates how much you have to detach in order to have a shift.

For instance, most people don't really want "discontinuities" - i.e. things appearing from nowhere - so what tends to happen is that they appear in a way that is "plausible", albeit massively coincidental. Perhaps they really want a particular object, but rather than it just materialising, it'll be in a place that they maybe didn't quite look hard enough, that there's some vagueness about, or a friend coincidentally calls that evening offering a spare one. You can usually feel your own resistance to stuff. Okay, imagine for a moment a T-Rex appears outside the window. What does that mean for your world? What are the implications? I bet you don't really want them.

But results are always guaranteed: If you intend a T-Rex with commitment, then you will find T-Rexes fill your life, in terms of art and television and overheard conversations and dreams and all sorts of oblique ways too, like news of a fossil discovery...

Which is where the whole idea of experimenting with creating synchronicity and The Owls Of Eternity came from, to demonstrate to ourselves that it is automatic, almost mechanical, and can be very direct...

Direct Avian Incorporation

Random not-great example of directness. Over the weekend I was listening to an ASC podcast about the making of Twin Peaks, slightly daydreaming, and there's a whole conversation about the red room scene and how they created the bird shadow within the spotlight. As the host says "bird" I have an image in my mind which clears and there's a bird outside the window exactly in the centre of my field of vision. Not a great example but what I'm trying to convey is the nature of the experience, that when

you're detached your thoughts can get directly incorporated into the thought-image of the moment. (Similar to this story. "Found object" stories in general have an element of this.)

You are truly not experiencing a spatially-extended world; there is nothing "happening" except for this current "sensory fact".

Aspects of Extended Persons

I read yesterday in this forum that we only see other persons as we determine them to be.

We have to be careful with the wording here - we are usually not explicitly specifying other people's traits, they are following "logically" from the pattern of our world we've accumulated to date.

When we shift an element of the world, the world stays self-consistent. If you make the world a friendlier place (say), people's personalities will shift to being nicer, but it'll be the "nice aspect of that person". Other times, people might disappear from your life because they don't have the aspect which corresponds to your intention, without them changing so discontinuously that it's beyond what you find acceptable.

The Evil Persons of Doom

But what is about people that want to hurt us / kill us, I mean it seems that it doesn't matter since we can't really die (according to some posts I read) but why would I allow this?

The main answer is: your world is stupid. By which I mean, it's just a collection of imagery and it doesn't know what images are "good" or "bad". In Biblical parable terms, the world is "unjust", meaning that it doesn't pass judgement upon your requests, it is actually an automatic and mechanical process. So if you have a view that the world is a dangerous place, then that pattern is overlaid onto the world and you will have experiences which correspond to (arise from) that pattern. Or bad people might come from the logical implications of another intention, etc. So you see it's not about "allowing". Like in the bird example, it's simply a case of what you are thinking being superimposed and incorporated into your experience, one pattern on top of another, to make a composite pattern which then unfolds self-consistently.

It doesn't matter since we can't really die.

The "conscious aware space" that we are is eternal, although all experiences rise and fall. So every moment is a death, in a way, it's just that we can't imagine the next-moment that might follow the last-moment of this body-pattern. Although we do dream every night, so we should have some clue. On the whole, I'm still kinda for apparently living a long life in this TG format, I must say. :-)

EDIT: Haha, yeah, well there's no way to get around that time talk nonsense, so I'm giving myself and "every-one" else a pass on that. :-)

But they [people and objects] won't disappear like "poof" from my memory or? For example they would say "Hey I got this new Job in New York I have to move away from germany" and disappear like this.

Yes, there would tend to be a plausible story happening. Not because there has to be, but because implicitly that's how you're continuing to pattern the world. The more detached you are, the more rapidly these things happen - e.g. next day someone calls up and they're leaving in three hours. It works the other way too: a friend you haven't seen in five years emails two hours after, with a great offer.

So I can only make objects, for example, appear when it's logical (win the lottery and get a car), but can't say I want a car to "spawn" over there?

But remember that it's your logic that counts. If you come to truly accept (both in terms of possibility and in terms of allowing) that objects can appear and disappear, then it will become "logical" that this can happen too. Do you think you can control the clouds just by deciding to? After all, the clouds are simply in your mind so there's nothing stopping you! If you don't really think you can though, then that means you are thinking you can't - and that thought will be true, in your logical worldview. (If that makes sense.)

There's also the thing that your world might shift right now to a different state and you will have no memory of it. Suddenly your green car is red, but there is no trace of it in the world of it ever having been green. If the entire state shifts including personal memory then it's just "always been that way". But that's not worth worrying about (except that you should always have in mind the idea that you want to remember everything that happens).

I hope my writing skills and formatting don't give you eye cancer, as you can extract from the text, I'm from Germany

Nein, alles gut, es gibt hier keinen Krebs - alles klar! ;-)
(Please excuse my bad attempt at German!)

...

An exercise to try:

The Act is The Fact - Part One: An Exercise

NOTE: I strongly recommend you don't bother thinking about this too much. Just go and do it. It works. Any ideas you might have about it are useless to you. Come back and read and contribute to the comments after you have done the exercise.

EDIT: Made a minor change to the instructions to clear up a potential ambiguity, 21-Sep-2015.

Although we often tend to view "dimensional jumping" or "reality shifting" as a specific event involving a particular act, in fact it is just a special case of a larger truth about the nature of experience. In everyday life we are usually oblivious to all of this, due to inattention, or deliberately ignore it, because its implications can make us uncomfortable. However, it is to our advantage to embrace this knowledge and there are simple ways we can leverage it for easy change. There is more to be said on that, and I'll follow this up with another post in future, but for now I'd like to encourage everyone to perform a very simple practical exercise.

Instructions: Two Glasses Exercise

Here are the instructions, which you should follow exactly:

- Choose a specific situation that you want to change, but one that you don't necessarily have much influence over.
- Decide clearly what the current situation is, and what the desired replacement situation is.
- Get two glasses.
- Get two bits of paper or labels.
- Fill one of the glasses with water.
- On the first label, write a word that summarises the current situation, and stick it to the filled glass.
- On the second label, write a word that summarises the desired situation, and stick it to the empty glass.
- With the two glasses in front of you, pause for a moment, and contemplate how your life is currently filled with the first situation, and empty of the desired situation.
- Then, when you're ready, pour the water from the first glass (the current situation) into the second glass (the desired situation), while really noticing the sounds and feeling and shifting of the water from one to the other.
- Sit back and see the glasses in their new state; allow yourself to take deep breath and feel relieved.
- Drink the water and enjoy the satisfaction of having made the desired change.

- Take off the labels, put away the glasses, carry on with your life.

One thing I'd like to emphasise is that you will get results here, so if you do decide to perform this exercise:

- **Please take this seriously and only choose a replacement situation that you will be happy to live with.**

...

Q: I've always been able to make myself sick (think going home from elementary school) .. I could convince myself that I had a fever even though I was fine and then the thermometer in the nurse's office would read a temperature. I have always felt like I had some control of my world, but I never went beyond making myself sick. (What a great use of my energy!!!) So, I've been suffering from some terrible fibromyalgia like pain for about a year. My assumption has been that it's stress related since I'm fairly healthy and have a clean bill of health besides being slightly overweight. I'm also a first grade teacher and being in constant, exhausting pain is not exactly conducive to the work environment. So, I decided I would try this experiment about two weeks ago. On one glass, I wrote "pain" and the other I wrote "health". I tried to be very careful with my wording. I set my intention, did a few cleansing breaths, and poured the water. Then I moved on with my day. As of today, I have had no serious back pain since that day, and only slight tingling/aching after bending or crouching for too long at work. No feet that feel like stepping on glass. Love pats from my son don't feel like he's punching a bruise. I told my partner that even if it does come back over time, at least I had some relief!! I'm VERY satisfied with my results so far.

Hey, that's brilliant news! Really pleased to hear it! And, of course, I'm slightly amused that you spent your childhood using your "infinite powers" to make yourself sick. Kid logic eh? ;-)

Q: This is Wiccan spell casting 101.

For sure - or rather, it has common elements, without the unnecessary (or rather: optional) cultural baggage. It is simply meant to provide a useful experience for those who would not otherwise encounter it. (And it's a bridge to a more generalised version.)

Q: It's all quantum consciousness and fractal spacetime in the end :) whatever method works is what works!

Spacetime?? A mere fairytale! Those darned "quantums" do seem to get everywhere these days though. ;-)

Q: as above, so below

Hmm, I kinda think that phrase is a block to understanding for a lot of people, just because it immediately causes them to think in terms of a spatial relationship (even if it is a metaphorical one), which separates out two aspects which are not separate. But then, that's probably to take it too seriously anyway.

Q: A theory of everything has to include everything. ;)

And that includes the theory itself! :-)

Q: So this is what wiccans do to cast spells?

Well, they use the idea of associating objects with things within a ritual.

Q: Okay well the reason I'm asking is because I am a Christian believer but I still like to consider and ponder the thought and possibility of multiple dimensions and I personally don't believe that the two have to be mutually exclusive however, being a person of a particular faith I don't want to be practicing spell casting so that's why I was asking.

I see. No indeed, they don't have to be mutually exclusive at all. In fact I'd say the essence of the Christian faith is perfectly aligned with this (although we're talking New Testament God rather than Old Testament). I'd suggest that the "mechanism" behind this, such as it is, is precisely the same as that which underlies traditional prayer. In other words, it is "with God" rather than a manipulation of the world in opposition to God.

Q: Hey, tried this two days ago. From all my attempts so far this exercise was the only one with results. Its not the exact solution to the unwanted situation I had in mind when I did the experiment though (it would be a huge jump, like change past events), but its a small, positive development, and it could lead to my desired situation. Nothing is yet guaranteed though, I'll have to wait a few weeks. I did it just as you described, I didn't meditate on this or thought too much about it, just decided the outcome, emptied the glasses, threw the labels in the trash and forgot about it for a couple hours. Later that day I received some good news about my problem. Should I keep doing it or once is enough?

That's good news! Once is enough, because the change has now made. It's like changing the TV to a channel that will be showing your favourite show. Once you've switched channel, you don't have to keep switching channel - it's done. Now you just have to carry on pottering about until the show comes on.

Q: Interestingly, the ideas you propose here are consistent with the writings of physicist Max Tegmark, which you perhaps may already know. However, he does not go so far as to suggest that it is a phenomenon that can be tested and/or manipulated. I.e. he proposes that the basic substance of our universe is a sort of mathematical object, but stops there and does not make the final step to equating that object with the Akashic Record.

Yes, I've read some of Tegmark's work with interest (and he's an entertaining guy).

EDIT: It's been a while, so apologies if I'm misrepresenting his approach.

From memory, where I'd differ is that he still views the universe as a "thing" and that it is "made from" structures which have an independent existence, and his treatment of consciousness as a state within that. There we, once again, take the information processing metaphor as "real" and independent, and place consciousness within that. The universe still seems to be a "place" rather than a idea or pattern which formats experience. Tom Campbell takes a similar approach, although he does suggest that intention can select outcomes; it's just that he binds himself with the concepts of probabilities and rulesets, as if they are independent system properties "out there", and implies intelligence in that beyond ours.

In our approach, we recognise that all narratives are abstract and arbitrary; they are experiences like any other. There is no fundamental structuring at all - except what we adopt as consciousness. We are intelligent, patterns are "dumb".

And that's why we can test and manipulate it - we've got it the right way around. Recognising ourselves as unstructured consciousness which has "taken on the shape of" particular patterns, we are free to "shape-shift" in order to change state and select the form of subsequent experiences.

The problem is that this requires some faith of a sort:

You have to actually do a "shift" in order to experience a state change and thereby prove to yourself that patterns are arbitrary. If you try to work this out intellectually from your current view, or investigate without actually intending results, you'll just continue to have experiences from your current state - confirming your current state. That's why there's the Two Glasses Exercise above and the Owls Of Eternity synchronicity exercise. Easy stuff that hopefully gives people the experience. Then they can play with reformatting themselves with whatever "active metaphor" they're attracted to (Hall of Records, Infinite Grid, Imagination Room, etc). I think if Tegmark (or we) reinterpreted his description as "experiential formatting" then it could be quite a powerful enabling metaphor.

Coincidentally, there was a programme featuring Max Tegmark about "the multiverse" last night. It wasn't very good at all, but I'd say Max came over best out of the four scientists featured.

But his approach is still very material, and seems to miss the obvious follow-up question...

Yes, that's the thing. Tegmark essentially gets to the "patterning" approach, but then insists that those patterns are somehow "external" (the problem with all simulation and information models). If he just made the step to saying that these patterns are modulations of consciousness, that there is no "underlying", he'd be pretty much there. I can understand why he'd be reluctant to do so though. (He's also bound by viewing the world as a "place" I think.)

Other physicists such as David Bohm have gone there - as did many of the early 20th century physicists. But at some point there's risen the tendency to confuse our abstractions as being objects rather than narratives. (See Mermin.)

Sam Harris is okay as an engaging speaker, but he doesn't really get to the bottom of it. His conception of self is of "this person" but he doesn't follow it through and arrive at the context of experience. I think he confuses "consciousness", "consciousness-of" and "self-consciousness" - which is why "awareness" is a better word perhaps for the "non-material material whose only property is being-aware". He then ends up in a corner when it comes to things like free will. We have to remember that this crosses over deeply into philosophy, and neuroscientists tend not to be that well-versed, and even with the physicists there seems to be a trend towards ignorance of the fact that all models have an implied philosophy whether recognised or not. (See George Ellis for comment here.)

A better bet in my view is cognitive scientist Donald Hoffman's take (see TED talk), with interface theory and conscious realism. It still implies an "external environment" of some sort which I disagree with, but the rest of the picture is interesting. (If you get rid of space, there can only be internal environments - or actually, "dissolved" environments.)

Yeah, it is the ultimate mind food... with mind as its ingredients!

Q: Hello guys! This is my first post on the sub and also my first ever comment on reddit! I'm really skeptical of these types of things even though I research them and hope that they are true. Could this method work for any change? Any significant change? I'm transgendered. I haven't done anything at all yet for transition. Could I use this method to switch to a dimension were I am actually a woman?

Potentially any change, although this method is going to generally produce results by "plausible if very unlikely" means. In other words, that's a pretty big discontinuous change for this zero-prep approach! Although you'll tend to get results of "some sort" anyway even for "impossible" things.

Q: I did the Two Glasses Exercise today. My wife has been quite sad (hormonal), on and off for over a year now since our second child was born. It's tearing me apart and it's difficult to get her to get help. I've witnessed the worst part of SSRIs and often it's trading one problem for another, so I'm opting to silently set some intentions. Wish me luck. I'll check back soon once I determine if it worked.

Hey, my thoughts are with you on this one. Friends went through something similar and it was very distressing (all good now though). Consider "luck wished".

Q: It's working!

But of course! Once it's complete, do post your results (you don't have to go into specifics if it's private, just the general idea of what you chose and how it happened for you). Once there are a few in, I'll write up the second part of the post.

Q: Question -- can you change a past event with this method? I truly believe that all events, possibilities, experiences to infinity are concurrently happening. There is a singularity where everything comes from ... everything that could/has/will happen on every level macro to micro is all going on at the same time. We (or I) seem to choose one "time stream" to exist in. It would make sense that I could "jump" to a dimension where a past event never happened and my reality changes to reflect that.

Well, the above method is intended to be a demo that gives "plausible if very unlikely" results, although people have used it for rule-breaking outcomes. Give it a go. Meanwhile, if you check out the introduction post, there's a link to Neville Goddard and his "pruning shears of revision" in the edits that's worth your while. In terms of your model, I'd throw away the notion that everything is happening at the same time and that there are time streams and so on. Throw away the idea of an unfolding world, and instead go for something quite static. Perhaps go with something like:

- Every possible "moment" of experience is present in your perception right now, like an infinite stack of photographs of the world, all being displayed simultaneously.
- However, they are of different intensities.
- The intensity of a "moment" dictates its contribution to your experience.
- The "moment" you are experiencing now is the "brightest" in the stack.
- The "moments" you have previously experienced are still quite bright and shape your ongoing experience.
- To change the so-called past is really to reduce the brightness of a particular moment, now, so that it is contributing less to your ongoing experience.

So, a stack of photographs (or more generally: patterns or facts), each contributing to your experience, change the relative intensity to change your apparent world.

Q: Just did the 2 glasses experiment. I have a lot of anxiety so labeled my first glass and current situation as "anxious" and the desired outcome "less anxious". I will check back if I notice changes. A question though, is there a limit to how many times you can do this exercise on the same situation perhaps altering it slightly? How many times can you do this exercise for different situations in your life? Thanks!

You should do it once for a situation, and then let it settle out. If you keep doing it repeatedly for the same situation, you are just constantly changing state. Remember: the change happens at the moment you do the exercise; it's just that the you don't necessarily encounter the evidence until later. In other words, future events are set in place when you do the exercise. There's no limit to how many times you apply the exercise for different situations - but you should perhaps leave a gap between each use, because things might get a bit unstable if you do it a lot, without letting things settle a bit after each time.

...Well, when you want a change, then something else has to change too, and there will always be some collateral shifting to keep the world coherent and "plausible". And that's a good thing. Generally, if you're feeling superstitious like that, just have the additional background intention that things should work out the best for everyone. But your real problem is that you are full of "whatiffery". But what if this or that. Well, what if something really great happens?

When it comes to this stuff, you shouldn't be planning or second-guessing at all. You simply do the exercise, then consider it done at that moment and carry on with your life - the results will come to you. Really, you should start treating all your thoughts as direct interactions with the world. Don't spend time deliberately thinking anything that you don't actually want. Passing thoughts are fine; they're just fleeting ripples. But to intentionally think stuff you don't want, would be... an error. Y'know, all of the religions and magickal traditions have some concept of "faith" or "surrender" - this is what they mean. You have to simply trust that, although you can't see beyond the horizon of the present moment, that your intentions have already been incorporated and will come to you when the appropriate context arises. Trust it. (There's really no other solution.)

...For sure, but - you should be careful what you wish for, and choose carefully. "Diligent" (conscientious, attentive, productive when required) definitely sounds like a better idea than "hardworking" (swamped by obligations?). Be mindful of the village girl, in terms of being specific.

*Q: **instructions, which you should follow exactly**
I've a problem...
I sense negativity in the first glass, the unwanted situation. So, to my mind, pouring that tainted water into the second glass would be like contaminating the desired situation.
What can I do?*

If the water is consciousness, then it is inherently pure and can never be tainted in a fundamental way. However, if you feel that the water as you think of it might retain a "memory" of the previous situation, it makes sense to go through a process which involves purification or filtering. There are many different ways you might do this, so choose the one that feels right to you:

- Get a sieve or a strainer. Simply recognise that this has the property of removing residual situational elements. When you pour the water into the second glass, do so through the strainer.
- Or; Pour the water from the first glass into an empty kettle. Boil the water to cleanse it, before pouring it into the second glass.

- Or; Pour the water into the new situation glass as described. Now, put a water purification tablet into the glass. This will cleanse the water of any residual effects of the previous situation.

Q: The "water is consciousness" clarification did the trick and aligned my mind with the correct meaning of the metaphor. Now the negativity seems somewhat confined to the solid part of the glass (a dented glass, for example, is bad but cannot stain the water)
Thanks!
I'll keep you posted on the results.

Great!

You could perhaps treat the glasses as mere clumsy physicalities of the ideals they represent. In other words, dents and so on do not matter, because it is the "container" or "location" property of the glass that is active here, not any other properties.

Q: What if the water is already purified? Is the cleansing process more of a symbolic thing? Thanks

Really, you don't need to do this. It was just to allay someone's fears. Just sticking to the main instructions is all you need.

[COMMENT]

A1: I sense negativity in the first glass, the unwanted situation. So, to my mind, pouring that tainted water into the second glass would be like contaminating the desired situation. What can I do?

I truthfully don't consider there to be anything wrong with acknowledging the fact that we are currently in an undesirable state. I've been downloading Neville Goddard a lot recently, and he might disagree, but hear me out on this. As a real world example, I have a cold right now. I am using the present tense; I HAVE a cold right now. I don't want a cold, but I have it, and I am not yet good enough at what Neville teaches to get rid of it in five minutes' flat. So instead what I am doing, is the only practical thing that I can do right now. I drank lots of vegetable juice and took a herbal remedy yesterday that I have found in the past to be effective, and I am drinking lots of water, and sleeping when I need to, etc. I'm also, however (and here is the important part, from an LOA/Goddard/dimensional jumping point of view) releasing as much emotional resistance to the current fact that I have a cold, as possible. I am not emotionally attached to the fact that I have a cold. As a result, my condition over the past 24 hours has improved fairly dramatically. Yes, I still have a few of the symptoms of a cold, and might do for another day or so yet, but I'm not allowing myself to care; because caring about a given state is the main thing that keeps me attached to it. The cold will go. Not instantly, perhaps; but with time. I also used this both last night and earlier this evening, and it worked fairly quickly both times. I live in a place that has chickens and three roosters, and last night they crowed for a good portion of the night and kicked up a real ruckus. Given that I was unwell at the time, cold, and needed sleep, that did not please me at all. So while feeling fairly intense irritation towards the roosters, I practiced my usual method of first mentally seeing a doorframe through which I could hear silence and no roosters crowing, and walked through it. Absolutely nothing happened. I tried it probably 3-4 times, and the roosters just kept on crowing. So I stopped, and took a different approach. I forced myself to release all of the emotional resistance I had towards the roosters crowing. I told myself that the roosters could crow all night if they wanted to, and I wouldn't care a bit; I'd put the fan on to drown them out and just sleep right through it. The roosters stopped crowing less than five minutes later, and I went to sleep. Flash forward to this evening. Given that I'm in a hostel, the main building has very thin plaster walls, and thus noise from one room, penetrates to all of the other rooms. Although I later got up again, at the time I was once again trying to get to sleep, and there were noisy children in an adjacent room. Again, same situation; I was sick, cold, wanted to get to sleep, and became annoyed with the children. This time, however, I remembered the result with the roosters, and simply went straight to the detachment phase. It worked like a charm. The kids were a bit persistent at first, but they still noticeably quietened down in about a minute. After about another five minutes, they were silent. This is where the guys over in /r/Buddhism are missing the point. Nibbana is not about you ceasing to exist; it's about your attachment to your current situation ceasing to exist. The secret, in the most literal possible sense, is learning not to give a fuck. As Patanjali wrote several thousand years ago, when you are indifferent to Nature, she becomes your slave.

[<https://www.youtube.com/watch?v=e0ZAOFC9f84>]

"Now we will tell you that thought creates form, and with emotion you vibrate it into being." -- Wendy Kennedy, in the above movie, channelling the Plaeidians.
So don't deny your current situation. Denial is resistance, and resistance is emotion directed towards the undesired state. What you get is what you feel emotion towards. What you do need:-

- **Tenacity.** I am going to use the word tenacity where Neville Goddard uses the word faith. I truthfully do not like faith as a word terribly much, because to me it is fuzzy. You want something with a practical operating definition, where you can actually feel the word's definition when you say it or think it to yourself. Determination or tenacity is one such word. Grit your teeth and set your jaw. Now, this is also very, very tricky. You do not want tenacity specifically towards your desired outcome, because that will again announce to the system that a} you aren't in the situation you want, and b} that you care about that. That will screw you up. What you instead want is tenacity about the idea that you are going to get what you want, but you very deliberately leave out any specific details about "what you want," means. I'm not attached to the roosters crowing, or any other specific outcome. I'm only attached to the idea that I have what I want. No specifics. To go back to the earlier example, I genuinely didn't care about whether or not the roosters stopped crowing. I made the decision that I was going to sleep no matter what, and the roosters could do what they liked. This level of generality also gives the system room to give you what you really want, not just what you might superficially think you want. Another example. I am not currently as good at this, as Neville Goddard himself was. I'm just starting out. That is completely fine. I can admit that and not get my nappy in a twist about it at all. I also already know from direct experience, however, that Neville's tech (to borrow a Scientology term) works. So from that, I also know that I am going to end up just as good at this as he was himself. It's a done deal. It's just a matter of time. Resistance is futile. Neville mentions that there is often a time lag for things. Don't get hung up on that.
- **The ability to turn your emotions on and off on command.** You do not want to get rid of your emotions entirely. Emotional attachment is the fuel which keeps you inside the entire karmic system. If you want liberation, then sure, scrub your emotions completely. Total lack of desire or attachment is what will derail the karmic train, and let you out. I don't necessarily want to get out just yet; I'd prefer enjoying some time playing the game with God mode first. But think of your emotion as electrical current, and emotional detachment or indifference as a circuit breaker. Meditate regularly, because that will help you get to the point where you can decide what you do or do not want to care about. I can still know on a purely intellectual level that I'm not yet where I want to be; I just have to make sure that I don't care about it at all, emotionally. Nonchalance is the old word that used to describe that state.

[END OF COMMENT]

A useful word here is "distinction". **The distinction between you and a distraction, between one part of your experience and another, persists it.** For as long as one part is perceived as "other" then direct intervention doesn't do anything. On "faith" - it's a ruined word now, but Neville Goddard's use is about right: it's an "assuming" or "knowing" that something is the case. The process works, simply use it. When you turn a door handle, you push the door simply assuming it will now open. If you later notice the door has become closed again, you simply turn the door handle and open it once more. In the same way, when we make an adjustment to the world, when we put it into a certain state, if we notice it has drifted or reverted, we merely return it to that state. At some point, the door stays open, the state becomes fixed.

Q: I drank deeply of the tall glass I used, so deep it was one chug and my physical thirst is quenched. I feel this is good. Worth noting, maybe? The series of links that took me to this thread coincided with a few ear ringings. Two in the left, one in the right. I don't know if any of you are aware of the significance that ear ringing holds in the occult, but either way, thought I'd say so. I am interested to see the result.

Interesting. What matters is the significance these things have for you, really. But it sounds like part of a larger narrative. Looking forward to your results!

Now my question is...do I have to stop thinking about our lost friendship for a while? Do I keep my mind as blank as possible for the next couple of days?

Just know that it is already done. You have literally updated the state of the world by doing this exercise, and you will encounter the evidence of this in good time. Would you think about something that was already a done deal? No, because thinking is for things which are uncertain or regretful. Passing thoughts are fine, they are just like leg twitches. Would you obsess over a leg twitch? No, it's just a passing distraction. So treat thoughts about this area like that - dismiss them with an "it is already done!" and continue with whatever it is you are doing. Aside - you should never deliberately spend time thinking about anything unless it is for the purpose of inserting that thought-pattern into the world, because that is what you are doing.

So, all of the above is the reason why the last instruction is to "carry on with your life"!

Q: Thank you, this was all very helpful. However, there was one thing thing you said that I need clarification.

Aside - you should never deliberately spend time thinking about anything unless it is for the purpose of inserting that thought-pattern into the world, because that is what you are doing.

I'm not quite sure what you mean by this. Am I creating some unintentional repercussions by thinking 'I wish we were close friends again'?

I hope I can provide an update next time I post!

It's fine if such a thought arises, just appears in your mind, and you let it pass. But you shouldn't deliberately think it. Don't get hung up on this though!

First of all, why would you do that anyway? It's a superfluous act. Talking to yourself like that surely isn't healthy. ;-)

In this particular context though, you are making a declarative statement of fact which, by its nature, activates the extended pattern associated with it. This happens automatically since it is required for the statement to have meaning. If you say "I wish we were close friends again" you are literally triggering the experiential pattern of "wishing you were close friends again", which implies the fact of not being close friends. You are persisting the state of "wishing" and of "not being close friends". This complication is why the exercise is constructed in the way it is; it avoids all this formulation stuff and just accesses states directly, shifting their intensities.

Summary -

- Statements are not just observations, they are assertions which trigger the corresponding state, intensifying its contribution to your experience.
- Do not engage with any thoughts which arise that are contrary to your desired state - don't fight them or explore them, just let them pass.

Q: Hey, so this probably means nothing, but I've been having intense dreams lately. So, we're not close friends yet but I'm still patiently waiting to see if the glasses experiment worked. But I've been having a very vivid dream in which my friend and I are close again, and when I woke up I was still able to resume that dream the next time I fell asleep! And this happened twice already. This has never happened to me before. I also saw a large owl in that dream.

Sorry for the lackluster update!

Interesting! Thanks for the update. Hopefully more to come on that. Yeah, those owls get everywhere, once they've been summoned, a good sign.

Q: Deleted

That's a good one. Was having a conversation about collateral shifts elsewhere. Copy here in case you find it a useful way to think of this:

Factual Updates and Collateral Shifts

If the world is a continuous and coherent pattern, a blanket of material with folds as facts, then you can't adjust one fact without tugging a little on the rest of the material, impacting the other folds. Although these "collateral shifts" would make sense in terms of the fundamental nature - the blanket - they wouldn't follow the logic of the world's apparent content - the folds. For instance, your car tumbles off the side of the road but - flash! - suddenly it didn't happen after all. Changing that fact inevitably results in a collateral shift of the world as a whole. But it takes the form of, say, an extra tin of fruit in your kitchen cupboard, a news reporter's hair being parted at the other way, and an acquaintance you've not seen in 10 years now never existed. Those changes are causally linked to, but not logically linked to, the event. Quite possibly you would never encounter these updated facts. However, the change in your felt-sense of things - that "global summary" sensation that you have - might mean that the world sort of "tastes" different subsequently. You intuitively know that you are no longer in the same place. There's a different "flavour" to your life after the accident somehow.

Q: Hey man, thanks for sharing all this wonderful information. It's really fascinating. So with regards to this exercise, let's say for example I wanted to change something physical such as growing slightly taller.

Would it be safe to do such a thing if I am happy to live with it?

Hey. You can try it for anything you want, there's no danger with it because it doesn't attempt to force a change - things will seem to appear by "plausible if very unlikely" routes. You can't tell in advance how it will play out, but you always get results of some sort. Give it a go and see what happens. (But do follow the instructions.)

Q: Part Two?

...still to come, once the people have had time to play.

Q: When do you think there will be a part two?

My thought was to leave a few months after the first post. The idea is that the second post goes more into the concept behind it and, from there, where else you can take it. If I did the follow-up too early though, people would be less likely to blindly follow the two glasses instructions, and would try to second guess themselves "doing it right". Without the further discussion, there can be no danger of confirmation bias in terms of having a theory of what, exactly, is meant to happen; it's easier to be honest with oneself.

Q: That is really true. I just thought maybe there was a second part relating to actions we can take, rather than just an explanation or further information at to why this works.

Thank you for the swift response :)

The second part will point out the relative arbitrariness of actions, and the primacy of assigned meaning. I've already ended up talking about it in discussions under other posts really, but want to gradually build up a set of posts which are look-unable, from me and others. Swift response=distraction from tedious other project. :-)

Q: Haha, that made me giggle. I guess I will go stalk your profile and see what you wrote before. :)

Heheh. That would be a long slog. The essentials are something like (haven't got the exact wording here):

- Shift=Detachment + Intention + Act
- The assignment of meaning to an act is what gives it casual power.
- Experiences gain causal power through accumulated meaning, establishing habits.

Q: I have found what you said to be very true. The more significance you give something, the more you become attached to the outcome, the harder it is to shift to a place where the outcome is reality. I think for most people, the hardest part is detachment. That is definitely the part I struggle with the most.

Yes, detachment is the vital thing - or better said more recently, perhaps: non-attachment. This amounts to:

- Ceasing to interfere with the shifting of state or the unfolding of experience.

If you are completely open to shifts, then you get to "just decide" change - simply intend. Of course, if you want any stability to your experience at all, then you don't want to completely eliminate all structure. So it's more about adopting an "active metaphor" (a metaphor which acts as a base patterning on your experience), such as the imagination room, which provides flexibility but still enforces a high level of coherence.

...

Not easily noticed... except by the author! (I kept my inbox replies going on this one.)

Of course, it can be adapted. It's about anchoring world-states and there are lots of ways to do it. The reason for the instructions being as they are, is that it's immediately intuitive to most people - it doesn't need to be thought about, and hopefully it doesn't really occur to people to think about it. What's important is that you assign meanings to the configurations and to the act, so that they are attached to the states. You can even do the exercise using your imagination also! But there's a reason to use explicit 'external' objects and have them distinct from yourself. People's body volume tends to be a mass of muddled meanings, and there can be a confusion about where "you" are

relative to the situation and what you represent during the exercise. Simple objects like glasses and water, meanwhile, are relatively pure in terms of their 'extended patterns', and the assignment of meaning tends to be much 'cleaner'. (Although you might still notice some synchronicity involving water-filled receptacles and notions of 'transfer'.)

Q: Are there any side effects that happen when you do this? Such as immediate exhaustion or dizziness?

Yep, those things can happen. Remember, this is about a change of state of the world - and since "the world" also contains your body, then that is part of the shift. Your experience is local and your intention here applies globally, but global changes can also involve immediate local changes.

Q: So maybe I don't fully understand the experiment, can someone help me determine what is a possible scenario? Say, I have school today (the only day this week since Thanksgiving is coming up and I'm in University) and I want to eliminate school today. If I labelled glass A: "School Today" and glass B: "No School Today" is that a plausible idea? I am skeptical of the idea regardless, but could you do it for anything or are there specific rules to follow that I am missing?

A guideline proposed before for this exercise has been: "for outcomes that are plausible but perhaps very unlikely". In other words, they must make logical sense in the world - no discontinuities against the physical "habits of the world" - but can correspond to very remote chances within that boundary.

Q: I'd be happy if somebody helped me, So my p.c. Is broken and I want it repaired. So what word do I use to summarize my situation? Am I allowed to use multiple words? I thought about going with "pc broken". I'd appreciate any directions. (My pc basically suffers from "Hard-disk failure")

The word comes from your own contemplation of the situation. You think about the situations, and ask yourself what words best captures those, feel appropriate, and then use them. This is not about "sending a message to the universe", so it's not about writing a description of what you want (like to Santa Claus, spoilers: Santa is not quite real). Rather, the words are "handles" onto the situational patterns that are dissolved into the background right now.

*Q: Possible dimensions I could see myself using this to jump to.

- A dimension without mobile phones. This would be my main priority. At this point it isn't so much that I want to get rid of mobile phones, as much as I'd like to go to a few dimensions without them, purely in order to see whether or not society really needs them.
- A dimension without Google. We don't need Google, because search engines existed before it did, and I consider Google megalomaniacal and undesirable. Truthfully a dimension without corporations more or less in general would be nice. I could live with building my own transistor-based computer; if you use breadboards or similar instead of PCBs, it isn't all that hard.
- A dimension without transhumanism. This would also require large chunks of the twentieth century's predictive programming science fiction to cease to exist.
- A dimension where either Hellenic polytheism or Hinduism are the global majority religions.
- A dimension where the natural environment is in much better shape, and is actually valued by the majority.*

Hmm. Well, the exercise in this post is really about shifting specific personal situations in your current world-pattern. Which is not to say you won't get a result if you use broader terms, but the effects may not be quite what you had in mind...

Have you looked up persistent realms? If you just want a quick look-see of what dramatic alternatives would be like, without disconnecting permanently, that's the way to do it. Interested though: your list seems to be fairly counter-technology. What's the thinking behind that?

Q: I'm definitely interested in the persistent realms link, but it doesn't seem to be working for me.

Hmm, just clicked and it's working for me. What are you getting?

Q: The page doesn't load. Maybe it doesn't work on my phone.

That's probably it - it's a forum post on the Dream Views website. Works on my tablet and desktop, haven't tried it on mobile but the formatting is quite crazy so it probably wouldn't play nicely. It begins:

[START OF POST]

What is a persistent realm?

It's a term I use to describe certain kinds of dreams I have. Dreams that are persistent, meaning where your actions have consequences, dreams you can resume each night where you left off. So why do I call them "realms"? Well, for me these kinds of dreams are a bit more than just persistent. There are a few more unique characteristics to them:

Persistence - When you "enter" a realm, you "resume" the dream where you left of last time. (more or less)

Consequences - Because of the persistence, every action you take has consequences. If you change something it will remain changed forever. For example, people will remember you and the conversations you've had with them. Laws & Dream Powers - A realm has a set of laws of physics (fitting the setting of the realm), which may be different from waking life. There may be ways to cast magic for example. You can learn, understand, use (and abuse) these laws, but you can never do anything that violates them. (Such as using dream powers) If a character does something ridiculous then it means that there is a law enabling him to do so, and you most likely can learn to do the same thing.

Realism - Those dreams feel pretty damn real. I assume the main reason behind this (besides the technique I use) is that all dream characters are intelligent. You won't encounter the typical "derpy" DC who seems completely lost. DC's are intelligent and follow their own agenda. Their actions can be completely unexpected.

[END OF POST]

It then continues at length. You'll find a nice overlap between the poster's ideas for creating realms and experiences, and some of the approaches we discuss here. Which makes sense of course: this world is an immersive, persistent realm too.

Every piece of consumer technology released since 2000 that I've seen, seems to reduce the sum total of individual autonomy and control that the user has over their own lives.

I agree this has been the trend, although I think it is a natural side-effect of technological development. That as electronics becomes discrete, and protocols are encapsulated within protocols, we multiply our ability to create complex things in simplified packages, but we lose the "tinkerability". That's okay in and of itself, but it has implications, as you'll agree I think:

- Hurdles to Access - Fifty years from now, anyone will still be able to rig up a basic record player and play a vinyl album. To play a CD, you'll probably need to build a semiconductor fabrication plant first. To access that file that nobody bothered to write an converter / interpreter / emulator for, you're stuffed.
- Reduced Transparency - More important though, is that more stuff is happening "elsewhere". When thing reach a certain level of complexity, you simply can't examine the details for yourself, and when storage and transfer occur beyond your sphere of vision, your own information ceases to be under your direct control or awareness.

The first one is nothing new, it's been going on for years. It's the second one that's problematic. The technology itself isn't a problem - it's the creation, ownership, and conflation of "data doubles" and an attempt to capture that development that is the problem. But I'd say this is more about politics and people than it is about technology. I think that's where the solution lies. The gentrification of the first wave of technologists is not helpful here, but I'm pretty hopefully generally. And I have a certain morbid curiosity when it comes to these things. Which is, of course, why I am participating in this "subset" in the first place.

Meanwhile: yes, Neville Goddard works but really there's a more general sense in which you can work with this. If you just want out completely, then it's worth your time playing with the persistent realms idea. I see suicide as the ultimate in "undirected jumping" and is absolutely not recommended. Of course, what you should really do is stop engaging with this aspect of your experience - because the more you get yourself all irritated and annoyed about the direction of this stuff, the more it's going to whirlwind around you in an ever-accelarating storm of synchronicity...

Q: are you people serious-?

It's easy enough to find out, right?

Got a couple of glasses? Got water on tap? Is there a specific situation right now that you'd like resolved but can't think how? Then you're all set to try the exercise for yourself.

Q: Can this change things that involve people other than you? If I wanted a relationship, would I put "single" on the undesirable, and "partnered" on the desirable? Or if I wanted to lose weight with this, how would the transition work? Would I wake up and just be in shape if that's what I wanted? Or would it start dropping weight over the course of a few days?

Yes, you can do the partner thing. Anything within your subjective experience (which means: everything really) is up for grabs. For this exercise, the nature of transition will tend to be "plausible". The main point here is to demonstrate something to yourself, something essential about the nature of your experience.

Q: Question: should I continue to revise my day as Neville Goddard has suggested after doing this, or would that be considered interfering?

That's an interesting question, and I guess it depends a little. But in general I'd say go ahead, that's fine, because the exercise above should in any case about situations which are a bit more remote from your immediate influence. When revising the day you are looking at the specific subjective scenes which unfolded, rather than the larger world. For instance, revising the scene where you argued with your brother at his house isn't going to affect the pattern associated with that business deal in Ohio - etc.

Q: So even if my focus of the two glass experiment was a better relationship with my brother, revision would be more of a help than hindrance?

I'm suggesting that you do the exercise for your relationship with your brother, then let it play out (knowing that it's sorted) and don't micro-revise that relationship. (I mean, you'd rather just have a good relationship, right?) Instead save revision for "course correction" of things like reversing a bad meeting at work, etc.

That way you are changing the situation as a whole, as well as properly demonstrating the approach to yourself too.

Q: Oh, okay! Thank you for the clarification!

No problem - good luck and remember to post your results!

Q: question, I'm seriously thinking about trying this out.. there's this girl I really like we used to talk but things didn't work out for some odd reason? She just stopped talking to me it was so sudden. Long story short she's with another guy now but I cant stop thinking what could have been if we had dated. so what I'm wondering is if I were to put "She doesn't talk to me" and "She wants me" on the cups, is that sufficient? or do I have to be more specific and put her name and what not.

What matters is what the labels mean for you. They don't need to be detailed, they just need to capture the essence of it for you. You aren't "sending messages to the universe" here; you are basically attaching those world-states to the glasses.

I would make a suggestion here: you should be more clear about your actual target situation. Is it really that you want her to want you? She can do that and you'll never know about it. Or do you actually want her to be your girlfriend? Your labels could be (choose your own, this is just my examples): "Estranged" and "Together" or something like that.

Q: This might be a dumb question, but, is this something that would work for multiple things? Say I have 2 things I want to change. Could I do it once for one thing and then do it another time for the other?

No, it's a fair question. Yes, every time you do the exercise, since you are approaching it with different situations in mind (and on labels), it's a "fresh" event. But it's best to leave some settling time between sessions, like a week after each one, I'd suggest.

Q: That's great to hear, since there are multiple aspects I'm interested in improving. I'm still contemplating whether or not to give it a try.

Well, the whole point is that it makes a great demo exercise just to see if there's "anything going on with this stuff". So try it on something like a personal situation that you'd like sorted, but which you have limited power over, and isn't too intense - and see what happens. It's better to play with these things before you really need them. There's a tendency for people to suddenly go "hey I need to sort out this really important thing", which makes it harder to follow the last instruction.

Q: I guess I'm just concerned about possible negative effects. I don't wanna mess with my life to the point of regret

Well, then you'd just fix it, surely. :-)

But perhaps the way to think of it is, that this is an acceleration of change. Rather than plodding across the existing landscape for a year to get to the mountain with your prize on it, the landscape compresses and you get there in a week. There may be a period of bumps (you're covering a year's terrain in 7 days) but to say that not taking control is more risky than making an actual decision isn't very convincing?

You'll always have regrets. If they are certain, better to get to them sooner rather than later. If they are not certain, than making conscious decisions is the way to avoid them. (Anyway: I think most people report regretting what they didn't do rather than what they did do.)

Q: Interesting way to look at it. Can you think of any specific examples of regrets people have had afterward?

I meant regrets in life, rather than as a result of doing the exercise!

There will always be "collateral shifts", because if you want things to change then, well, things have to change. Unfortunately (but also marvellously) you can't know the shape of the landscape until you encounter it - and you are the only knower. All of this stuff applies anyway to your life, it's just that when you start investigating things such as this, you become properly conscious of them - the mystery aspect, and that every intention moves the whole world. But at least when you intend deliberately, you choose. Right now, you're walking across a landscape that you made accidentally and clumsily.

Q: Ah that clears it up a bit, thanks! I think I'll try it and post my results as I notice them

Great! There's really nothing to worry about. And with a tool at your disposal which can help you and others, life can only get better surely.

Q: Well, I just did it, so I guess we'll see what happens!

We shall indeed! So, yeah: follow the last instruction (carry on with your life; results come to you, so there's nothing to be done) and give it a while to settle out

nothing (well not nothing) ... not much has changed

What does that mean, more precisely?

Q: My financial life hasn't changed the way i directed for it too be, intentionally, visually. Maybe i need to continue creating, sometimes i just feel like giving up since i don't see the occurrences changing, but then again whats the point of giving up if theres nothing to lose.

Suggestion: maybe initially go for something tangible, a specific thing or situation, rather than something as abstract as money?

Q: I think i just realized why i've been down lately and stressing. I've been caring "too much". I've been caring of how my mom feels about not wanting to work anymore, wanting to be retired as i wanted that for her but now i'll imagine the situation of her being happy, stress free, she is relaxing now that she doesn't have to work anymore and all her bills are being paid. May i create this? Of course it seems like i'm creating it for her but in a way its a reflection of me as well and i am creating this situation for myself. Too me money isn't much, my mindset towards it is invalid and only factual towards it being essentials towards material possessions/bills. Its not the money i want but the security the comes with it. Can you give an example of what you personally have created that is something tangible/specific situation and/or just anything in general even if it is not your experience

I think that no matter what your approach to getting something, you need to conceive of it as a lived situation from your own subjective perspective. Whatever you seem to want, what you actually want is one or more experiences, whether that's an audio-visual experience which implies a desirable fact, or an ongoing experience of a feeling which implies you are in a particular state. So, it is important when setting targets (everyday goals or more esoteric things) to frame them positively: in the sense that they are formulated as an actual thing you could live as a moment as a moving-towards, rather than an abstract concept or a pushing-away from something. (See links in edits 3 & 4 perhaps.)

Q:I have two questions: Will this work if I want to make someone else's situation better? How often can one do this?

So, the way to think of this is that you are selecting subjective experiences for yourself. And this of course means that you can select experiences of other people changing and getting better. Typically, I'd allow some settling out time after each use of the exercise; couple of weeks maybe. The original idea of the exercise was as a demonstration to show that there is "something going on", with minimal effort, so it's a kind of "fire and forget" approach. It just so happens that it's a handy tool also.

Q: Is there a part two?

In the pipeline, but since it'll discuss some of the related ideas, and it's better to just do the exercise without overthinking of it, I've held back from doing it for a while. Although I've discussed most of it in conversations already.

Q: When you say, 'choose a specific situation...', how specific is specific enough? What I mean is, I tried this because I'm going through a period where I feel really down-in-the-dumps and almost like nothing ever goes quite right in life, so I chose the words misfortune and good fortune. Is this too vague, or will it still have an effect?

It says that because the idea is that this is a "demonstration" exercise, and so if the situation is fairly specific, it's easier to decide whether there was a result (to show "there's something going on"). There's no actual restriction on what you can choose, though.

Q: Hey. For a few years now I hated how different I was from everyone, just weird. So just now I did this exercise. I wrote weird on one cup and normal on the other. I hope everything really works.

Maybe they'll all suddenly realise that they were the weird ones all along. ;-)

Q: Haha I hope

Seriously, though:

Don't worry too much about being "weird", especially if you're still at school or starting out in life, because later you'll look back on those "normal" people as being the boring people, and you'll discover more interesting people who overlap with you more. If there's something I'd recommend, it's learning how to be calm and relaxed, to be able to step back a little from things as they are happening, which will let you be more yourself. When people judge themselves as being "weird", sometimes what they really mean is that they're nervous and this causes them to behave a little hysterically in response to social situations - because they are not trusting or allowing their spontaneous selves to flow. (I don't know whether that is your situation; it just occurred to me to offer a viewpoint just in case.)

Q: So I did this exercise 2 days ago, is this similar to casting a sigil? I use to try casting sigils a few months ago and none of them worked :(

Only in the sense that it attaches meaning to sensory objects, but of course there's a commonality to all these sorts of things. If sigils didn't work, can I ask: did you play with the situation mentally at all after you had cast the sigil?

Q: I did play with them mentally in a way. I was very open minded for how the things would come about happening, and I could see possible routes for the things occurring everywhere, but none of them really came about.

Really, you should leave them alone. Once you've done the act, simply get on with your life knowing that the work is done and it'll show up. You should think of your thoughts as literally pulling and pushing on the world. And unfortunately, if you start pulling up that "part" and thinking about different routes and even having doubts, you are potentially reshaping that part accordingly. That's like having spontaneously created a schedule by intention (albeit one you can't see) and then keeping changing your mind on what you want and how you want it, so that the schedule keeps revising itself.

Q: Yea, I think it's very possible that whatever I was thinking about at the time could have interfered with it happening, however I never really did much obsessing over any of them, but I was pretty curious of how they would play out. Weirdly enough, one of them was to be given a bit of cash, (I can't remember how much it was, I think it was like a specific amount like \$30) but it didn't happen for like a month so I completely forgot about it. I also don't think about the others anymore haha, so it would be nice if they came about happening

Heh, well you know I'm just theorising of course without knowing the actual situation there. One problem is that every intentional act is a world-changing magical act. Lots of people are actually just spontaneous in their daily life, they don't "interfere" with it much (don't even know they could), and so the occasional intervention takes effect and then doesn't get undone. Meanwhile, others - ironically, often those who are interested in the topic and pursuing it deliberately - are constantly unwittingly "redirecting" themselves, wrestling with their world. So they fire of a sigil or whatever, but don't realise they are effectively doing constant "re-sigilising" through their world-focused thinking process. Which is why I think it's a benefit to everyone to practice a daily releasing exercise, and then "stop generating". Learning how to, say, stand up from a chair without doing anything. It teaches you how to intend a state-change only when desired.

Q: Yup, the second one could be me :P
I've gotten pretty into this stuff over the last few months, (actually learned a lot from stuff you have contributed) so I could be getting in my own way unknowingly, but I'm always willing to keep trying stuff because this whole thing going on is fascinating to me.
I'm eager to see that follow up post on this experiment! I'm curious about more of how this experiment works.

Yeah, it can be difficult because you want to do something to make things happen - feel some sort of mental or physical effort going on. But that's just the intentional generation of the experience of effort; it has nothing to do with making the desired changes!

Hopefully I'll have time this weekend to sit down at a desk and bash out the second part. The idea is that it will link the experiment (which amounts to ritual really) to the larger view of patterns and meaning and metaphor and so on.

Q: I assume meditation counts as a releasing exercise right? (I do mindfulness meditation sometimes where I just focus on my breath and watch my thoughts without trying), so maybe I should try to make that a daily thing, but it's hard cuz I think I'm addicted to stimulation haha.

Well, meditation can be good, but really I'd practice this: lie down on the floor in the constructive rest position (knees up, feet flat, books supporting the head) and play dead. Let go of controlling your body, your mind but most importantly: your attention. Let them shift and move and unwind as they want. Whenever you find yourself holding onto your focus again, cease to do so. In other words: "stop generating" and allow the pattern of experience to flow as it wants.

Q: Interesting, alright. Any reason why that particular position?

It corresponds to an ideal balanced posture - no residual muscular effort required to maintain it, fully supported. It's pretty much the only way to have your neck muscles release. (And it has to be the floor really, or a very sturdy mat, definitely not a bed.)

You'll feel it when you do it. There's initial discomfort because you are residually "holding yourself in the air" but when that settles out it can be super-relaxing. (10 minutes, twice a day, or whenever you are stressed.)

Q: So far, I haven't seen results with this method but it has only been about a week. I'm not saying that this method doesn't work, it could be something I'm doing wrong. I purposely made my "replacement situations" VERY ambitious. Example...I've been working out for years but desire to be a bit more muscular, so that was one thing I asked for. It's funny because if anything, I seem LESS muscular. I'd also like to mention that it's likely I still have resistance to change. I'm basically at the point where I know something is up but can't control my "dream" yet. Literally almost everyone I know has changed since "jumping", heck even a squirrel fell out of a tree after my friend specifically said it would never happen, lmao. But I still don't feel that I have the ability to "just decide" yet.

Ah, it's interesting what people choose as the situation!

So, ambitious is fine, although because this particular experiment doesn't force anything, your result will happen by "plausible if unlikely" routes. In other words, there will arise "apparently reasonable excuses" for what you to get what you want. Anyway, this is an interesting one to watch happen. Yeah, the "something is up" period is fascinating. There's still the urge to try and make things happen by somehow doing them; like you can use your muscular tension or effortful frown to assist you. You know something is going on but it's still not clear how, exactly. There may be a squirrel or two to go...

Q: Haha yes, the muscular one will be interesting to see happen. However, my pouring into the "Billionaire" cup will be even more interesting to watch unfold ;) Especially because I'm a programmer who makes apps, which makes it completely within the realm of possibility that it happens. I have a theoretical situation for you. Say a regular, ordinary person with 0 knowledge of oneirosophy/DJ/insert-metaphor finds your post and performs this experiment. Are you confident that they will achieve their replacement situation? Or is it required for one to know at least "something is up" before getting results?

Theoretical Situation

They get the best results! Everyone else who thinks they have some knowledge of "how it all works" subtly tries to manipulate themselves, or help it along, or work out what's really happening. This is one of the reasons I came up with that particular formulation: it's not so easy to make sense of it, even if you have thought about this stuff before, unless you've been pondering raw pattern/meaning activation. Of course, once you know the underlying, you can go directly for it, but it requires a level of bloody-mindedness. Just as you can't "sorta, maybe" lift your arm, you have to follow through and not re-edit the world before it happens, so it is with this. You are interacting with the world directly.

The Billionaire's Cup; [1]

Hmm. Being into programming and creative stuff is good, just in terms of allowing things to happen, because opportunities can come from nowhere and still be plausible. Most people find that easier than getting that inheritance from a long lost uncle or whatever. Even though, of course, everyone has a potential long lost uncle; they've just not called him into experience yet...

[1] Choose wisely.

Q: Thanks for the insightful post. I've seen you mention multiple times that one reason for "detach-and-wait" methods failing is by accidentally modifying the world back to it's original state. Let's say one is screwing about and this phenomenon occurs. Does one re-perform the experiment and wait or simply place their faith back into the original experiment? I would guess that the latter would be enough to work, since it is the intention that matters right?

You simply need to do something which means-that you have returned (are returning) your world-pattern to the desired state. You can reperform the experiment, or perhaps mentally recall the final state of the experiment and the feeling you had, or just superimpose "RELOAD" over the scene before you with the intention that you are loading up the state again. But this is only a problem if, after realising what you've been doing, you think-that you've undone it.

The whole "faith" thing is about realising that since changes are direct and immediate, creation is "already done" at that moment. It's definitely best you can commit and so stop tinkering; the exercise in the post is meant to avoid that crossing your mind (because you probably don't have access to the pattern anyway).

Q: I understand that changes are "direct and immediate", but what is the amount of time taken to see changes indicative of? Have you found through your trials that a persons level of "resistance" can make experiments such as this one take longer for the patterns to become noticeable? As in, could it possibly take decades? I guess what I am asking in simpler terms is that theoretically if TriumphantGeorge himself were to perform this exact experiment and ask for something non-trivial (money, fame, power), does it reveal itself near immediately? This is something that I've been struggling to understand lately. If the time taken to see changes is relatively unpredictable for even well-versed folks such as yourself, this method would seem much less powerful in comparison to the immediate "asserting" methods.

this method would seem much less powerful in comparison to the immediate "asserting" methods.

Completely right!

The origin of this exercise is purely to get people to witness a result with zero effort or interest at all; you don't need to commit to "jumping" or any other metaphor. Although the pattern of change is implemented immediately here as always, it is overlaid upon whatever other patterns have already been accumulated, so you will see it only when the context allows it to "shine through", as it were. You aren't gripping the world in the same way as you do with other methods. Where its advantage lies (apart from not needing any practice at all) is that having done this, you gain direct knowledge of how your entire experience and every intentional act you perform works the same way. You realise there is no technique. It's simply a matter of how specific and strong the intention - and not re-intending subsequently. If by simply pouring some water while simultaneously summoning the pattern of a state you can bring it about, it makes you realise: a) how powerful you are specifically and, b) how cautious you should be generally.

Personally, I would not think in terms of "dimensions" except as a powerful metaphor - as in, if your experience shifts dramatically it is equivalent to being in a different "dimension". You will never have any experience outside of "your reality", so any change that happens is basically a modification of that. This particular exercise should be thought of as a way to change a situation in your life without having to get bogged down in any theory!

Q: Is it possible to have effects that result in other people leaving your life? Or is this exercise limited to purely personal situations where controlling where the people in your life go is out of bounds? The reason I'm asking is I'm hoping to do this to have my in-laws want to leave our house and go back to their home country.

There are no restrictions here, only choices. For the purposes of this, think of yourself as having your own "private view" of the world. You can have any experience you want in your private view, since it's your "personal slice" of the infinite gloop. Nobody can stop it. Anything can happen. Go for it.

Q: Will the water spilling have an effect on the result? The glass that I was using to pour the water spilled a bit when I was pouring into the other glass. The rim is round with no spout so the water just kind of ran down the glass and dripped off the base. Not a lot of water, but it wasn't a little either. Should I try again using a more square glass?

If you feel you've left yourself with doubt - if you don't feel satisfied - then you can repeat it, just so that you can comfortably feel that you completed it, and move on.

Q: Okay, thanks! I'll try again because I feel like I didn't do it right.

Yep, good stuff. As it says in the instructions, you want to be able to allow yourself to take a breath and feel relieved at the end - and then you can just move on (because you've already made the change).

so I wrote a phrase

That's fine. I say "word" in the instructions to prevent people writing extended descriptions, rather than calling up the essence of it. The effort to encapsulate it helps, since it corresponds to identifying and accessing it. Things tend to happen pretty quick (in fact, the underlying change to the world occurs upon completion of the exercise). How soon you encounter the evidence of that obviously depends on the particular situation. Look forward to hearing your results once they're in.

Q: Thanks for the clarification! On a related note, if I wanted to do the exercise again, is it better to wait until the results from the first one are "settled"?

For this, I'd tend to do one thing at a time, but there's no restriction really.

Q: Can we write a specific delivery date under the label of the desired situation? ...or the ripples in the ocean of patterns are too chaotic for such a level of precision?

There are probably better ways if you want to be more targeted (this demonstration exercise is deliberate in its stripped-down elements) but the process itself doesn't limit you in this.

Q: What sorts of better ways might there be for more targeted pattern activation?

There are links in the intro post so check there, but it's pretty much summarised in its raw form in this post: The Patterning of Experience.

Q: I have a family member who drinks too much and its negatively affecting my desire to be around him. Is this act applicable to such a situation? What is the implication of another's free will here?

Yes, that is a suitable situation. The free will discussion is somewhat tangled, but trust me that you don't need to worry about. It all works out. As an easy way to think about things: consider this to be "your copy of the world". Wouldn't you want to make it the best world it can be, with everyone in it becoming the best version of what they can be? Any action which supports that outcome is a morally good one, and your intention sounds like it fits in nicely. So maybe think of the "end situation" as being one where the family member is sober and also much happier as a result. That way everyone benefits.

You could drink it if it feels right to do so, symbolically. Since, part of the point of this is to prove there's "something going on", I'd take on particular situation and let it play out completely, until you know it is done. (Thing take a while to settle.) Then armed with the knowledge you've gained, you can choose how you manage it from then on.

Q: Just a quick question, sorry if it has already been asked. I'm thinking about trying this, but haven't done it yet. I can think of a few different things in my life that I would really like to change. Is it ok to do this multiple times within a short period, for different situations? Thanks.

Since part of this is to prove to yourself that "something is going on", I would choose one situation, do it, let the results come in, let the world settle out again. After all, what's the hurry? If it wasn't for this post you wouldn't even have the option. And why would you start stirring your reality around with a technique you hadn't properly investigated yet? You get the idea. (This is fun stuff, but it should also be taken very seriously.)

Yep, so, pick one situation first and follow it through!

OVERVIEW OF METHODS

In essence, all of these describe the same technique: detaching from the current sensory pattern, allowing a formatting shift, and triggering a replacement (either by deliberate intending or by accidental alignment via mood association).

- The mirror technique that began this subreddit (described below), which follows a traditional approach to detaching one's attentional focus to permit a formatting shift.
- Neville Goddard's approach as described in books such as The Law and the Promise, which itself is based on ideas about the serial universe popularised by the likes of E Douglas Fawcett and JW Dunne.
- Overwriting, Deciding and Patterning for extended pattern triggering and autocompletion.
- Memory-block exploration via Infinite Grid and Hall of Records metaphor structuring.
- Ebony Apu and the Hawk and Jackal system of Multidimensional Magick.
- Direct creation of synchronicity (basically another version of the patterning approach). See Kirby Suprise's book, Synchronicity, and this related interview.

The key to doing things knowingly is to change your perspective philosophically; but understanding is not required for producing an effect. You may also find the concept of "persistent realms" to be useful.

The mirror technique

This is the original mirror-gazing method by /u/Korrin85 which kicked off the subreddit:

- First things first, you're going to need a mirror. The bigger the mirror the better. If you could theoretically walk through it all the better. It helps out a lot.
- Best times to do this are at night. Most success happens at around 12-3, although you can still do it in the day time. Just harder.
- Turn off all the lights, get rid of as much noise as possible, and sit facing the mirror. Have a candle between the mirror and you. Everything else around you should be dark.
- Relax, clear your mind. Concentrate on your reflection. View your reflection as another YOU. A YOU from a different place. Call out to that YOU, whether it is out loud or in your head. Concentrate on switching places with that YOU.
- It takes awhile, and some get it faster than others, but if you "shifted" from your current universe, you should feel something. Some of the signs for small shifts have been a brief feeling of movement, a moment of disorientation, or even your reflection blinking at you when you didn't blink. Bigger shifts include your reflection moving on it's own or even the feeling of you literally moving into the side. The bigger the shift, the more you feel.
- If you feel any signs, STOP! Take a few days to note any changes. They can be small, like a scar on someone that has mysteriously disappeared or something being a different color. The more you shift, the bigger the differences you see.
- Optional, but it works better if you have a "destination" in mind. For example, you can focus on you switching places with the YOU that has more money, or slightly better off in general.

Also check out Korrin's expanded guide which included answers to a few common questions.
[https://old.reddit.com/r/DimensionalJumping/comments/2ax00o/dimensional_jumping_for_dummies_revamped/]

The Imagination of Neville Goddard

One of the most eloquent promoters of the New Thought view that imagination affects experience was Neville Goddard. Although not strictly 'dimensional jumping', his ideas are one way that we can envisage "what fills the gap" - how new experiences are seeded in the gaps between moments. Candles and mirrors and detached states are all very well, but the resultant shifts are a plunge into the unknown if you aren't clear about what dictates their direction.

This may sound familiar:

Self-abandonment! That is the secret. You must abandon yourself mentally to your wish fulfilled in your love for that state, and in doing, live in the new state and no more in the old state. You can't commit yourself to what you do not love, so the secret of self-commission is faith - plus love. Faith is believing what is unbelievable. Commit yourself to the feeling of the wish fulfilled, in faith that this act of self-commission will become a reality. And it must become a reality because imagining creates reality.
-- The Law and the Promise, Neville Goddard

The world is imagination! Notice the mention of "feeling" as being fundamental to his technique (described elsewhere in the book). This is also emphasised in his The Power of Awareness, which is probably the better book. Both are interesting reading though, if you can put aside some dated wording and the biblical references. Goddard viewed the Bible as a metaphorical guide to the true nature of reality, with 'God' and 'Jesus' and 'the son and the father' representing the process of creation and the relationship between imagination and the world as experienced.

- EDIT1: All of Neville Goddard's books and lectures are out of copyright as far as I know and can be found free online in various formats. The opening sequence of Out of this World is particularly recommended for this subreddit for his quick-n-dirty overview of 4D thinking and manipulation; it'll mop up a few recent questions I reckon. And for the super-keen metaphor enthusiast, there's An Experiment With Time and The Serial Universe by JW Dunne (see overview).
- EDIT2: A better resource with all of Neville's lectures, books and audio can be found here.
- EDIT3: For a quick theory-free summary of Neville's approach: Imagination Creates Reality and Awakened Imagination.
- EDIT4: Also The Pruning Shears of Revision captures the essence nicely, and the description of Eden sounds a bit like an Imagination Room.

Overwriting Yourself

Overwriting Yourself

It is fun to contemplate reality from the perspective of idealism and subjectivity, and talk of consciousness as an undivided whole. Imagining the world as a dream-like experience which might be subject to one's will can trigger in us all sorts of exciting possibilities. However, it's one thing to dream about a dream in this way; it's quite another to knowingly dream the dream itself. Is it even truly possible, or is it just a fun and comforting idea?

How can we get there when our everyday experience doesn't quite correspond to this ideal? One approach is to attempt to directly alter our experience to conform to it.

The Experiential Dream-Space

If it is true at all that reality is dream-like then it must be true right now. In the room you are apparently in, at this very moment. So look around. Furthermore, your own body and thoughts must themselves be dreamed, along with every other experience you are having. All of this must be arising within an open "dream space" made of mind, of awareness. All of this experience is "you"! It doesn't usually feel that way though, does it? Why not?

Even if we understand intellectually that everything is consciousness and the world is undivided, we still usually feel that there is an inner and an outer to experience, that we are "located" and separate, except during certain peak experiences. What is the nature of this feeling? Can we tackle it directly? I say we can.

Stuck Thoughts, Incomplete Movements

I suggest this disconnect arises because over time we accumulate forms of "experiential debris" in our dream-space. The ideas we accept, the thoughts we have, the other encounters in the world whether passive or active - all leave traces which, when repeated and reactivated, gradually solidify. There are many implications of this, but the important ones at the moment are:

- Stuck Thoughts. These are basically thought structures that have solidified in your space rather than naturally dissolve. These may be located in your body area or beyond. This sense of division between body and world is one such thought.
- Incomplete Movements. These are intentions which were resisted or aborted before they followed through to completion. This might be a suppressed startle response, a decision to do something which you then halted by tension or a reverse intention, and so on.

Neither of these would arise or be a problem if we lived in open non-resistance. However, most of us are holding on to - identifying with - certain patterns in awareness, and this prevents the natural passing and dissolving of these structures. This leads to a sense of clutter and constraint (stuck thoughts) and tension (incomplete movements).

Subtle Identity, Subtle Boundary

Although all held structures interfere with our direct appreciation of the dream-like experience, there are two particular ones which being subtle are often overlooked:

- The first is the Subtle Identity. This is a sense of location, usually somewhere along the centre line of the body. It is a "stuck thought" which consists only of a felt-sense. It is where you feel "me" to be, even as you obviously experience it from outside - i.e. "me" is experiencing "it".
- The second is the Subtle Boundary. This often corresponds to what is perceived as one's "personal space". As with the identity, it is a subtle felt-sense, a three-dimensional structure felt as a subtle "wall" between one area of the dream-space and the rest. Again, it consists only of a located feeling.

The key to directly experiencing the undivided nature of your world is to at least recognise, and ideally dissolve, these two structures.

Releasing Held Structures

There are three general approaches to releasing these structures, ranging from passive to fully active:

- **Passive.** Simply lie on the floor each day for about 10 minutes. Completely let go to gravity, and allow your body and thoughts to move as they will. If you find your attention narrowed on some aspect of experience, simply let go of holding your attention. Let it roam as it will. Gradually, over quite a long period, your held patterns will unravel naturally. However, you will feel benefits of increased clarity almost immediately, as the most shallow structures evaporate rapidly.
- **Investigative.** In this approach, you actively sense out difficult areas and release them. Sometimes we know there is a particular problem that needs tackled, other times we might scan our bodies or larger space and seek them out. Either way, we approach this task with an open, relaxed attention. Having identified a particular stuck area, we "sit with it" and let it intensify and release into the background of its own accord.
- **Active-Assertive.** The more extreme version is to go straight for the desired result. Residual structures are accumulated over time, a deformation of the nature open, empty experience that we began with. Instead of gradually diffusing these structures, we can instead wilfully assert open space as our experience. To do this, we allow our attention to open out and be unbounded: expand into the whole body space, the room, and beyond. We take our stand as the background space in which patterns appear. We then simply assert - declare to ourselves as fact, summon the feeling of it being true - that we are experiencing complete open, structureless space. You will immediately feel the contrary to this: it is not yet true and so you will be very aware of the elements of experience which are not open and empty. Reality will offer its counter-assertion! Regardless, you simply stay with this posture of assertion and sit with it. Gradually, the resistance will soften. With regular practice, you will rapidly approach a clearer more, open experience - the subtle identity and boundary will become particularly obvious to you, and soften subsequently. However, a sense of expanded space and looser division will be almost immediate. Important: You are asserting the feeling of truth of this directly into the dream-space here, rather than merely thinking-about it.

Note that with the final approach, you are effectively overwriting yourself with empty space. As such, it is natural that you will encounter quite strong resistance and even a sense of existential fear. For this reason, it is probably better to start with one of the other methods, build up to this, and begin with only "light assertion" until you become acclimatised to the experience. Afterword - This process is closely related to the interrelationship of arising experience, creativity and memory formation. See /u/ava_santana's post on a feedback model of experience and my comment here. Intend to do more on that and its connection to magick and "pattern transformation" later.

...

What sort of exciting possibilities has this unlocked for you?

Puppeteer of the dream-space.

...

EDIT: Okay, you've bought up a great topic, so inevitably I just couldn't stop typing once I got started! :-) But it's useful to get some of these related points down in one place I think.

Stuck in your Head

After lying still for a while, I felt like I was 'stuck' in my head.

That's usually the first impression people seem to get, and it can be surprising. People meditate, work on letting their thoughts pass and so on, get some success - all the while not realising they have circumscribed their world into this little area. It doesn't really give any 'content' much room to arise and dissolve - no wonder people find themselves so "thinky". They are effectively "clenching their being" constantly. And tense, unmoving patterns spew out thoughts, no matter where they are in the body-space. Another side-effect is that they are living their lives in "blind-sight". You are not truly out there in the world, you are only seeing it through a peripheral view, actually experiencing your thoughts-about rather than your direct-sensing.

I have some history with the 'fourth way' of Gurdjieff/Ouspensky as well which is also related

Now, I've read a little of Gurdjieff, but never really pursued it. It was going to take a bit more dedication to it than I could muster at the time, although it seemed pretty fascinating (I was looking into the Alexander Technique at the time).

Attention is not a Torch

What I mean by this 'stuck' feeling is that 'all' of my consciousness was sort of balled up there. Do you have any suggestions for moving it around? To the bottom of my feet, for example, or the corner of the room?

I know exactly what you mean. To get clear - because your "consciousness" is actually always everywhere - let's call it "attention" for now. The problem you have is that your default "attentional profile", its extent in space, has become defaulted and constrained to a certain area. You can temporarily force it out, but it'll spring back for two reasons:

- You are trying to move it, when attention is not something that is to be moved - because it is not thing. The metaphor of the torch-light is incorrect, it is more like a 3-dimensional spatial filter, a "profile varying the intensity of experience across space".
- You have accumulated structure/habit in your world where your attentional profile always settles into that shape, that location, probably with a 'felt-sense' boundary. Basically, you've ended up with a little "valley" in this area of your world.

Okay, the three methods described in the post are pretty much for this. First of all, adopt this assumption: Your natural state is to be completely open, without even an attention boundary - no localisation. Following the passive approach regularly (in which you don't concentrate, simply let go), your tensions and division would eventually unfold by themselves, and your attention would become increasingly open. But this takes patience, and you have to do it every day, and you have to not mistreat yourself (by forcing and pushing) in between times, ideally. The secret to doing this more deliberately is: You do not move your attention to an area of experience, rather you expand it to include that experience in your area of attention. The area you include doesn't need to be adjacent - what you are effectively doing is "increasing the intensity of attention at that point" - but it's initially helpful if it is. So, next time you're lying down, discovering you are constrained into your head area, let it be. Then feel out the tips of your toes, and include them. Gradually, feel out your whole body, bit by bit, in this way. Then feel out the space around you body, and beyond. Remember, you are not really moving or expanding consciousness - that is already everywhere, what your experience is and is made of. You are basically including aspects of experience more fully in attention, and eventually dissolving the boundary of attention - the habitual valley - completely.

Switching Perspective

Now, this approach is focussed on the content. It is possible to short-cut this by switching perspective to the background space in and of which content arises. The exercise in the middle of this post tries to help with that. Also, Rupert Spira tries to lead someone to this in this interview. Once you know that you are really the whole space, you can just switch perspective to it. That doesn't mean all the debris disappears instantly, but it stops being troublesome, you are opened-out, and the debris will even be slightly loosening during daily activity while you are in this mode. The author Greg Goode has referred to this as Standing As Awareness, in the book of the same name. Another quick shortcut is to include in your attention an external sound, such as distant traffic. Sounds are more discrete than images, and so attending to a sound often draws you to, and releases you into, the silence surrounding it. Finally, including (not focussing, remember) the sensation of space just behind your forehead (where "your pre-frontal lobes would be"), can also help, since the thought-generation tends to occur nearer the back of your head-space. In general, then, we want to avoid deliberately narrowing our attention, and find ways to encourage and allow it to open up without force - since force tends to paradoxically fix the current pattern in place.

Further Reading

A martial artist called Peter Ralston has a nice phrase, "feeling-awareness", that he uses for this "sensing out" approach, and covers some nice exercises in his book. You might find it interesting. You might also be interested in the work of Les Fehmi on open/narrow focussed attention. And here is a nice illustration from a review of Marion Milner's book, A Life of One's Own, which captures it somewhat.

Somewhat unrelated, have you read 'The Great Book of Amber' by Zelzany?

No, not heard of it. Fancy giving me some highlights? I've been mostly re-reading old favourites from Philip K Dick, Haruki Murakami and JG Ballard lately to get me in the imaginative mood. (Latest: Eye in the Sky, a PKD I'd never even heard of, and quite relevant to the subjective idealist platform of this subreddit.)

wow, thanks for such a huge reply. I'll read into it and try tonight.

I had lots of bits of ideas I kept meaning to post about but haven't, so figured I might as well make a comment out of them!

Amber... 'shadow-walk'

Right, that sound interesting. I'm usually more sci-fi than fantasy, but I like anything with clever 'reality' ideas. In fact, that sounds a little bit familiar - someone might have recommended these to me before. Thanks!

quick update - i did what you suggested, and i had a feeling of 'largeness' - i'm not sure how else to describe it. like i was a big ship in the ocean instead of me in my bed. very interesting. thanks

There you go! Great. :-)

Imagine having that as a part of your daily experience. It's pretty hard to build up tension and fear and resistance, while also being so 'open'.

TriumphantGeorge Compendium - Part 2

Just Decide.

Lie down on the floor, in the constructive rest position (feet flat, knees bent, head supported by books) or the recovery position (on your side, upper arm forward) and let go to gravity; just play dead. Let your thoughts and body alone, let them do what they will. Stay like this for 10 minutes. If you find yourself caught up in a thought of a body sensation, just let it go again. After the 10 minutes, **you are going to get up. Without doing it.** Just lie there and "decide" to get up. Then wait. Leave your muscles alone. Wait until your body moves by itself. This may take a few sessions before you get a result, perhaps many, but at some point your body will just get up by itself. Once that happens, avoid interfering with your muscles and let your body go where it will, spontaneously and without your intervention. This is how magick works. All you need to do is, decide. As Alan Chapman says, "the meaning of an act is what you decide it means". But you don't even need an act. You can just decide an outcome, a desired event, to insert a new fact into your world, without a ritual. Just decide what's going to happen. **Just decide.** Decide to be totally relaxed. Decide to feel calm. Decide to win at the game. Decide to meet that person you've dreamed of. Decide to be rich. **Decide to triumph.**

Because in this subjective idealistic reality, where the dream is you, what else is there to do?

EDIT: When doing the part of the exercise where you get up, you may find it helpful to centre your attention on the area just behind your forehead. This keeps "you" away from your body, and any attempt to "make" it happen. See Missy Vineyard's book How You Stand, How You Move, How You Live for similar approaches, without the discussion of the larger implications.

EDIT EDIT: Do report back your experiences if you try this.

...

Q: Oh, I just remembered something. Long time ago I've heard of a similar exercise. In it you're supposed to stand upright and relax, and then as you say "decide" that your arms will begin raising, but don't actively raise your arms. At some point they should start lifting up as if on their own. I am pretty sure this exercise is related to hypnosis. I've heard it looooong time ago, almost like in a different lifetime.

Hypnosis is pretty much 'decision and allowing, or acceptance of direction, without muscular action'. You are actually doing hypnosis on yourself all the time, but you accompany it with excess muscular tension, to feel that "you" are doing it. I recommend Daniel Wegner's The Illusion of Conscious Will for those interested in more on this.

Will is not an illusion. It's crazy that you slip back into that again after you agreed that it isn't an illusion. Very irritating.

Erm, that's just the title of the book. The book is pointing out that people attribute their actions to themselves after the fact - e.g. the hypnosis thing - when it wasn't "them" that was doing it. However, the book's notion of "themselves" is in correct (it corresponds to the ego thought), and so although it is well written and full of good information, its final analysis is off base (it almost gets it right, then saps out in the last chapter!). My recommendation of the book is that it highlights that we associated "doing" with muscular tension and other false signals; in fact "we" are doing everything, and the notion of Will as commonly understood is incorrect.

Q: The book is pointing out that people attribute their actions to themselves after the fact - e.g. the hypnosis thing - when it wasn't "them" that was doing it. This is complete nonsense. It's always you that's doing everything. It can't be any other way. However, it's not George that's doing it, but you were never George to begin with, see? You are just you! You are that which is open to all options, one of which is George-ing around and humaning around. That's one option of an infinity for you. But it is you. The you that's real, and yet beyond optional identities in fact "we" are doing everything Not "we". Just you. It's not a democracy.

I'll just draw your attention to the phrasing I deliberately used: "People who are interested in this might like this book..."

It's a good read on the topic for those interested. All the rest of what you say, we've already covered and agreed on I think. I'll say this: That having an experience like the one I describe has more influence than any amount of thinking and philosophising or even accepting of a worldview. You can see it in people: Their body moves by itself, and suddenly causality doesn't work how they thought it did. It's suddenly easier to make the connection between how a person can change the world directly - it's "all you" and responsive.

Bah! The more you read around these things, as a person, the more you are able to deconstruct the assumptions you have been made. In my experience, all-or-nothing jumps to an alternative worldview just cannot be communicated to others. Now, that which is behind the person - Shiva! I see Him behind your eyes! - is always listening. Often you can talk to both at once, and one message and another message are received and acted upon in different ways.

I've had experiences words cannot describe, including uncreation and recreation of the known universe. However, I only had them because on some level I could conceive of them and knew how to open my heart to them.

Yes. Also, sometimes experiences lead to the ability to conceive of things that one couldn't previously. That's why there needs to be doing as well as thinking, in a manner of speaking.

That's rare. In fact, I can't think of a single time.

Really? So, you've spent your life assuming, say, that being in the world involves physical effort and trying. Someone demonstrates to you that this is not the case, that things can 'just happen' in line with your wishes. Are you saying that wouldn't result in a change of how you conceive the world and yourself?

(Yeah, I know, you're already there; but you see my point.)

Q: So, you've spent your life assuming, say, that being in the world involves physical effort and trying. Someone demonstrates to you that this is not the case, that things can 'just happen' in line with your wishes. Are you saying that wouldn't result in a change of how you conceive the world and yourself? How would someone demonstrate this to me when my prior commitment is not compatible with the demonstration?

In what sense?

Q: Well, suppose I am committed to the idea that I accomplish things by going up against external resistance. Now how would you demonstrate to me that "things can just happen?" (what the hell does that even mean? it sounds fatalistic)

If you are committed to that idea, **then enjoy the struggle.** I'd prefer to be committed to the idea that **it can all be effortless**, and that **all I need do is make the choice that what I want to happen will happen**, and it will.

Q: So I was right. Knowledge precedes experience, always. Contemplation is Lord.

Decision precedes experience. You don't need to deconstruct by contemplation.

And knowledge/understanding precedes decision.

It is not required. Only in the sense of it occurring to you that it is possible for 'such and such' to happen, that you would do the deciding, I suppose.

Q: You can't decide to florodimbare if you don't know what florodimbare is. You need understanding to decide.

I'm more of an interconfibulator, but there you go.

Q: You're just agreeing with me and conceding the point.

Nope, not really. To detail it out: You don't need to understand the details in order to get what you want, you just need to know what you want. That sorter of 'knowledge' doesn't seem very challenging, or much of a hurdle. Needing to understand in detail how the reality 'works' or its nature would be greater hurdle. This is optional though; all you need to do is have demonstrated to you that decision —> result, and then accept this.

You still need some understanding of what you want.

You need to be able to specify the experience you want to have. That is not a very big leap to have to make.

Your mind is like a peanut in size. That's why I keep surprising you with my posts, like that one time with the tradeoffs.

Bah! My peanut is The Universal Peanut, encompassing all within its husk!

Of course, there is no 'how reality works', except for the patterns enfolded within experience. However, some of these are from [apparent] birth, so it takes a bit longer to dissolve them. While relaxing on your yacht. Eating steak.

Precisely. And you need to believe that such an experience is not just a fancy, but is one potential reality. This is impossible without contemplation if your starting point is one of an ordinary, untrained, conventional human being.

Really, not. The decision is enough, and getting out of the way. You can learn this 'gesture' by practicing the exercise, and you're off.

This is true for everyone at the ultimate level. When I said your mind is a peanut, I meant the capacity you're exercising right now, your ready capacity. I wasn't talking about your ultimate capacity. Ultimately you are Almighty, of course.

Uh-huh. So, you're wielding that Big Universe Power right now, are you? While eating jello sandwiches for dinner accompanied with a mug of water?

You're confirming a pattern and conforming to it. Not dissolving it.

Pattern confirmation is different to pattern leveraging. Ignorant pattern-use is self-reinforcing; understanding that it's enfolded patterns does not do this. In the same way as Dream Yoga leads to karma-free actions just through awareness.

I disagree. You can get started in the way you describe, but getting started will lead you toward the path of contemplation.

The knowledge required isn't very great though, is it? Just "this is a dream" is sufficient. Just decide to switch your perspective to containing space, and you're pretty much there. To stand as awareness. When you become the context rather than the context, you're free.

No. I have a bag of peanuts compared to your one peanut.

But... they're in a bag, all constrained and trapped. It's probably not even a transparent bag.

You can't leverage something that's been dissolved.

Dissolving just means something stops being mandatory. You can use any route or pattern you want. Or not. However, just recognising the existence of a pattern means you can skip it; you can leverage that pattern through choice, or not use it. Recognition of the arbitrariness of a pattern - that it is not actually a shape of the world - is sufficient. It's about giving yourself choices. You don't actually need to dissolve everything to nothing to give yourself that power.

Nonsense. Karma means intent, and Dream Yoga leads to mastery of intent instead of its absence.

Karma means accidental creation of non-transitory patterns through intentions/actions that aren't 'transparent'. Leave no trace.

The knowledge required to get started, to make the first step on a long journey, that's not very great.

The rest is just... patterns. I reckon 2-5 years to dissolve most of the back-up though. But you can still have yachts and steaks while you're doing this. (Actually, that's not strictly true, because everything can get quite unstable during the process.)

Hahaha... oh my. This isn't a knowledge for you yet, is it? . . . In other words, you should be able to put your body and social reputation at risk, or you're not serious. To lean on this knowledge means you can't lean on any competing form of knowledge and still be sure-footed.

I already did. That's why I am where I am now. You're right, in a way, about going "all in" to an approach - the bold step forward. But you can have daily reality-shifts for that, if you don't want to have to completely destabilise all the time. Thing is, I quite like having fun too, y'know?

"Dissolving just means something stops being mandatory." OK, so build something in the sky then. Having yachts is not that!!

Y'mean, like, a personal jet? :-)

That's not what karma means.

That's what not accumulating any karma means. Pattern accumulation, with a corresponding funneling/backlash effect. Feel free to return with your counter!

Q: I reckon 2-5 years to dissolve most of the back-up though.

You are utterly delirious. I can only laugh at this nonsense.

Thing is, I quite like having fun too, y'know?

You can't imagine having fun without a yacht.

Y'mean, like, a personal jet? :-)

No, not like that. Build something that never lands and something you can walk into through any door.

That's what not accumulating any karma means. Pattern accumulation, with a corresponding funneling/backlash effect. Feel free to return with your counter!

So freedom from patterns is a recognizable characteristic in this case. That's a pattern in its own right. A higher level pattern.

Why not? It took me 2 years to do the opposite, and I know what I did. In the space of 2 months I've deleted most of those mental objects. What's your problem with that timescale?

Not that I'll be flying under my own steam quite yet by then. I'll be in a steam-powered airplane though.

You can't imagine having fun without a yacht.

Yes, the yacht is required. Sorry. I must have been a sailor in a previous life. Or a jealous coastguard.

I look at the ideas you bandy around, how you slip into convention and fatalism.

I adhere to the most open view that it's possible to have. I'm just honest about my experiences. I work on the assumption of no-structure, but I also recognise there is apparent structure. I wouldn't want to zero that out over a shorter timescale. I don't want to delete things down to an empty space, actually.

You don't need a yacht to sail the ocean of your own mind.

But the yacht is on the ocean of my mind. In fact, it's the yacht of my mind, sailing the ocean of my mind. I don't see why you think that patterns of my mind (be they yacht-shaped, private-jet-shaped, or whatever) would somehow prevent other patterns taking shape or dissolving, as I see fit. They are non-causal; only I am causal, as the material of experience itself.

That isn't the point. The point is that the possibility of empty space without things shouldn't be a disturbing or frightening one for you. It should be a familiar and navigable space and not something you're running away from.

But that empty space - or rather, place - is already there, right now, in my experience. I can stretch out into it right now. It feels, frankly, very pleasant. You can't navigate it, because it comes before structured space. If I want to dissolve everything in it, of course I could just lie down and go to sleep at any time...

Oh no. The ocean that a yacht is on is like a spit in a thimble compared to the ocean of the mind.

Then I'm "gonna need a bigger boat"!

Q: *If I want to dissolve everything in it, of course I could just lie down and go to sleep at any time...*
Nope, that ain't it. Sleep doesn't affect the basic pattern. To wit, you still find yourself in a human body, doing human things, 99% of the time, right? Maybe for you, 100%. I don't know if you've ever dreamt yourself in a non-human body doing non-human things.

Yeah, I wasn't being serious actually. Just making the observation. Sure, I've often dreamt of being a 'perspective' or just being 'everything' or anything else. It's easily done, and one of the first fun things about lucid dreaming, once you've finished flying and having 'encounters' with pretty people. In terms of RL, I often just switch to the open space perspective now. No body, just an environment.

No, that ain't it. That's not what I had in mind. I was thinking of a more radical break with familiarity.

Such as? Changing the number of dimensions is fun, having more than one timeline simultaneously is interesting, experiencing multiple moments at once, all that. Feel free to offer suggestions!

What is the point of this?

Really? Switch to being the dream. Then insert facts directly into it.

Be a dragon and do dragon things. Have dragon's concerns, dragon's dreams. That's just a tiny example. Basically step away from humanity in some way.

Sure, that's all been done. Wolves, fish, clouds, just nothingness, all that.

So you're not a dream if you don't do this? Is that what you're saying?

You are always a dream, but sometimes you are dreaming of being a person. You need to dream of being a dream. You can 'inject facts' either way, but freed from human boundaries you have greater influence - or rather, it is more obvious how that influence can come about.

No you don't. It's the same dream with the difference being what you know about it.

Sure. That's just phrasing.

Aren't you confused?

I don't see the confusion. I enjoy both aspects of experience. It's being obligated to have one experience that I fight against. Delete your accumulated mental objects with empty space, then you're free to use whatever you like. It's fun having a human experience. Eventually this body will be dead and I'll be out of it anyway. There's no rush for that; it takes care of itself. In the meantime, it makes sense to maximise the power I have over this experience of course. As it is, I can spent 50% of my time in an alternate reality anyway, if I so choose.

It's fun having a human experience. For how long? Under what conditions?

Under the conditions I decide. :-)

"it takes care of itself" I strongly disagree.

Now, that is a decent point actually, for your everyday chap. But the point is not to be that, yeah?

Q: *Sure, that's all been done. Wolves, fish, clouds, just nothingness, all that.*
I don't buy it. I get a hunch you're speaking theoretically, as in, that's the principle of a thing. Not your remembered experience.

Well, what can I say? I've been lucid dreaming since I was a teenager, although I never really sussed it until my 20s, when I read about someone being two people at once in a dream and 'having fun with that', so I decided to recreate that for myself.

Q: *So have you had dreams where you're not in a world as we know it? A wolf is a denizen of our world.*

I have explored the universe! Isn't it one of the first things you did? Become a space probe and go exploring out into the solar system, check out the rings of Saturn? The experiences are slightly more OBE-like. This is what inspired me (I read Oliver Fox and Robert Munroe before I got to lucid dreams):

“You can move through space (and time) slowly or apparently somewhere beyond the speed of light. You can observe, participate in events, make willful decisions based upon what you perceive and do. You can move through physical matter such as walls, steel plates, concrete, earth, oceans, air, even atomic radiation without effort or effect. You can go into an adjoining room without bothering to open the door. You can visit a friend three thousand miles away. You can explore the moon, the solar system, and the galaxy if these interest you. Or you can enter other reality systems only dimly perceived and theorized by our time/space consciousness.” – Robert Monroe, Far Journeys

Go to planets where everyone is made of glass, etc?

Q: *I have explored the universe!*
But you're talking about our universe here, the known one, right?
Isn't it one of the first things you did?
It depends on what you mean by one of the first. It's probably not the first 3.
Become a space probe and go exploring out into the solar system, check out the rings of Saturn?
I've never done this at all. Nor do I have the slightest desire to do so. It bores me to tears just thinking about it.
Go to planets where everyone is made of glass, etc?
Never done it and it sounds excruciatingly boring to me.

Aw, you're no fun! Thing is, power itself is nothing, it's all in the experiences. There's no point in deleting everything and remaining in a state of deletion. Eventually you'll run out of Ubik. Thing is, you have already decided to have a human experience. That's why you are here, now. You can't remember it now, but don't you ever wonder how strongly you made that decision? Aren't you ever suspicious of yourself?

Of course. I don't think I made the decision strongly at all. . . . What I've decided in the past is only relevant insofar the obstacles I've created for myself. But as for the forward direction, what matters is, do I still want to be human right now? The past doesn't matter for this.

You. can't. remember. :-)

Who knows what you've set up for yourself? If you wipe out everything, take complete control of your dream, you'll probably end up back here again you know. Probably, you already did this. Perhaps more than once. Definitely more than once. You might spend a while being free from it, but you'll choose to go back in eventually. Or to dissolve completely. And then you'll reform, memoryless, back to the same state again.

Ubik - This substance, whose name is derived from the Latin word "ubique" (meaning "everywhere"), has the property of preserving people who are in half-life.

It's a metaphor for the persistence of you as an active force. It's a literary reference, not serious.

Q: You. can't. remember. :-)

What do you mean?

Who knows what you've set up for yourself? If you wipe out everything, take complete control of your dream, you'll probably end up back here again you know. Probably, you already did this. Perhaps more than once. Definitely more than once. You might spend a while being free from it, but you'll choose to go back in eventually. Or to dissolve completely. And then you'll reform, memoryless, back to the same state again.

You're suggesting that this state has some kind of gravitational pull. I don't buy it. Why do you privilege this state such that it would seem you have to fall into it no matter what?

It's a metaphor for the persistence of you as an active force. It's a literary reference, not serious.

Well, I don't get it. I'm actually reading Ubik right now, and in the novel it is a spray or some other crap that can renovate degraded elements of experience. But I'd appreciate it if you didn't make references to Ubik, because so far I've been finding the whole novel pretty worthless. I'm almost forcing myself to finish it, since it's so short and I am almost done with it anyway.

I'm kind of playing. ;-)

As I just mentioned on the Death-Experience Thread, which is a great post actually, I think staying constantly 'present' is vital, otherwise we are doomed to be forgetful and sucked into a repeat of our present circumstances. It does have a gravitational pull, of course, for those who don't recognise the situation "they" are in (which they're not). But to recognise it for what it is, and remain identified with the background rather than the content, is the essence. You may have chosen this for yourself though. Why can't you remember what you did before Nefandi?

Ubik

Hmm, it's a bit more insightful than that. But each to their own. That and The Man in the High Castle have much to say. Meanwhile, much effort do you think is involved in changing your circumstances?

I agree. It's great and it's something you wouldn't have said. ;)

Ha, dick. ;-)

Isn't the real problem with this topic that there isn't much to say? Once you recognise your true nature, while avoiding making the non-dualists' error of then thinking you have no Will, all that's left is dissolving your discomforts, your boundaries, and ceasing to identify with any object.

EDIT: There is of course the 'bending experience' stuff on top of that, but the fundamental thing is the dissolving.

Don't forget that objects have meaning within convention. If you want to dissolve boundaries which define objects, you will need to dissolve the surrounding context as well.

Yes, but the context and the object are one, or rather they define each other as separate. The boundary joins the two. You dissolve the boundary, not the object or the context, and therefore dissolve both.

Just a second ago you were saying that dissolving is a waste of time because you can't live with a bunch of nothingness. Hehe...

:-)

Ooh, I forgot about these tail ends! :-)

Not abandon in the sense of hating on them, but in the sense of being untied from them and having an aloof, non-committal, weak relationship to them.

You can't have it both ways. If you are aloof, you are bound. Even being non-committal. The universe has to be inside you, in order for you to not be bound by it.

Q: I don't agree. Universe isn't a place. So being unbound from it is not the same as being free to leave some place.

The universe is a concept; that is what you are bound to, implicitly.

Q: You're talking out of your arse.

:-)

I'm in that kind of a mood, I'm afraid (although you do have to let go of your idea of the universe, I'm sure you won't argue with that). How you been getting on anyway? Any successes?

But it's not easy to actually do it in practice because it's like everything in my being is "wired" to treat the universe as a concrete place instead of as an idea with a set of associated experiences.

Yes, this is a problem. Do you do much reading on the subject? I find it helps to always have a book on the go on it, or glance at Berkeley now and again, etc. It was like that when I started lucid dreaming - if I kept reading on it, I could keep at it easier, otherwise I just 'forget' and end up asleep in 'real life' again.

Who knows? It's not often that I can recognize a success instantly.

Yeah, there's something to that. You don't know the impact until later. Never tried fasting. I've just been sticking to the daily exercise thing and keeping my dreams up, plus added magick (riding the "momentum" rather than being too dramatic though).

Q: Yes, this is a problem. Do you do much reading on the subject? I find it helps to always have a book on the go on it, or glance at Berkeley now and again, etc. It was like that when I started lucid dreaming - if I kept reading on it, I could keep at it easier, otherwise I just 'forget' and end up asleep in 'real life' again. I don't really forget. My problem is one of habits. I don't really read about it that much these days. There is not much for me left to read, imo.

It's not really to remember, so much as 'recreate the mood' and help keep habits on track. Anyway, works for me. It's surprising how hard it can be to stay focused, on something you actually want.

Q: It's surprising how hard it can be to stay focused, on something you actually want.

This is a tricky one. You should look into the role of doubt here.

We have no trouble focusing on things we know will work as we expect and we want those things because we already had them in the past and know exactly what they are like. This is freedom from doubt.

Hmm, that's interesting, I think you're onto something there.

...

Q: Yes, but the context and the object are one, or rather they define each other as separate. The boundary joins the two. You dissolve the boundary, not the object or the context, and therefore dissolve both.

I don't agree. I think it's a bit more complex than that. There is more structure to it. If you dissolve the boundary around a tea cup you still have the keyboard, etc. left over. Even if you dissolve all that, you can still have a craving for all that to come back, or a fear of the resulting state, etc. So it's not so simple in practice.

For each particular object and its specific context which is what defines it, holds it in place, it applies. I see what you were getting at now, though: the larger notion of there being separate objects, yes?

Q: I see what you were getting at now, though: the larger notion of there being separate objects, yes?

Yes. When you examine the context of an object, that context has a further, deeper context, and so on. At some point you run out of context and then you hit the ultimate ground of being, ambiguity, chaos, will, whatever. However, before you hit that point there may be quite a bit of structure there and it can be pretty snarled and hard to untangle. There was some yogi who said something like "If the screw took 16 turns to put in, it will take 16 turns to take it out." I think this is pretty much bang on the point.

Right, I'm with you on this. Now, I do think you can circumvent it to some extent - stand back and see that these structures exist, floating in a spaceless place - so that you don't identify with any of the structures even though they are still intact. Until you dissolve them, they are still part of your experience. However, I think even the act of dis-identification itself leads to the gradual self-dissolving of structures. You can speed the process up by direct investigation and exploration of course.

Comparison: The 'dissolving of the Witness' after realisation. You can do this deliberately, or you can let it happen by itself. What tends to happen is that you keep accidentally recreating it though (me).

This generally fails to work, because the second you succeed even slightly, your cravings will flare up in terms of fear, uncertainty, doubt, a desire to return back to the familiar solidity and so on.

The fear is only initial - once you give yourself to it, it's incredibly peaceful! You have to break through that barrier eventually, even if you do it by persuading yourself step by step, as you describe. Why not just boldly step forward? Like the 'rope technique' for OOB, there is an enormous fear barrier that kicks in - of course there is, because your body thinks it's going to die - but once you've passed that, you're good. It's not "you" that desires solidity, the larger you. It's the "small you". You have to abandon that to move forward anyway. For as long as you are giving in to the "small you" your progress will always be limited. In fact, even accepting the notion of "progress" may be problematic?

This is only true when you rest in the knowledge that you'll safely come back to the known world. It's not peaceful when you're getting ready to fly free 100%.

No, really. When you completely let go, you will feel peaceful. And to let go is to let go of the universe, not just the body; the universe is your body. If you truly identify with awareness, surely you know that you are not this transitory content? Fear will arise, and pass, just like any other object in consciousness! Furthermore, you should realise that the universe has been being destroyed and recreated again and again, every moment since you were 'born'?

Look, Nefandi, it's okay to feel afraid. You're going to have to commit fully to this at some point though, so why not now? You're just delaying the inevitable. And it doesn't actually involve any action to do this; you simply have to stop holding on. Holding on, I might add, to things you don't actually want anyway, according to you!

Why not, this weekend at some point, just lie down on the floor and give up completely?

That's a tautology. The point I was making is that generally no one can completely let go overnight or even in one lifetime. It's doable as a process that requires long-term application and unbreakable resolve.

Why not?

Awareness is the least important aspect of the mind. I identify with the mind, not awareness. Awareness is how all the delusive junk gets generated. Awareness is mostly the function of sense bases and its output is mostly garbage.

Awareness as a synonym for Consciousness is a synonym for Mind (large-'M'). The word is not important, it is the vastness that you really are that I am referring to; the context for all experience. You are confusing "Awareness" with "the content of Awareness, that your attention is drawn to". Even your use of the definite article - "the" mind - shows you are on the wrong track here. You are thinking of non-identification, while operating very much from an identified perspective. Like "enlightened" people who, upon investigation, are just relentlessly thinking about being enlightened, rather than actually being.

It's not inevitable. It's a choice. I am feeling the weight of the choice. Talking about inevitabilities and eventualities is the cop out of fatalism.

It's inevitable if you want to get anywhere with this.

Why not, this weekend at some point, just lie down on the floor and give up completely?

No, you didn't. Not really. You are afraid and you are holding back. You are not truly committed to this. You are attached to a perspective, gripping onto it with white knuckles.

It's also not obvious that knowledge is important if you speak of awareness.

Of course it is. Knowledge is to become. To have something within awareness is to know it. (Note, not be aware of, which would be dualistic.) But each to his own. Capital-'M' Mind works just as well.]

No it isn't. What is inevitable is the freedom of choice.

If you want to get anywhere, you will have to break through your fear. And you refuse to do this. You are making excuses. You are afraid of being separated from your body.

Knowledge is to become. That's too limited.

How so? It doesn't preclude changing things. And delusion is revealed by seeing the nature of the experience through this. There is a difference here that we're jarring against: There's a difference between the recognition of the state of things, of dissolving boundaries to experience this directly (basically, getting rid of the "snap-to-object" property of Mind/Awareness, getting rid of the power of your Platonic types), and of actually destroying the universe, the 'X'.

I am not. I am afraid of losing the universe as I know it, of having no future, etc.

Why are you afraid of this? You write as if this is what you're aiming for anyway (the destruction of the universe). If you destroy the universe, you won't destroy the fundamental "you".

Don't you have a yacht to manifest ;).

But I want to sail my yacht on the waves of infinity, the disconnected Nows of Platonica, to be both the ship and its wake, the Caused and the Uncaused! ;-)

Q: Is that so? I thought you just wanted an ordinary wooden yacht like this one.

At a minimum, this - just while I'm still messing with only four dimensions.

Q: I notice your story is changing wildly from time to time.

In what way? It's pretty simple, if convoluted, and I've gone backwards more than I've gone forwards, particularly in my representation of how it hangs together, but that's just how learning works. Happy to discuss anything. You, meanwhile, seem... to talk ahead of the game? ;-)

Of course, **there is no time.**

Q: *You, meanwhile, seem... to talk ahead of the game? ;-)*

Not at all. I keep my eye on the prize at all times, even as I address my current state. This does require a broad mind, sure. I can't just ignore my human condition and dream about the prize or vice versa, think about the now and ignore the prize. My contemplation must be wide enough to embrace convention and that which is beyond convention. It must embrace my current fears and the desired state beyond fear. This is how I train myself.

Well, that all sounds very nice. :-)

Being a little more serious... To be honest, I keep switching between whether to force change or to let it happen in its own time.

You can switch perspective instantly - detach from your perspective - and that takes care of identification in the obvious sense, but you're still left with, as it were "convention" in your experience. You can be 'enlightened' as in, see how things are, but then you are left with making changes to the structure of your experience. You don't need to do this, you can 'live from the knowledge' despite the content, but why wouldn't you?

'Overwriting' works and is powerful but has after-effects, and isn't necessarily pleasant initially (you know this). 'Deciding' and detaching lets things unravel in a spontaneous way, and is not unpleasant, but it does take "time". So I'd say, attachment to "yachts" is indeed my thing. I don't have fear, so much as I have attachment.

I think that knowledge has different levels of penetration, acceptance, and stability.

Yes, all true. I can reliably return to the 'right perspective' at any time, that's not a problem. And when I relax, or sit back, that's the default perspective now. In this way, you have the "mental objects" you've accumulated, but they don't affect you in the same way as someone who hasn't a) had the realisation and b) adopted the perspective. But in times of stress...?

And in an emergency, do I remain detached? Actually, I'm better in an emergency than in boring times at this. That's when I fade out, the 'tension of boredom'. Less and less so as I've been doing my exercises (because there's less to "fall into"), but that is definitely a thing. Although I can directly enter dreams if I commit to it, I don't have persistent awareness if I don't. I should be present at all times in the sense of carrying over, but I'm not. And that's the test, isn't it? Can you bring this out into the world?

So either fatalism or flippancy, and all this I find bad.

Well, flippancy I'll admit to. Hmm, I'm probably on the fence a little at the moment, because I do know what works, but I'm uncertain now on how active one should be. Until recently, I'd say the active approach always, but having experimented with reducing the level of action to its absolute minimum, in an attempt to get to the very root of 'Will' (as I thought of it at the time), I have dithered a little. In actual fact, the reason it has left me undecided is probably because they're both the same thing: actively dissolve barriers, or create the environment, thus increasing the efficiency of the second approach, due to the elimination of resistance. Make sense?

I don't mean just fading out. Fading out, detaching from the situation, that's nice.

By fading out there, I mean losing the perspective. So when I'm bored, lacking in energy it's like I'll get distracted, and fall into mental objects. Yes, this view should be one's first 'port of call'. Break your ankle? Your first thought should be to reverse it. Car crashes over the barrier? Just reset time.

Actually, you've unintentionally pointed out something that I do too: Your solutions are still inspired by the idea of being a body or in a solid environment - e.g. "levitating", "teleporting" - or that it wasn't under your control in the first place. In other words, ambitions could be much higher than this. I don't use it nearly enough. I go through phases of doing the 'nightly rewrite' (Goddard style), but then forget about it. Similarly, each day you should decide what's going to happen before you set out, but again I forget it. So I might have the perspective of 'being the space' - the correct identity - but not the perspective in its active form, that of directing the experience. That's what I'm trying to work on.

What do you mean by "create an environment?"

Not great phrasing. Two meanings: Firstly, there's dissolving barriers verses just overwriting your bodily space, etc (going directly for what you want). Then, more advanced, would be to directly change the scene around you, and within you, more completely.

Cause right now I do feel very narrow-banded with all that convention and solidity on all sides of me.

Do you experience that solidity as a 'felt thing'?

... then during a high emergency she'll pull off a miracle.

I've studied a bit of that for a while. Mostly they occur as 'reality shifts', not deliberate. Actually, probably deliberate in the sense of a reaction, but without understanding of what was being done. So more of the order of a 'prayer' that gets answered. Again, a motivation for my 'just decide' approach, since a prayer does not involve effort - but it does involve focus, mind you.

And I want to be more creative.

I'm pretty creative generally. Probably more creative than practical, actually, by a long way. This can be debilitating as well as empowering, because I do get sidetracked. I see this 'work' as a way to focus this more, hopefully.

Don't leave me hanging.

See later - - -

Those are all really cool exercises.

The point is, there seems to be a tendency to forget these things. 'Everyday life' has a sort of force to it, a gravitational pull against the unusual. Which of course is one of the motivation for dissolving, etc. Anyway, I figured that if I couldn't yet rely on operating actively from this perspective during spontaneous situation, then at least I could do the before/after and manage 'reality' that way. Just because you can't do it all yet, you can still leverage massively what you can do. As you said, it's all a bit easier when our lives are comfortable. Well, let's make use of that then. In those comfortable moments, we take advantage and set things up in anticipation of the uncomfortable moments when we won't be on the ball.

This is a pretty God-like level right there.

Yes, yes it is. It's a complete commitment to and leveraging of the power of subjective idealism + magick. Fast travel seems to be a good starting point. But then we think, well, that's still within the conceptual framework of a spatial environment that I am somehow 'traversing'. Do I need that? Except that it is an enjoyable experience or whatever, to mostly live that as your base level. Y'know, like sitting down on top of a mountain and enjoying the view, the experience. And the aim of this is to have enjoyable experiences (because there is nothing else, as I see it). If instead I view everything as a configuration space - that is, a set of all possible Nows (like the link I included on time), a Platonia, that I can navigate.

Solidity and the felt thing.

I still think the 'felt-sense' thing is the vital aspect to this. That sense is the way we get 'under the hood' of, say, the appearance of the senses, into the global sense of structured experience. That's where it arises from. Changing that is what changes apparent experience, because they are the same thing, through different perspectives/angles/senses.

For creativity, you just have to let loose and try stuff out. It's a "letting happen". I was going to recommend a couple of books, but then I realised that what happens is we just read about creativity then. Get a pad and a pen, and just start doodling and see what comes out. There's a "feel" to that which is the same "feel" for other creativity. Despite what I just said, Edward de Bono's books (Lateral Thinking and related) have some approaches for a more, deliberate and rules-based angle on generating new ideas though.

Ornamental

Yes, a great way of putting it, but it can miss something fundamental. Experiences aren't all just visual fancies, there is meaning involved too, felt meaning. That's what makes life worth living. Something occurred to me reading your response: I may be misreading, but I think you seem to be quite focused on the negatives of life, of being a human life that is, and seeking to overcome that? But there are positives too, and the purpose of pursuing this stuff should be towards a positive rather than escape from a negative, I think. Actually, I think that orientation is probably vital to success and speedy progress.

Right now the only reason I live is because I know I can rid myself of this heavy and sticky meaning I don't want.

No, no, change the meaning, or generate experiences with better meanings! Often the meaning isn't truly bound to the experience, as you might think. You are giving "humaning" a bad rep it doesn't necessarily deserve! ;-)

The 'overwriting' exercise is of course about stripping meaning, or rather habitual, historical meaning - but that doesn't mean there isn't going to be a 'felt-sense' associated with experiences in future. It's just going to be of a clearer, more direct quality.

Q: *No, no, change the meaning, or generate experiences with better meanings! I am doing this and it takes me away from humanity and Earth. My heart doesn't belong here friend. I am sincere. I think I will probably die soon and it doesn't bother me one bit. I won't miss anything and wouldn't want to be missed by anyone.*

Aw, rubbish to that. You realise that, at a minimum, you can just become a different character in the meantime? It might take a long time to delete mental objects overall, but you can assume a 'posture' at any time.

Q: *I already became a different character. I am no longer a human. That's what's different about me. Now that I am not a human I am also working on getting out of this place. I detest this planet and all that stands upon it. There are good aspects to everything, but for me the bad makes the good worthless. This is why I am so into regaining control over my own mind in the first place! Don't you get it? If I loved being a human, why the fuck would I want more mental power? Why would I want more personal power? For what? I need all that to get the fuck out of "here." Where "here" is this state of mind that produces humanity, Earth, and all this shiite.*

I do get it. That's why I say what I say. But you are wrong about "the bad".

Q: *I can't be wrong about it. My feelings can't be wrong.*

You are wrong about feelings not being wrong, sorry. Stick with the overwriting, see how you do. The very idea that you would pursue this approach with the idea of escaping something - be that humanity, or a more local difficulty - shows you've got a couple of things to delete, before you can get what you want. You will have to go into these things anyway, in order to dissolve them, as I'm sure you've realised, because that's how it works.

(Overwriting can't occur at a distance, from "here" directed at "there"; it only works if you are present and co-located with the aspect you are overwriting as part of the larger space.)

Q: *You are wrong about feelings not being wrong, sorry. Stick with the overwriting, see how you do. I just deleted this line. My George never said this. How's that?*

Deal! :-)

I guess that really, I meant that if everything can be adjusted, then feeling can be arbitrary and adjusted too. That make more sense, better worded? But then, I'm really talking about "feelings" rather than "felt-sense" there.

Q: *I love hating humanity and Earth. I don't want to adjust that. It's the motivation behind all my efforts. That's what gets me up in the morning and that's why I don't slack off in contemplation and meditation.*

Humanity appreciates your efforts! :-)

Q: *I just recently (relatively) realized a bad habit I have. I get bored, so I look for entertainment. Ideally I should make use of my own mind as an entertainment source. Instead I tend to look for the products of convention such as books, games, watching cartoons or movies, etc. I probably don't want to quit cold turkey. But it would be reasonable if I could entertain myself for 1 hour just by using my mind. And I specifically mean entertainment here and not contemplation. So this mind-entertainment time should be as close to playing a game as is possible, for example.*

Have you read Nikola Tesla's biography? One of the things that inspired me to try and make 'mental machines'. Instead of making prototypes, he would create his inventions in his mind and set them going. He would then return to them, months later, and examine the components for wear and tear, then improve his design and set it going again. That's a level to aspire to. Anyway, I used to avoid taking an iPod with me, and instead generate music in my mind (I've always been into electronic music, used to write a lot) as an exercise. Or when travelling, close my eyes and replace the sense of my surroundings with a different location as vividly as possible. I never really made the leap to see the full possibilities, but there's no reason why that couldn't evolve into playing your own internal FPS, or No Man's Sky.

Nice... but then what kind of game should you play? I think it really needs to be a game. Observing a static image is not my idea of gaming. Being able to play an RPG or an FPS in my mind would be fucking amazing! And it's massively more immediately attainable than controlling "physical" reality, which is still my goal. ;)

:-)

Right, this is attainable. :-) The link I included was to No Man's Sky, which is a procedurally generated space exploration game. It's basically an infinitely explorable world, seeded randomly. So having all that appear "just in time" as you were exploring would be pretty powerful. However, I'd quite like do an internal Parkour game, because of all the physical sensations that this would involve. A nice challenge, beyond simply having something you were exploring 'visually'. Also, internal versions of adventures like this.

Interesting. I don't do parkour, so there is no reason to think I'd be any better at it inside a visualized space.

Are you serious with that response?! That's the whole point! You'll be great at it! And you'll be able to fully realise it, with dedication. Do you think Nikola Tesla knew what it was like to be a cog, or a component, or that he had direct experience of all aspects of his machines? You are drawing on a larger 'reservoir' of structures and knowledge than your own, personal ones. That's how you can lucid dream a whole world, and have that world surprise you.

Maybe I can invent a visualization game for each of the 6 senses. I think astral projection is almost like an RPG already, and so is lucid dreaming.

Indeedy! This is basically semi-lucid-dreaming, if you think about it, by being 'parallel-aware'. You start simply. How I started was, when I was studying, I used to drink juice out of this red plastic mug with a handle. So, when taking a break, I'd created this in my imagination visually, and then try to 'feel' it too. that, and I had this symbol, a circle held within a triangle, white line drawing on black background, which I'd flip and rotate whenever I was bored. It didn't take too long for those to be 'real'. Note, it helps if you, while doing a relaxing exercise or whatever, reinforce your abilities by 'deciding' them to exist.

In principle I should be able to reach some kind of divine inspiration that teaches me parkour, but I am not sure I want to invest energy into that specific type of imagination. I just don't want to parkour I guess.

You're right in that: If all this is you, then all the knowledge and the sensations are already enfolded within the space you are experiencing. You can be a master guitar player, speak French, parkour to your heart's content. Or... not, if you don't fancy it. But if you are serious about this, the abilities - which, remember, just correspond to summoning a particular experience - are all there, already.

Now how do we attach a score to this? :) hehehe I mean, you're talking to someone who still likes conventional video games.

Heh. Right, I'll set it up some trophies and unlockable content based on how vividly you render the cup! If you get to the top of the leaderboard, you get can upgrade to the cup of a carpenter.

Q: Lol, no sound in the video clip, so there was no point in putting it there, imo. Pay attention.

Darnit, wrong one. But I'm sure you get the reference. :-P

...

More the question: how many human years has he got to go? Answer: lots and lots... ;-)

Actually, we aborted this part of the thread and moved over to the other branch, if you are looking to continue reading.

...

Q: I'm filing this exercise under "interesting stuff I may want to try later." But I agree 100% with your "decide" message. The trick is to stop deciding small stuff, like money, house, sex partners. I have decided I no longer want to be a human. I am dreaming big. This planet is too small for me.

Well, the main "decide" is to "decide to be the awareness in which this experience arises". And it works, instantly. Then it's all yours.

EDIT: Also, why not decide the small stuff too? It's not like there's any effort involve. You just "get it" for free. And if things don't go your way, delete them and replace them. Another way of saying this is: inserting new facts into your world

...

***A1:** This post is super old and has less up votes, but bro if you are seeing this, you were right, literally just decide and have faith in that decision and it's all yours, everything, even the impossible*

The Patterning of Experience

The Patterning of Experience

This is just a quick bullet-point summary of the memory-pattern-based view of experience, plus guidelines for selecting experiences. I have a more expanded description but I haven't written it up yet (and it's probably not required here). You might use it in conjunction with the Imagination Room metaphor and the Imagining That post to help provide context.

The Static

- What you really are is an open space of awareness.
- Dissolved into the background, implicitly, are all the patterns that ever were, although they are only very subtly present and barely activated.
- Your background felt-sense is the global sense of all the patterns you are holding on to (the facts-of-the-world).
- All sensory experience is the effortless and spontaneous arising of patterns in alignment with the felt-sense. The shifting of the felt-sense is how we actually select experience.

The Dynamic

- The content of the senses and your apparent history have no necessary impact on what happens next, if you are detached from them.
- All that matters is the patterns you are holding onto right now.
- If you trigger a pattern it will subsequently arise in your experience (both thoughts and senses).
- Recalling or experiencing part of a pattern in any way triggers the whole pattern (and to a lesser extent all associated patterns) via auto-completion.
- Every imagining is a 1st-person pattern and all bring about an experience:
 - If you imagine doing something from a 1st person perspective, you are imagining “me doing this” and you will later experience yourself doing it or something like it.
 - If you imagine doing something from a 3rd person perspective, you are imagining “seeing myself doing this” and you will later experience someone doing it or something like it.
 - If you imagine an owl in front of you, what you are doing is imagining "seeing an owl". You will subsequently see owls. Everyday people call this "synchronicity".
- The pattern will overlap with other patterns you are holding onto. This is why it does not immediately become your experience. It is immediately true but your other patterns fit it into a time framework.
- The more detached you are from sensory experience and the felt-sense, the more swiftly and completely the pattern becomes experience. If you had no time-pattern at all, it would be immediate.
- Note that an emotion is a sensory aspect. To hold onto an emotion is to trigger or retain all patterns which have that emotion as a part of them.

The Angle

- Define and assert yourself as the open space of awareness in which sensory experiences appear.
- Remembering that all imagining is in the 1st person and is the triggering of a memory-pattern which will come into experience - you should always imagine from your own perspective.
- Patterns are manifest immediately from the perspective of time. “It is true now that this happens then.”
- Ultimately you should aim to detach completely from the sensory experience round you (what seems to be going on) and from the felt-sense (which is a summary of the facts-of-the-world you have accumulated).
- The more detached you are, the more you can simply “just decide” on something (the partial imagining that is the “decision” will trigger the whole pattern via auto-completion).
- In the absence of complete detachment, allowing the decision pattern (which will typically just be the feeling of the decision) or an imagined situation (a sensory visualisation of the desired experience) to intensify before letting it go will prioritise it over other patterns.
- It is fine to re-decide or re-imagine a pattern provided your decision does not contain any temporal-but-non-specific details of the path of manifestation, even if just implied. Otherwise it will be essentially recreating your future pattern again.

...

Q: What do you mean exactly by "background felt-sense"? Do you mean this sort of "noise" that you can feel filling the gaps? And I'm very curious to know how you got to the conclusion that it's the global sense of all the patterns. Also, I don't know if you've posted it somewhere already, but I would really love to learn about your experiments with manifestation.

You can directly experiment with this. First I'm going to say: you are experiencing your entire world right here, now. All of it. You tend to thing of the big shining images, sounds and textures as it, and then emotions and feelings, but that's just the unpacked part of the whole thing, which is here too as a sensation. But it's obscured, like the sun hides the stars. You use it all the time. It's everywhere, but you find it by going to that feeling roughly in the centre of your body. Very subtle. Go to it, with a question in mind, the answer comes from there. Your intuition comes from there. Your whole body experience actually arises from this. It's the entire patterning of the Imagination Room, you might say. When something changes about your world or in your person, that's where the shift occurs.

Q: Yes, I know this. This doesn't answer my questions. Or perhaps I misinterpreted some parts of your post. When you're talking about the "background felt-sense", you mean a particular sensation (or a particular type of sensation), right? I've just never really experienced a collection of all of my reality-shaping habits. I've only experienced them one by one, as I caught them shaping my reality.

Actually, it was probably me that misinterpreted your question. And it's the area to be expanded in future.

I've just never really experienced a collection of all of my reality-shaping habits.

In truth it is always contextual in terms of what is clear, right? It is always responsive and unfolding. But everything seems to be in there if you go looking, vagueness comes into focus. I don't think you can experience all of your habits separately and all at once. That would be like trying to experience all colours separately but at once - you just get white.

Does that make sense?

In the post I was mainly trying to highlight that you can't make changes (personally or in your world) if you are restricting the movement of this - e.g. the feeling that comes up associated with an intention and you resist it or push it or whatever.

What is actually a habit?

A very good question!

I say, today: An experiential pattern, the whole pattern being triggered from part of it, just like with any memory pattern. Which is why the way to stop a habit is to disrupt the pattern by dissolving the emotional aspect of the trigger, or breaking the sequence (can do this via imagination, summoned from the felt-sense?). It's no different to, say, thinking of the start of a favourite song and it then continuing in your mind. Only this time the result is played out spontaneously in the main area of your imagination, as it were.

Is it an on-going intention?

In a way, it is right? But I think "intention" has become a difficult word since it gets used as something in mind that you're then going to "intend". Maybe we could say: An intention really is just a pattern of experience you've created, either a one-off (you create a temporal pattern which manifests something in the future) or something more general (you create a pattern which manifests in certain circumstances) or a "fact" (a static background pattern that filters everything else).

(If I'm understanding you correctly...)

What I'm trying to figure out is, why do habits make it seem like we've forgotten how to intend? Does this mean that intending is also part of the pattern?

I think it means that people never knew how to change their experience anyway. Sensory experience is arising and as it unfolds they are imagining nothing useful. People simply don't realise how the work. They try to "do" things by summoning up muscle tension patterns, or ineffective verbal thoughts patterns, or actually focusing on the troublesome pattern more.

Want to kill a habit? Activate that pattern and activate a neutral pattern (such as the experience of complete empty space) at the same time - or some other stronger pattern. If you generate a strong emotion then that can help. (The Overwriting Yourself process is about getting rid of residual perceptual patterns in this way.)

Intending is deliberately "deciding", but deciding is simply activating a part of a pattern and having it auto-complete. What makes out an "intending" from another memory pattern? It's: the temporal pattern. Activate a sensory event pattern and a temporal pattern at the same time, and you've effectively updated your "timeline" (whatever you want to call it) with that event.

And so on.

So, this is always about summoning a memory pattern or two in order to strengthen them so that they shape your subsequent sensory experience. Mixing patterns provides context and organisational structure. We've already got some pretty deep formatting - such as temporal, spatial location, all sorts of other abstract frameworks, our own body pattern - we can leverage. And there's all those accumulated facts-of-the-world too. The infinity aspect can get out of hand pretty quickly, so I always treat something like the Infinite Grid concept as my baseline. Experience works on an "as if" basis, so whatever metaphors you adopt, your experience will seem to fall in line. Using this knowingly keeps things in hand - rather than going on meta-adventures via synchronicity. Choose your fictions wisely!

Q: Can you rephrase the last bullet? I'm having a difficult time grasping that

On the felt-sense? To experiment, literally place your attention roughly in the centre of your body, perhaps nearer your lower abdomen. And wait quietly, to feel what is there. The feeling is what you might call the "global sense" of your whole situation. It's much easier to do than to describe! Give it a go and get back to me if you don't have any luck. Eugene Gendlin's Focusing technique is based on something along these lines; you might find it interesting to look that up.

Q: No I meant: "It is fine to re-decide or re-imagine a pattern provided your decision does not contain any temporal-but-non-specific details of the path of manifestation, even if just implied. Otherwise it will be essentially recreating your future pattern again."

Ah, right. The idea is that if you just think "I will see owls", without specifying any details, then "owls" is overlaid across time. If you keep thinking "I will see owls", or "owls are cool" and "I really like owls" that pattern doesn't get disrupted. However, if you thought "I will see an owl on Tuesday", and then start thinking "no, owls on Wednesday" or "will I see owls on Tuesday?" then you are mangling what you've already laid out. You are revising your pattern.

Q: I see, so consistency in your thoughts is preferable?

Yes. Passing thoughts are fine, let them rise and fall. With intended thoughts, though, you should stay consistent, because you are effectively rewriting yourself each time you do it, creating a muddle if you keep changing your mind!

Q: Thanks for this recap.

Your background felt-sense is the global sense of all the patterns you are holding on to (the facts-of-the-world)

So if I understand this correctly the background felt-sense is the knowledge of what your world consists of? Memory of places and people, senses, forms, etc?

All sensory experience is the effortless and spontaneous arising of patterns in alignment with the felt-sense.

So that which arises is limited to that which you perceive as possible. Is that what alignment with the felt-sense means?

The background felt-sense is (as I tell it) all the persistent facts-of-the-world you are holding onto. Obviously there are levels to this, patterns upon patterns. Something I've noticed is that even when there are stuck sensations elsewhere in the body, they are referred by this central sense. Which makes, um, sense really!

So that which arises is limited to that which you perceive as possible. Is that what alignment with the felt-sense means?

All experience arises from the felt-sense. If that is your world and you are navigating through it, then you are basically exploring the world as dissolved and summarised in your felt sense. You can do a little experiment. As you go about your day, exploring the world and exploring your thoughts, notice how you do it. Despite what you might assume, you actually seem to navigate by feeling your way along. In quiet moment, settle your attention in the centre of your body and explore the sensation. Ask it questions and see what you get. The entire state of your world is potentially available for exploration. If nothing else, it's free transformative therapy on tap! :-)

(Quick response, but this is "the" topic, although having a model of it is not entirely necessary for getting on in your world...)

I've begun to get more and more familiar with this sensation. I consider this to be the source of all of it, am I wrong in stating this?

This is how I view it. Everything is in there. It's an area that would benefit from some proper coverage! I've not really explored how best to describe it.

I'm calling them other sensations but perhaps "the sensation" is the amalgamation of all sensory experience.

It's all patterns, your entire state. When you go exploring through levels and such, that's where you are exploring. The perceptual sensations (images, sounds, textures) appear spontaneously as you unpack patterns-objects from there. For fun perhaps we could view it as our Global Lightbee which projects everything in our Imagination Room. I'd love to hear your thoughts on this, especially how you feel we are perceiving ourselves at all? I view it currently as the Self created other (or perceived exterior) in order to have the necessary contrast to perceive itself. It depends on what you mean by "ourselves". If you mean the thoughts, bodily sensation, etc, we identify with, that's just a habitual pattern. Think: how do you work out which bits of experience are "you" and "other"? By spatial proximity, by whether there is a feeling within that spatial proximity, by the timeliness of response between you "asking" and "receiving" and the case of inner-outer distinction it's subtle things like whether "other people" seem to respond to them.

These are arbitrary.

As soon as you experiment with synchronicity and intention, you realise that it's just all imagery arising within you - the undivided open aware space - and you are categorising different images-objects-patterns according to their intensity and location. When you come to the idea of the floor of the Imagination Room, or the Global Centre of the felt-sense, you then view all of this as just spontaneous imagery from an exploration of that.

I'm more curious how we're able to perceive period?

I think on the one hand it's impossible to answer (EDIT: I offer no other hands, it turns out).

All we can say for certain is:

- We are a consciousness.
- Experiences arise within and of that consciousness.
- We cannot experience ourselves "doing" or "selecting", which implies that we "take on the shape" of experiences.

We can only think in terms of 3D sensory images, we use metaphors to extend that, but we can never truly think-about these things - such as what we "really" are, how did experience come to be formatted the way it is, and so on. Thinking about those things creates a self-patterning chase of one's tail that we can't get out of. The reason for that is that we think experience and think about things using the process that that experiencing and thinking follows. As I said elsewhere:

Even worse, the more you try to get a handle on the whole synchronicity thing itself, the more incoherent, confusing and "meta" they will become. It's like a dream trying to work out how "dreaming" really works behind the scenes, and just ending up with... more dream, only this time about the subject of "dreaming". - TG

Whatever you think, formats your experience. There is no "how it is", only what we assert. All we can do is choose a pattern which is stable but flexible, and use that as our base. Experience behaves "as if" there is a static wholeness that we are exploring. And it behaves "as if" we bring aspects of that wholeness into experience by "remembering" them. I think that's as far as we can go.

I feel that there is static wholeness, but how are we able to explore the wholeness as though it is separate and to form these wild patterns that vary and differ?

We let ourselves feel separate from experience by designating one part of it as "us" and hold onto it, letting the rest change. Even "being the background" is a subtle version of this, albeit the most flexible version there is, and the one I go with, because it effectively attaches identity to "the consciousness" rather than "the world".

TL;DR? Stop trying to work out how things supposedly are, instead just decide how you want them to be?

(Going to tag on a thought process in the next comment...)

(From elsewhere, but relevant perhaps when it comes to asking what we can truly say about our experiences, what is permanent and fundamental, and what is changing and so cannot be. Maybe other Oneironauts might find it a useful exercise.)

Exploring Direct Experience

Here's how I have proceeded before, from empirical evidence:

- It appears that am a conscious being of some sort. No matter what happens in terms of content, this persists. I seem to have no permanent structure. It is the one certainty that does not need interpretation.
- During waking hours this conscious being it seems to have the experience of being-a-person.
- Within my perspective there appears both thoughts and perceptions as a seamless experience. I don't perceive either to be external to my being, however I notice they are of two levels in terms of behaviour or impact and I make a distinction between "private/inner" and "public/outer" as a result.
- I notice that I am not simply a passive experiencer (although through experimentation I notice I can just let things happen "by themselves"), I can also "intend-imagine" changes in my experience.
- Having noticed that this waking experience seems to be associated with a body, and seeing other bodies, I infer that there may be conscious beings associated with them, having a similar experience. (However, having noticed how my own activities can occur spontaneously and without direction on my part, I quietly note that I can never be certain that activity equals an experiencer.)
- I notice that I am the occasional recipient of information that is beyond the context of my present experience. Sometimes intuitions about the current situation, but at other times knowledge which implies that situation I have not yet encountered are in fact already created in the background and awaiting my experiencing. This and various other things remind or suggest to me that I am not in fact a person so much as having a person-experience - I am not of this world but I have allowed this world to arise in me (or something like that).
- Exploration of phenomena such as synchronicity reveal that the inner/outer distinction I use for convenience is not as solid as I usually assume. They suggest that usual assumptions about the unfolding of events, coherence of narrative, and our simplistic "world-sharing model" are probably not solid either. However, since phenomena such as synchronicity get "meta" very fast, with an affect akin to exploring your own memory-patterns, it is best not to involve oneself too deeply.
- **All experience I have seems to arise within and of and be made from the consciousness that I am.**

Now, from this we are left with what I think are unanswerable questions or meanderings one has while exploring the above:

- What am I really, really? I can only know what I'm not. I seem to be just impersonal consciousness.
- I experience being a person or a mind, but I am not one.
- This "world" I connect to - does it exist only in this consciousness?
- Am I connecting to something or am I imagining something? Perhaps I am taking turns at being each of the people in that world, only I cannot remember being one when I am being the other.
- The previous point might explain why sometimes events "bend" in my direction in unlikely ways and even at the expense of others. I am that world's God having a person-experience, however so is everyone else in turn (and being-a-person limits one's "powers").
- The world might be structured so that every person-experience is responsive in this way, because its "sharing model" is not as simple as "people in a room, choosing the consensus decor together".
- If I have an OBE or NDE or (to a lesser extent) a lucid dream or (to a maximum extent) when I die, am I disconnecting from that world and connecting to another? Or is it revealing that I have basically been having a custom dream all along? Or is it revealing that there is always a next moment to experience, at the same level, and this never ends?

Of greatest interest to me is what the "world-sharing model" is, if indeed this is something that can be pinned down without encountering the synchronicity mind-formatting problem (that the metaphor you adopt tends to filter your experience). Are you and I both here at the same time, in the same place, in a straightforward manner?

Anyway, from there we end up with the Patterning of experience, the uses of metaphors such as the Infinite Grid to help us format ourselves better, and so on. Another version of that "patterns + eternalism" view which can be used for "as if" exploration:

The Hall of Records

Imagine that you are a conscious being exploring a Hall of Records for this world.

You are connecting to a vast memory bank containing all the possible events, from all the possible perspectives, that might have happened in a world like this. Like navigating through an experiential library. Each moment is an immersive 3D sensory image. And there may be any number of customers perusing the records. So this is not solipsism: Time being meaningless in such a structure, we might say that "eventually" all records will be looked-through, and so there is always consciousness experiencing the other perspectives in a scene. At the same time, this allows for a complex world-sharing model where influence is permitted, because "influencing events" simply means navigating from one 3D sensory record to another, in alignment with one's intention.

This process of navigation could be called remembering. Practically, this would involve summoning part of a record in consciousness and having it auto-complete by association. This would be called recall. You can observe something like this "patterned unfolding" occurring in your direct conscious experience right now.

Q: So let's say I imagined a desired experience in 1st person, and then I detached completely from it. I then go about the following days acting on my intention (in alignment with my intention of experiencing the desired pattern) without any expectation whatsoever. Would this interfere with my desired pattern manifesting itself? I'm asking this to find out if actively acting on something that i have already imagined will interfere with the pattern manifesting itself. Hope you understand my question. Cheers :)

So I think you're asking: if you intend something, and then later keep self-consciously acting to try and make it happen, will that work against you?

Generally, you do the intentional act (imaging here, water-pouring elsewhere) and, since the world is literally updated at that moment you just carry on with your life, knowing that the change has already been done. Since your body movement is as much a part of the world-pattern as everything else, you'll let that carry on as normal too. If you happen to feel the urge to go somewhere or say something, you let it happen; there's no purpose in trying to work out what to do. "Don't interfere", is the phrase to have in mind, because interference amounts to re-intending. However, since your main intention was probably a much more strongly activated pattens than your little interference, you tend to find you result really tries to push through into experience, whenever an appropriate gap or context arises.

Q: Quick question, what's a time-pattern?

It's the organising concept or pattern of "time", in the same way as "space" is an organising concept. The idea being that neither time nor space are existent "out there"; both are part of your "human experience formatting", in the same way as the senses are.

To expand -

Just as you might pass your attention across things (spatial objects) in a pattern of "3D-space"; so you pass your attention across the events (temporal objects) in a pattern of "time". The patterns are defined and format experience, like the colour spectrum is defined and formats experience - they place structure upon and as content. Unfortunately, the idea that a spatial scene exists and is defined even when we haven't fully viewed it, is ingrained in most people, whereas the idea that a temporal scene exists even though we haven't fully looked at it, is not. In both cases it's better to say that the formatting or environment-context is defined, but the content is not.

Multidimensional Magick

Introduction

This might be of interest. Several groups of people have tried "world jumping" in the past, using different systems of thought or concepts. Links below are about an approach called Tesseract or Multidimensional Magick. I've quoted some of the key paragraphs to save you wading through the whole lot. I'd suggest that the details of the process described in the main document aren't so important - it's just another version of the approach 'relax your hold on yourself and the world, allow it to change'. More interesting is the larger context.

Meanwhile, everyone should check out the movies Coherence, The One I Love and Safety Not Guaranteed for inspiration and 'the feel'. Further suggestions from comments elsewhere: Ursula K. Le Guin's The Lathe of Heaven and the recent pilot for The Man in the High Castle based on the excellent Philip K Dick novel. Ari Folman's movie The Congress also captures the notion of alternative simultaneous worlds.

Ebony Anpu & Tesseract Magick

One approach to world-jumping was Ebony Anpu and the Hawk & Jackal system of Tesseract Magick. You can read some thoughts about him here. One Tesseract story comes from a personal recollection:

I know that I promised not to tell a tesseract story, but since tesseract magick was probably Ebony's greatest contribution to the technology of Thelema, and because (though a trivial incident in itself) it served to convince me of the evident power of magick to transform one's universe I will include it here after all. I had for some time been hearing incredible reports about the efficacy of Ebony's tesseract workings. Being rather skeptical by nature I was somewhat dubious and didn't at all credit the reports I'd heard. One day in late 1987 or early 1988 I was visiting at 41st and Opal where I'd often go to rap with Ebony, listen to him play his magnificent, bluesy fuzz guitar, and share some sacrament. The conversation turned to what I'd recently heard about his tesseract workings. He laughed at the reports, but he didn't deny them, and he offered to take me through a tesseract ritual so I could see for myself.

"But you have to be ready for your universe to radically change.", he said. "Can I control how it will change?", I asked. "'fraid not", was his succinct reply. As I was rather satisfied with my universe at the time I declined his offer. "Well, let me just show you what it involves.", he said, and I agreed that just having it explained couldn't do any harm.

So he went over to his desk and brought back a slim calligraphic manuscript. As we sat on the sofa he showed me, step-by-step, how the Hebrew alphabet could be arranged to form the geometry of a tesseract (a "four-dimensional" cube; sort of to the cube what a cube is to the square). As he finished up the explanation he flashed his characteristic smile, devilish and angelic all at the same time, and said, "Oops, looks like I took you through it after all!". I wasn't upset by this, I didn't believe in it anyway, so I went home without expectations or anticipation about how my universe might change.

That night I set to making dinner, but when I turned the knob to light the burner under my pan of water for the pasta, the burner behind it went on instead. I had been living in this apartment for close on five years. The inner knobs had always lit the front burners and the outer knobs had always lit the back burners. I got one of my room-mates to come and see. "But that's the way it's always been.", he said. No one else remembered it the way I did.

Later that night I called Ebony. He laughed, but he seemed impressed, "You must really be doing your will if that's the only change your universe needed to balance it." Considering some of the horror stories I've heard related I'm grateful that a switch of the oven knobs was all it took to convince me of the reality of magick!

-- Some memories of Ebony, Frater Faustus

Multidimensional Magick

Later, the Tesseract approach was extended to become the rebranded flavour known as Multidimensional Magic, as described in this document. Some excerpts:

We used to call the Multidimensional Magick section Tesseract Magick, after the first of the major innovations in Magick developed by Hawk & Jackal. Since then we have begun doing work in dimensions beyond the fourth.

On the overall effect:

There are phenomenon that we should warn you of. Time will sometimes be perceived in a different way immediately before, during, or after a Tesseract.

The effect can be sudden shifts in time or space. Driving a hundred miles in less than 20 minutes. Going through the same stop twice in the same direction on a public transit system. Losing the entire day, someone once skipped their birthday. Distortions in space. Being able to perceive beyond a closed door to the extent that you walk into it. A universe where the sky is red and has green cracks in it. Universes where there is no radio or TV on the air, and there is a smell of ozone in the air (jump again immediately!) People can change eye color, hair color, height, weight, or personality.

Some say that Tesseract jumping is a better version of suicide, and should only be undertaken in the same circumstances. Some say it is habit forming and leads to permanent tourist syndrome toward any universe one finds oneself in.

On jumping and other people:

Only those that jump with you can be counted on. Everyone around you and every social circumstance can change rather dramatically in the most highly vectored jumps.

On post-jump stabilisation:

Usually in a few minutes, though it may sometimes take a few weeks, your new universe begins to harden and become more cohesive. You quit being able to see through walls and time-space distortions become more manageable. Hey don't try to drive until you get used to these effects. Cars have been wrecked. But again lives have been saved as well.

I remember an emergency jump when I was in a car wreck on a skyway, I must have fallen 5 or 6 stories before I felt the jump, and then instantly I was back on the roadway sliding upside down toward the opposite guard rail. I had a broken shoulder but was otherwise all right.

On over-specification:

Don't try to manipulate your new universe too much. Micromanagement can really screw things up. Think about it, what if you tried to consciously control your adrenals or the production of endorphins, or every other hormone or drug made in your body, it can be fun but do you really understand how every thing about how you works.

When you are God, and you are when you create a universe, let the automatic systems function normally unless there is a abiding need to interfere, then be prepared for much more than you predicted.

-- Multidimensional Magick, Fra. 137 [<http://chakraactivation.com/MultidimensionalMagick.pdf>]

TL;DR: I provide links and excerpts from documents which describe an approach called Tesseract or Multidimensional magick for jumping universes.

...

Well, the tesseract process is super long, but it is basically symbolic anyway (of course) - by representing a 4d space to yourself and by intention 'summoning the experience or feeling' of traversing it, you are essentially just accepting that it is possible and allowing it to happen. Belief matters, unfortunately (where "belief"=entrenched habits of your world). The 'mirror technique' is really just an approach of detaching from the mirage of your current surroundings, and so letting the underlying patterns shift. You can be more efficient simply by practicing lying down and completely abandoning yourself and the world, and using assertion. You can choose a nice metaphor (for me it's blankets and folds, or mirages and dunes in the desert, or it can be tesseracts and hypercubes) to represent the 'jumping' to yourself, or you can simply intend new facts into the world. It's basically "releasing a hold on the patterns of the world, and intending-allowing".

EDIT: Of course, there is an effect by which established routes by "others" assist your own changes. So the fact that the tesseract system has been set up will assist your own efforts.

it's easy to see many similarities ...

Yes, it's all the same thing. It has to be, if you think about it. If what we do is based on the truth of the world, then all approaches that produce results must be based on the same principles. I suggest that the main principle could be described as: "decisions and permissions".

I'm inclined to wonder about the relationship here between manifestation and dimensional jumping. Are they really different? ... Prayer, 'The Secret', focused thought-energy...

In truth, I think you can just brush aside all the explanations. Explanations are routes to allowing change, but they are not actually the mechanism of change. Let's just focus instead on what you actually experience. You do a ritual - 'jumping' or 'focussed-thought' or whatever - and subsequently the apparent world seems to change. Say you want a ticket for an important game of Your Favourite Sport and you perform your favourite bit of magick. Two types of result may be possible:

- Maybe the something you want comes to you by an explainable route - a friend rings up and he has a spare ticket for the game because his wife has left him, great!
- Or maybe your world changes in narrative-breaking ways: an object (a ticket for the game!) simply appears out of nowhere; it's just suddenly there on the coffee table. Meanwhile, friends change eye colour and character; geography drifts; the world rebalances.

The only difference between the two is that the second one is an experience that doesn't fit into our usual story about the world. Really, it is simply a shifting of experience in the same way as the first. The latter simply makes it more obvious that there is no solid, fixed underlying to the world. An implication of this is more dramatic: That whatever physical or mental actions you seem to take don't actually matter and have no effect. All that ritual and visualisation means nothing - well, except what you take it to mean. And that's the key. All change occurs by simply deciding-and-allowing. Meanwhile, the apparent world is always seeking to return to a balanced state. Resistance (identification, beliefs, expectations) prevents this. Intending a change in one aspect will naturally result in a realignment of other aspects, because to get any result at all we need to loosen our hold. Actions simply provide an excuse for allowing; it is how you give yourself permission.

TL;DR: The ways things work is always by "decisions and permissions". You don't notice this because you rarely allow yourself to change radically, or decide ambitiously, in a way that will result in dramatic shifts.

Q: TriumphantGeorge, I read your description of Tesseract process: "... by representing a 4d space to yourself and by intention 'summoning the experience or feeling' of traversing it, you are essentially just accepting that it is possible and allowing it to happen. Belief matters, unfortunately (where "belief"=entrenched habits of your world)." This sounds a lot like Neville Goddard's teachings, in which (among others) I've immersed myself over the last couple of years. Do you think? I'll look into this perspective on the technique. (Although there's a point at which all the studying must stop, and Faith must rule.) :)
For sheer inspiration, I recommend Kidest Om. Just putting that out there.

I think that, fundamentally, all successful 'magick' is of the "Neville Goddard style":

- Detach from the current facts and experience.
- Assert new facts (until the corresponding felt-sense arises...)
- Profit!

How you represent the change to yourself doesn't really matter, so long as it involves relaxed detachment and it generates the felt-sense of the new 'reality'.

Although there's a point at which all the studying must stop, and Faith must rule.

Right. Something that happens with those chasing 'the truth' and those chasing reality changes is that... they end up just talking about it. Putting off the doing. And you can understand: implicitly, everyone knows that realising the truth (dreamlike reality with no solid foundation) or changing experience (transforming the dreamform) corresponds to a sort of death. Everyone wants what the want - except most don't, not really.

Kidest Om: New to me, will check.

Q: Hey, I have a question. If I want to intend that, say, I enter a dimension where my favorite video game is finally released, could I also intend-allow that all of my friends have the same personality? I'm actually fine with my entire physical world changing, I just want to be able to have the same friends, and of course, the same me.
Edit: Could I also will that, say, a sentimental object stays the same, but allow everything else to change?

I think that making the firm decision (and fully accepting it) is enough. After all, this is what you are doing in daily life anyway. Holding onto some things, letting other things unravel and change. With this approach, you are just letting go of more. Perhaps to make it easier, you could try imagining it in a slightly different way. Rather than imaging jumping dimension via a leap into the void, imagine that right now there are two paths. The left-hand path, no game. The right-hand path, in a short while there will be some new information that shows all is well. The rest of the universe remains untouched. Get into the right frame of mind. Step onto the right-hand path. Meanwhile, I'll be so disappointed if The Last Guardian really is not happening. Because The Shadow of the Colossus is my favourite game of all time.

I'm making the firm decision that The Last Guardian is in fact coming out to store shelves in a month.

Yeah, but you know what'll happen don't you? Magick has a habit of taking your requests literally. So you better be very specific in your phrasing.

For example:

YOU: "I want The Last Guardian to be on store shelves in a month!"

UNIVERSE: In a shocking development, The Guardian newspaper goes into bankruptcy, publishing its last edition one month later.

Q: I wonder if I could make a servitor to automatically re-define the intent of my spells based around its context...

An intermediary usually solves the problem. Actually, what usually happens is that all relevant meanings arise!

DimensionalJumping Misc Posts

Sleep Out Of Jail Free

...

Q: I had something like this happen way before i ever heard of dimensional jumping. I was living in Reynosa, Mexico and there was a shootout. I was in my car a block away stealing wifi, and all of a sudden bam, Full on machine gun fire, but no RPGs or anything like that. Was a couple blocks away. Was over by the time I got home to take cover. Had to stay inside and keep low for a few hours because we didnt really want to deal with the federal police searching our house and stuff. There were apache helicopters flying overhead and the army driving around and shit. My girlfriend still says that all really happened, even though it wasnt in the dimension we are currently in. Supposedly the following is a dream. For the next week, there were daily shootouts. We were pretty much hiding in the house constantly only going out when neccessary to get some food. Ratatatatatatatatatatatata a couple times a day. Was pretty scary. There was a concrete wall on both sides of our house and it was way back off the road behind another building, and the machine guns would make this epic echo.... Then i woke up and it was just a couple hours after the first shootout. Was it reallllly just a dream? it felt so real...

Interesting! To, to be clear, is it that:

- You and your girlfriend both experienced the first shoot-out.
- The subsequent week of daily shoot-outs seems to be a dream you then had.
- But even the first shootout wasn't real as far as your current dimension says, even though your girlfriend agrees with you that it did happen.

The first and second points are true, but the third was wrong. The first shootout was definitely real.

Ah, right. So, the first shoot-out is real, then you experienced a week of shoot-outs but wake up - meanwhile, your girlfriend says there was only the first shoot-out. Must be disorientating to wake up from that!

It DEFINITELY was disorientating. And my girlfriend has had dreams that lasted for months before, I never did until this. A lot of strange things started happening to me a couple of months before I met her too....lol

Ha, sounds like your girlfriend is literally a pixie dream girl! :-)
Don't let her wake up, or you won't have existed... ;-)

Aww.....What's a pixie dream girl?

It's become an abused TV trope now but originally it was a romantic character who was quirky and other-worldly "like a real-life fairy".

Relevant Experiment: Facts Are Now

Redditor /u/UniversalChairs has submitted a post elsewhere linking to a recent study of the Wheeler Delayed Choice experiment:

To put it very simply, a particle (in this case an atom that has the physical properties of weight and mass) can behave either as a discrete particle or as a wave ... this experiment proves that whether the atom behaved as either a particle or a wave can be decided after the fact.

What it really means is that, in effect, the atom didn't behave one way or the other at the time. However, the observations you make later decide if reality will behave "as if" it had. What's the relevance to dimension jumping?

Well, it highlights that what really matters here is what you experience as true, now. Directed jumping involves detaching from the current observation while intending, or "asserting", that a new situation is true. Asserting a new fact in this way is like creating a fake observation, such that subsequent experiences will be "as if" it were true. The insight that comes from this: imagined experiences are of the same form as sensory experiences and, if intense enough, have the same weight (create a memory in the universe as fact) as sensory experience. See the Imagination Room metaphor as an illustration. You can read my full take on this in my comment to the main post (it's worth reading the rest of the discussions also). The key observation I make:

The only rule is that the apparent world remains self-consistent as an entire pattern.

If an "observation" is made, the apparent world will appear consistent with the observation from that point onwards. In this subreddit, we suggest that both sensory experiences and imagined experiences count as "contributing observations", differing only in their intensity.

...

You could possibly send yourself into a hefty delusion if you dissociated successfully and heavily too many times.

I say we are mostly safe because the "world-pattern" remains a unified whole, it's just that tugging too hard on one part obviously involves indirectly shifting the rest of it. However, whatever you fully intend - or imply with your intention - is guaranteed to produce an experience of some sort, even if it's just lots of thoughts or a dream about it. You could end up with a half-magical, half mundane experience. After all, it's perfectly possible to dream that you are insane. So...

Do you think this is why people say not to jump too often or too "far"?

What's important is that you don't intend conflicting things - adopt a single metaphor and stick with it. If you view it as "swapping dimensions through a mirror", stick to that. If you view it as "updating your dream", stick to that. And then let it go. In my opinion, we want to stay with a really streamlined "technical" metaphor that doesn't imply much else. e.g. If you start thinking there are "other you's" that you swap places with, you might imply to yourself that these others really exist and might linger or cause problems, that you might not fully switch, etc. And you will have experiences that are consistent with these thoughts. So keep it simple, keep it focused, don't think about it too much: What you are doing is literally "giving yourself a new observation", one which implies facts of the world via the metaphor. I've linked this before, but the Dream Views article on persistent realms is worth a read, because it illustrates how creation-by-implication works (albeit in a more flexible starting environment.)

EDIT: Added some extra sentences because I was in writerly mood! :-)

Q: A summary please?

For the main takeaways, just read the quotes in the post - but for the experiment, it amounts to (very loosely speaking):

- Passing a helium atom through a "switch" and then to a detector.
- The "switch" is such that it can correspond to the helium atom being a wave, or a particle.
- But the switch is randomised after the the atom passes through it.
- This means that the "wave or particle?" result depends on the measurement, and not the switch.

In other words, "wave" or "particle" are properties which belong to the observation and not the atom. It's a bit like discovering that the brightness of the sun really is a property of which pair of sunglasses you are wearing, and not the sun itself.

TL;DR: The world is your accumulated observations of it. The world itself has no inherent properties.

Q: So the Fiction- is as real as we'd make it (ish), this sounds a lot like romance

Well, if I was blueprinting a universe, I'd definitely have a healthy dose of romance built-in!

The Buddha Makes A Jump

From an article over at Science and Nonduality

We may read about the “emptiness” of reality and be perplexed by what this means from a conventional perspective. However, in the context of an interdependent co-arising universe, the fullness of one moment vanishes completely only to be replaced by the fullness of the next instant of manifestation. All that existed in the preceding moment disappears completely so all things are truly empty of an enduring, physical existence. This is a subtle and foundational insight for a wise relationship with the complete dynamism of reality.
--The Buddha Awakening, Science and Nonduality

Okay, this is a bit of a different angle, but if you are interested in such things then Buddhism has quite a nice description of how "reality" dissolves and is recreated every moment. This provides a way of thinking how dramatic changes can occur in your experience almost instantly: the continuity of experience is something that you do; it's not a property of the universe itself necessarily. By letting go of that continuity, with an intention in mind, we can jump more directly to our desired situation than would otherwise be possible using a "stepwise" approach.

Recommend reading the article in full for the quotes, if this is your kinda thing.

Constantine Dimension Jumping

Last week's episode of Constantine - an excellent TV series based on the Hellblazer character John Constantine - had a storyline about alternative dimensions accessed by candles and reflective surfaces. And a great character called Ritchie who had certain inter-dimensional benefits, having studied the "principles of other planes"...

Spoiler-filled recap here. [<https://collider.com/constantine-recap-season-1-episode-11/>]

Hopefully your own jumps will be less... traumatic.

An Empty Dimension

It's gone rather quiet on this sub.

Is that because 974 subscribers have now successfully jumped to alternate dimensions? Only I am left.

Technically, there should be one final post from a subscriber in each destination dimension, documenting that subscriber's success after landing in that dimension. But there isn't one on this sub. Is that because this dimension isn't desirable to anyone, so nobody has jumped here?

I am sat alone, in the dimension all the other dimensions have nicknamed 'the Departure Lounge'...

A Line Of Thought

I've been looking for simpler ways to describe the essentials of The Patterning of Experience, ways that don't require too much background. The core insight of course remains that "what we are" is a conscious space or perspective. Beyond this, though, it's how to describe content and change in a way that's practically useful. This bullet-point summary was part of an experiment for getting people to move their bodies effortlessly (streamlining the Alexander Technique), visualise more easily (summon rather than create), and provide an intuitive way of thinking about generating deliberate synchronicity. Posting it here in case others find it of use.

We recall things into existence.

A line of thought...

- The world is just a line of thought, albeit a bright and stable and immersive one.
- The world has no depth.
- Dissolved into the background space are all possible forms and relationships. It’s like a toy box filled with pre-made shapes and layouts, objects and containers.
- To bring them into worldly existence, we merely have to recall them.
- To recall them is to superimpose those patterns upon current experience. They are incorporated and “manifest” wherever context permits.
- The more specific we are with our recall, the more narrowly defined the context. (For instance, we might incorporate a timeframe or location or circumstance, and manifestation would be constrained appropriately.)

**Manifestation vs synchronicity...*

- An ‘intention’ is simply the name for a pattern which we want to see incorporated into our life.
- It can be non-sensory, since it can be the overall felt-sense of the pattern, without it necessarily being expanded into the sensory.
- What separates an intention from recall is the introduction of a specific spatial and temporal context plus, typically, a subjective viewpoint.
- This marks the difference between experiencing manifestation (including body movements, thoughts, “results”) and synchronicity (the appearance of the same patten across unrelated situations).
- If you can recall (conceive of) something, you can experience it.

See also this related comment below: All Thoughts Are Facts

...

An alternative formulation of the same thing, for those who like to envisage the nature of a persistent state of all logical possibilities which is being modified by re-emphasis:

All Thoughts Are Facts

On using the world-as-thought perspective as a way to create deliberate synchronicity and therefore particular scenes:

- You are an "open conscious space" in which thoughts arise. The apparent world is basically a very bright, stable, full 3D-sensory immersive strand of thought.
- The world evolves by the accumulation of observations or "facts".
- Every thought you have about the world is literally adding a new fact to the world.
- Thoughts which randomly arise simply reveal the current state of the world.
- If you deliberately think a thought, then you are deliberately adding a new fact to the world. (This is how to make changes.)
- The more intense the thought, the stronger the influence of that “fact” upon your experience.
- If you respond emotionally to a random thought, then you are in effect re-thinking it as a more intense thought, meaning it will contribute more. (Hence fearful thoughts tend to increase the prevalence of fear-related experiences; however this works just as well for nice-emotion thoughts.)
- If you “grasp” onto a thought then you are persisting it - you are maintaining it at its present level of intensity and not letting it fade and be “forgotten”.

Things such as detachment, surrender, abandoning yourself, and so on, are all about letting the current dominant thoughts or “facts” become softer and fade, letting the world shift freely, and allowing other thoughts to shift into prominence.

...

For the world having no depth, /u/Utthana just summarised this nicely:

There's no objective reality hiding behind your experiences just waiting to be experienced. It manifests when, and only when, it's experienced.

For the context aspect: it's that things will usually arise in circumstances which "make sense" according to your expectations. The looser your acceptance of the world, the broader the definition of acceptable context becomes. In terms of intention being non-sensory: the felt-sense is that "global meaning feeling" associated with things. For instance, when you decide to win an arm wrestle (silly example) then you may or may not have a visual-auditory-textural visualisation arise for that, but the "unpacked felt-meaning" of that instead.

Additional: For what you are trying to so, you basically want to: not do it. You want to recall the target state while forgetting the start state. Just as when you get out of a chair, you should do so by recalling the state of being stood up without first re-remembering sitting or moving in stages (let experience flow "by itself" towards the shape of standing). As a general help, you might find it useful to recall the experience of being a completely open, unfilled space. Remember that the "memory" already exists, you are just bringing it unto sensory experience.

Q1: As a general help, you might find it useful to recall the experience of being a completely open, unfilled space. Remember that the "memory" already exists, you are just bringing it unto sensory experience.
Interestingly enough, I actually have a conventional memory of being an open space, in which I almost immediately found (created) the feeling of self. I used to think about it like a memory from the womb or something.

Interestingly enough #2, there was a recent thread about childhood memories of "experiencing nothingness".

[QUOTE]

POST: Did you ever experience nothingness as a child? Pure empty space? (/r/Glitch_in_the_Matrix)

Q1: When I was a kid ; six or eight or so, I was prone to ear infections, and when I went to bed at night my ears would ring incessantly until one night the noise stopped all at once, and in its place came a flood of emptiness; a vast emptiness that threatened to swallow me from the inside. I screamed, and ran to my parents' room, probably terrifying them. It happened again the next night and the next, until I stopped being afraid and started paying attention, and that's when I realized that what was filling my head every night wasn't nothing; it was everything. For whatever reason the universe, every galaxy, every star, and all the seemingly empty expanses in between, everything had chosen to pack itself into my mind, and it very nearly drove me mad until I learned to stop fighting it and just embraced it as it was - an infinity resting between my ears for a while. I wish I could tell you that the universe and I became friends after that, but the universe doesn't make friends. I am no longer afraid of the void at least.

Q2: yes! I've had the same exact experience when I was kid when I'd think about the afterlife. I'd just think about what if we just become nothingness, then I'd visualize pitch blackness and feel really strange after I snapped out of it.

*Q3: I experienced it 2 years ago. I kid you not, it was the most blissful experience I have ever felt. In the void you understand **you are nothing and you are everything**.*

[END OF QUOTE]

Some interestingly seem to be "further into the background" than others. I haven't nailed why latency is variable yet. Thoughts?

I think of it as being that their "amplitude" has faded over time and so they need some more "summoning" - in much the same way as a distance memory may take a little allowing in order to have it come back to full strength.

I'm not entirely sure what you're trying to convey with "wherever context permits", but theoretically, any experience can be instantly manifested anywhere, in any way.

Agreed - but if you specify a time and location, for instance, then you have deliberately narrowed the context. The notion of "context" here is pretty open, see the little example I've attached below. Context is also about the association a situation brings, and so on. (EDIT: I've added an extra sentence to my post to make this clearer; thanks for highlighting the ambiguity.)

Non-sensory is far easier for most people, I suspect. Might not have been a few hundred years ago, but is now.

It is. Which is a problem when combined with the "only visual-auditory-texture is real" as their assumptions, because they don't understands they are making changes, or they try to "experience themselves doing" which can get in the way. And yes, it's interesting that "to concieve" is associated both with giving birth, creation, and with ideas and notions. (For instance.) And when you give birth, you are doing so to something that already exists - you are just bringing it into "the world". That word alone tells us pretty much all we need to know it seems!

Owl & Screen Metaphor

You draw a picture of an owl on your TV screen. It is always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day. Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

Q2: *An ‘intention’ is simply the name for a pattern which we want to see incorporated into our life. Interesting, so do you think our ability to be able to name it (whatever we're recalling) is of much importance then? At the very least I'd imagine it'd help. I'm thinking though that there are a plethora of minute or subtle experiences, or even distant ones (in a sense of compatibility with our current pattern we're in) that we don't have a name for. How do we go about recalling those ones?*

I think naming helps, because a name or word is inherently part of the pattern it 'represents' and triggers it. (If it didn't trigger, you wouldn't know it, because to know it is to experience it, at least at low intensity.)

If you can conceive of it, you've party recalled it. If you can't conceive of it, it doesn't exist for you anyway?

Rick Archer interviews Rupert Spira

Buddha at the Gas Pump: Video/Podcast 259. Rupert Spira, 2nd Interview [<http://batgap.com/rupert-spira-2nd-interview/>]

I found this to be an interesting conversation over at Buddha at the Gas Pump (a series of podcasts and conversations on states of consciousness) between Rick Archer and Rupert Spira about direct experiencing of the nature of self and reality, full of hints and good guidance for directing your own investigation into 'how things are right now'. Archer continually drifts into conceptual or metaphysical areas, and Spira keeps bringing him back to what is being directly experienced right now, trying to make him actually see the situation rather than just talk about it. It's a fascinating illustration of how hard it can be to communicate this understanding, to get people to sense-directly rather than think-about.

I think this tendency to think-about is actually a distraction technique used by the skeptical mind, similar to what /u/cosmicprankster420 mentions here [*POST: The depths of the skeptical mind.*]. Our natural instinct seems to be to fight against having our attention settle down to our true nature.

Overcoming this - or ceasing resisting this tendency to distraction - is needed if you are to truly settle and perceive the dream-like aspects of waking life and become free of the conceptual frameworks, the memory traces and forms that arbitrarily shape or in-form your moment by moment world in an ongoing loop.

His most important point as I see it is that letting go of thought and body isn't what it's about, it's letting go of controlling your attention that makes the difference. Since most people don't realise they are controlling their attention (and that attention, freed, will automatically do the appropriate thing without intervention) simply noticing this can mean a step change for their progress.

Also worth a read is the transcript of Spira's talk at the Science and Nonduality Conference 2014 [https://web.archive.org/web/20180312044814/http://non-duality.rupertspira.com/read/the_new_science_of_consciousness]. Rick Archer's earlier interview with Spira is here [<http://batgap.com/rupert-spira/>], but this is slightly more of an interview than a investigative conversation.

...

Q: *I think this tendency to think-about is actually a distraction technique used by the skeptical mind This is exactly what I was and have been battling with this past year. Getting the skeptical mind (ego?) to stop worrying about things that don't matter and start allowing things to flow naturally. Whenever the flow starts my skeptical mind kicks in and blocks it immediately. Very frustrating. There's something you should try: Make sure your attention/focus/presence isn't centred on your head/neck area. That's where tension and resistance and fight-flight tends to kick in, plus the upper chest. Instead, try to start with a pretty open,wide attention, lightly centred on your abdomen. Then when you get a "reactive kick" it won't have quite so strong an effect. Another thing that can happen is that we keep "checking" or at least slightly holding on to ourselves. Working towards an attitude of full commitment/abandonment is the way forward.*

Of course, all easier said than done, because it's a wee bit scary. :-)

I'll have to work on that. Moving my presence anywhere but in my head is pretty difficult.

Yeah, you can't do it. Rather than move it, maybe it's better to say expand it - to reach down further into your body. You'll be tempted initially to try and do this muscularly somehow but a bit of practice and you're good.

Sorry, hard to describe!

Makes perfect sense. My last two telekinesis sessions have lined up perfectly in the timing of your comment to emphasize your point. Interesting how the universe functions. I will expand on that idea. No pun intended. I have noticed that I have to do some muscular work before I can settle into a mind space that allows me to feel, sense, experience the sensation of physically making contact with my wheel and getting it to turn. It took me a full hour to get into that mind space most recently. About five or so months ago I could get int that space within the moment of sitting down to practice. I really had a bad time a couple months ago and it set me back. Now I'm working to rebuild what I once had though I do feel as though my progress is better than it was before though I need to regain the control.

Well, the universe moves all at once - it's sneaky like that. What prep do you do? Is it all concentrating, or do you a 'releasing' exercise beforehand to get rid of the day's debris?

I have begun doing a chakra prime and then grounding and aura charge before proceeding. The reason why is because I drained myself to the point of depression around October last year. I am trying to make sure that I am always filled with external energy. The chakra priming is done by expanding awareness and then absorbing energy and then pressurizing all the extra energy into a chakra. I do that twice per chakra because that tends to allow me greater sensitivity of my chakras. Then I sit for however long I feel I need and meditate until I start feeling a disconnect from my body and my focus can be at its greatest.

If it works for you, sounds good. I didn't really spend much time exploring that side. Perhaps just lack of dedication. :-) Although I have experimented with localised body areas (different areas of the "brain area", etc) not really anything more formal.

But also it felt like "effort" and, knowing I was already operating from a tense background, I figured I'd try and get to the most open, relaxed starting point I could. I began doing a 2 x 10 minute daily releasing exercise (lie down, let go completely and absolutely, let mind and body and attention move as they want) and then mixing that with something more active (latest post is on that [*Overwriting Yourself*]). The final idea being that, if I hit a base state, then intention would naturally call upon the appropriate approach; the routes of "manifestation" would be more flexible, as it were.

I feel that in the end all the same things get tackled no matter what the approach though. You'll usually get drawn to the next thing, the right thing, if you're paying attention to your progress.

...

*Q: Has Spira realized he has a free will yet? Or is he still droning on and on about choicelessness?
and that attention, freed, will automatically do the appropriate thing without intervention
Not necessarily! If ordinary untrained people stop controlling their attention, their attention will simply drift toward the status quo, which will not be a good outcome.
Effortlessness is only a workable option for highly realized beings. Everyone else has to uproot bad habits through some amount of effort, and yes, control of attention.*

I disagree that untrained people's attention drifts to the status quo. What it actually does is constantly jump and attach itself to sources of pain that need resolved, so they wilfully choose distractions. It keeps moving! That's why people have to really concentrate on tasks, because they've got a backlog of things their attention wants to... attend to and release.

Precisely. That's what I meant by status quo. This kind of choppy experience is habituated into the mind and is effortless actually. So without effort, this choppy flighty back and forth is what you get as someone under the influence of materialism and its attendant concerns for the body, social acceptance, etc.

No, it is very effortful - the effort of avoidance. It's subtle, but always there. If you truly give up, then it settles out after your "stuck thoughts and incomplete movements" resolve themselves.

If what you say were true, then stopping would be easy and natural and then everyone could become liberated in one afternoon reliably, like a machine.

It's not easy, because it can be quite unpleasant, and it's also transparent - people don't realise they are compulsively forcing their attention (deliberately contracting and deforming themselves) or compulsively creating distractions, because the thing with avoidance is you often don't know you are avoiding. And the thing with effort is that if it's constant, your can be quite unaware of it - until you stop. "Seeing the nature of things", I can give you right now. Unravelling your accumulated patterns, wide open attention that never shifts? Longer. There's nothing to be done about it, but you do need the courage to do nothing. People will find any excuse to avoid doing, say, a daily releasing exercise that involves simply lying on the floor - because they know things will come up. And they'll feel fear. Letting go completely is required in order to retrieve your power, but everything you've ever run away from will be waiting for you when you do and will hit you if you hold back even a little bit.

If this deformation required effort, they'd notice! They don't notice it because it's effortless.

You're wrong. Habitual effort becomes the normal background. Clench your fist for an hour and you'll not longer notice it. Try to open your fist subsequently and you'll feel pain; it'll be easier to stay clenched. If you instead let your fist go, stop holding onto it, then it'll gradually release.

That's one way. I call that non-conceptual relaxation. The thing is to practice non-conceptual relaxation you need to be highly realized already and you have to understand how it's different from ordinary relaxation.

There's nothing to understand. Just stop messing with your attention (although realising you are controlling your attention is subtle; however, that is what 'realisation' actually is). Yes, minor movement is helpful - Tai Chi, for instance - mainly because it sneakily expands your attention to fill out the body space and beyond. It's actually a theraputic technique: drawing attention from the head-space and other locations, into the body. Lots of "character conditions" are effectively localised attention. (I found some good info and techniques in The Psychology of the Body, Elliot Greene, which is written for massage therapists. Worked well.)

However, still, these - like Alexander Technique "instructions" - are basically cheats for getting you or someone else to expand (or rather, cease contracting) your spatial awareness. Because for most people, telling them to do that directly wouldn't make any sense to them. It's a metaphorical fist, you get the idea: opposite action does not dissolve or undo the original action.

You don't really understand the nature of habit

Habits are memory traces in "mind", and persist unless you allow them to release via recognition and acceptance, or you overwrite them. You don't need effort, just intention. What form could effort possibly take? What is effort made from? Every object in this room is a habit.

This makes no sense. Volition isn't separate from my being and neither is attention which is a partial function of volition. I can't stop it anymore than the Space can stop allowing objects through it.

How does it make no sense? People interfere with their attention in an attempt to manipulate themselves instead of simply intending, just as they tense their muscles in order to move when they could simply direct themselves in a more general sense and let the correct movement happen.

To interfere with your attention you have to be as though outside your own attention. Attention must be alien to you. There must be a separation between you and attention.

Ah, this where we're going wrong. I'm assuming we're talking from the point of view of the background already, not a "person". Effort is imaginary, from my view. Or better: it is the experience of intending something contrary to the existing momentum. You don't do effort, it's a sensation you have.

It's much easier to just go to the doctor and fix a tooth

Easier still, the dentist! But why did you have the problem in the first place?

There is no separation between me and attention, or me and that table. Attention is a subtle object, a deformation.

For example, you walk at night and there is a scary noise. The easy thing to do is turn away and go the other way. What takes EFFORT is to NOT turn away, but keep going even though that's not what you'd rather do. So you push yourself into a situation that's unpleasant. That's the necessary effort. And even yet, even in the middle of all this, has there real effort been made? No! The whole process is effortless in just the manner you say. Effort is just a sensation. There is only effortless intent. You decided effortlessly not to be a coward and followed through, like a star flying through space, without effort. But on a human level this is known as effort.

An imaginary hammer might seem to hit an imaginary nail, but it builds towards nothing. "Effort is a sensation" - yes, it's actually the sensation of resistance, of existing established patterns, rather than the sensation of doing or overcoming. Attention is an object, it has shape and is relative. It is regularly removed, as in dissolves into the background. Most people fall asleep at that point.

...

He doesn't touch "first cause", but without it you can't release state into choiceless awareness in the first place. Initial understanding comes from a brief cessation of creation. At which point, interfering is optional, you can just let momentum roll, or create consciously.

This is maybe more your bag: [<http://www.nonduality.com/dep.htm>]

I prefer this: [http://lirs.ru/do/lanka_eng/lanka-nondiacritical.htm]

TL;DR? It's Friday night.

That won't do it justice. It's better to just ignore it, the same way I ignore your link. :)

Ha, you'd like that link; it's all about being God. With no tricky Indian words whatsoever! ;-)

I'm a little bit like Spira in that when talking about this I prefer that we both use our own words. The only time I use links is usually if a) I don't have the time to discuss it properly, or b) I am arguing with a dogmatic Buddhist who needs an authoritative source, and then I'll give them a link to the doctrine. But the best way to talk is directly, from our own person, based on our own understanding and experience.

Quite so. The limits of text, here, however can be a bit of a restriction. The interview highlights the battle involved and the value of in-person dialogue, the persistence of deep assumptions. Talking in person is always a "feeling out" which is quite difficult to replicate in other modes. Why when it is so obvious are people resistant to the truth? Because it is not obvious, and in fact plainly wrong, to them.

Q: You know, I think Spira does say a lot of really helpful things. But I'll never forgive him for talking about choicelessness, because he's actually ignoring a very important aspect of experience, which is volition. I am guessing he sees volition in purely negative terms and wants to eliminate it. He doesn't see that volition can also be liberative and skillful and be the cause of liberation rather than an obstacle on the way to it.

Talking in person is always a "feeling out" which is quite difficult to replicate in other modes.

Maybe. I like text almost as much as I like to talk in person. But I do like to talk in a format where we can quickly exchange information. So for example, if I really wanted to talk, I'd prefer IRC to this, because IRC is much more immediate in terms of my ability to respond.

Why when it is so obvious are people resistant to the truth? Because it is not obvious, and in fact plainly wrong, to them.

What's obvious to them is that they are a body, and that body must be kept alive, and to keep it alive, they need to remain in good social standing, among all other things.

I think you misunderstand the choicessless awareness thing - or I place a limit on it. One or the other. Anyway, I see it as you can experience choosing and doing but you aren't actually controlling it (that's theatre), but we do have free will but at the very base level of being: we can change the shape of ourselves by ourselves, reform our experience directly at the root. That's not choosing or willing, that's becoming. Yeah, everyday people quite like breathing and stuff. But also, the concepts you inheret you tend to literally experience as true in your dream-world. It pre-informs the partitioning of experience into content. That's why magickal traditions focus on belief adoption or belief circumvention.

It's willing and choosing. You just don't get it. That deep level is always operative and is never absent.

It's momentum and occasional intervention. Our pal Neville had that susses: Deterministic paths occasionally re-directed by conscious overwriting.

You shouldn't talk about will as though it's distant from you or not at the very core of your being.

Not at the core. What we call "Will" just is your being changing shape. Willing implies there's a "you" and a "target", when that's not the case at all (except conceptually, when thinking-about).

Otherwise it may seem crazy to change your beliefs and unjustified.

But of course, our beliefs are all around us, so that (once understood) is justification enough.

Q: It's momentum and occasional intervention. Our pal Neville had that susses: Deterministic paths occasionally re-directed by conscious overwriting.

I don't buy it. That's not how my will functions at all. The closest I get to determinism is habit, but habit isn't 100% deterministic for one, and two, occasionally because volition is after all global, a huge shift happens that's not just a minor adjustment.

Willing implies there's a "you" and a "target",

Absolutely not! That's where you go wrong. It doesn't imply that at all. That's just how you conceptualize your will right now. Eventually you'll see that's not true, because volition completely transcends personal identity. That's why I keep saying you aren't really George, just play one on TV. And I do mean YOU, so in some sense there is a person, but it's not the kind of person you think. Not necessarily a human and not even necessarily a social person, but still a person with choices to make.

I think you are too focussed on Will as "continuous manipulation", or that's how it seems. How tiring and effortful! Take a step back and see the imagery of the moment unfold, and as the play proceeds, give occasional directorial instructions. The focus is on enjoyment, and occasional enhancement. (This is choicelessness + creation.) Kick off the domino sequence, put your finger in the way if you want it to topple elsewhere. A power that requires constant maintenance, moment by moment effortful re-creation, is no power at all. Will as you describe it does imply separation and strain. Grasping. Fighting. Desperation. Personal identity is an occasional thought plus a persistent sensation. Both are just "object content" within experience.

What do you mean by "too"? Like overly? Who is the judge? On what basis is such a judgement delivered?

I am the judge! :-)

My thinking about will is so different from yours that you should not make any assumptions about my will based on yours. So don't say my way is effortful.

That's how you make it sound! Exactly as if you are trying to overcome something. Destroy something and overcome something. But there are no such things. Perhaps it is just your phrasing. So, I don't see volition as effort at all, simply a decision, a seeding and a redirecting.

You're not powerful enough. You're like a flea on my back George. You telling me to stop or do this or that is lunacy. You can keep doing it if it pleases you, but I see all such effort on your part as something akin to spitting at the moon or batting at the space. It's pointless. You have no authority or charisma in my mind. So the only way you could get inside is through a good argument. If you don't have a good argument, you really don't have any other open pathway.

Hmm. I think you misunderstand the understanding that I am assuming. It is you who are speaking from a partial personal perspective.

Of course I am speaking from my perspective, which like all perspectives has to be partial due to its exclusionary quality. I never deny this.

The key word was "personal". That is your error. You are still identified, still fighting the world, keeping it separate, but not realising.

Making a distinction between personal or other kinds of perspectives is pointless.

It is vital in terms of communication, the context changes the meaning. How can you fight your own habits? They are you. You can change and become, but you can't fight yourself - that implies and persists the same patterns. Fighting recreates the foe. And if you are fighting yourself, you are fighting the world. The world is just a mirage arising from the contours of your own memory traces, your own habitual structure, as subtle patterns in awareness. Freedom is the ability to change one's shape, to shift one's contours, to temporary or ongoing effect; there is no other freedom.

For example...

Seems like rather a long way round. Why don't you just change the subtle underlying pattern directly

If you see the world as being an internal image that's true

Where is "internal"?

"Freedom is the ability to change one's shape, to shift one's contours, to temporary or ongoing effect; there is no other freedom." Of course.

This is fundamental. There is "what is the nature of experience" (patterns in and of awareness) and this (how the patterns and so the world can be changed). When changing one's shape, one might feel resistance and call this "effort", but that is a sign of the stability or depth of an existing pattern, coupled with your identification with it.

What's directly and what's indirectly? I don't know how to make a distinction like that. On the basis of what is such a distinction made?

You're talking about messing around with the mirage; just change the landscape! It's like trying to change the movie by drawing on the screen or talking over the soundtrack. Just update the script!

To create or amend habits by generating experiences, thereby leaving trace memories, is the long way round. Just change the traces. On effort: it's not a good thing, or not. One shouldn't aim to create the experience of effort particularly; it's just a byproduct.

The thing is I am the director and the actor. I can't just change the script. I have to then read the new script, memorize it, and learn to act it properly to my own satisfaction. This isn't a lazy process.

Nope, you are the whole production. You don't need to do any of that, just adopt the new form. Change your nature, see it unfold.

It's not long. In fact, being in a hurry is the long way around. Where's your patience? I am ready to do this for 10 aeons.

That's your choice, so that's what you'll get. You've chosen that story! Think I'll enjoy my more straight-for-the-goodies fun.

Nobody makes effort for effort's sake, jeez. But if you say effort is a byproduct, you're saying it's not important to focus on it in your attention at all, ever. That I disagree with.

People do exactly that all the time, thinking effort is causal. Why focus on effort at all? Attend to the desired form, that's it.

Because when one attends to the desired form, there is resistance in the form of fear, habit, etc.

So what? Just accept that and continue. If you want to remember things, insert that fact directly. It's a good example, and does work.

...

TriumphantGeorge, a question: in that article it is implored that we cease the will of creation for a moment. How does one do this?

Edit: Daily releasing exercise / meditation?

Edit again, nvm I feel like I've got it.

Yeah, just... stop.

Intersubjectivity

Intersubjectivity is a key term used in philosophy, psychology, sociology, and anthropology to conceptualize the psychological relation between people. It is usually used in contrast to solipsistic individual experience, emphasizing our inherently social being.

In our own dreams, the whole dream is 'us' and our intentions manifest fairly directly (although there are cases where strange things do happen); we are 'sole creator'. The experience is of being a 'dream space' but identifying with a 'dream character' who acts as the perspective centre.

In waking life, although our personal experience is identical upon examination ('awareness space' with content arising in it and identifying with a perspective character), the world tends to be less obviously flexible and we assume that there are other 'people' sharing the world with us - who themselves are experiencing an 'awareness space' with content arising within it.

The only observable difference between waking and dreaming is really the sluggishness of the environment in response to our intentions, the rest is imagined. But I still find the 'multiple perspectives' thing quite tricky to get a handle on. Sure, I know that I am not a person, I'm a 'space with an imagined dream character', and in that sense on equal footing with the other people I encounter (avatars?), but I've yet to come up with a really satisfactory way of thinking about this.

Any ideas?

(Non-duality writer Greg Goode brings up this issue in a presentation on Common Stumbling Blocks to Non-Dual Realisation which is worth a read, here. [<http://heartofnow.com/files/images/greg.talk.conference.pdf>])

EDIT: The discussion below has also expanded into notions of intention and free will, and the implications of this for intersubjectivity.

...

Hmm, I'll need to think about that a little; seems interesting.

Our expectations are internal to our being, they're not something we can look at the way we look at chairs.

No, but the world we experience does reflect our internal expectations and biases - we live ourselves through our 'external' happenings?

Q: The only observable difference between waking and dreaming is really the sluggishness of the environment in response to our intentions, the rest is imagined. I think that's true in general, but I've had lucid dreams where I was certain I was dreaming, but I still couldn't manipulate squat for the life of me. I haven't had many such dreams, but I've had at least two or three or so. The biggest difference between lucid dreams and ordinary waking is our expectations, I think. We expect different things from dreams. This isn't observable in the environment per se. Our expectations are internal to our being, they're not something we can look at the way we look at chairs. But I still find the 'multiple perspectives' thing quite tricky to get a handle on. Sure, I know that I am not a person, I'm a 'space with an imagined dream character', and in that sense on equal footing with the other people I encounter (avatars?), but I've yet to come up with a really satisfactory way of thinking about this. I explain this via subjective convergence and divergence. Because subjectivity is just a point of view, these points of views have the same flexibility that mathematical points do. They can converge and diverge arbitrarily. I want to note I am only comparing flexibility of relations here. I'm not saying subjectivity is a mathematical point.

Yes, that's why I included "although there are cases where strange things do happen". Sometimes you encounter other characters who seem stubbornly like 'other people' rather than part of your dream, for instance. One possibility is that, although in general your dreams are 'seeded from scratch' - they are fresh and borne in a new 'space' - this is not always the case. Sometimes you are joining as a perspective in a pre-existing environment. Like connecting to an online gaming experience. This raises the extra question: If we are a 'space', when we dream are we connecting to existing 'mind-realms' and sometimes seeding them, and why are we apparently by default connected to this particular 'waking' one?

(Robert Munroe, the OOBEGuy, in later books starts connecting to other worlds - he thinks - to the extent where he revisits the same place and 'person perspective' later, and finds that their lives have moved on as if they were still playing out in his absence; the worlds are persistent and independent, apparently.)

But intent is a powerful thing. If you think you are connecting, it will manifest just that. So in effect, you might as well be connecting if you really believe you are. So there is that too.

There is that. That's the thing: expectation is pretty powerful, and hard to disentangle. And expectations often seem "obvious".

To me expectations are the most devious things ever. I often discover expectations when I didn't think I had any, at the least opportune moment usually. I certainly have hidden, subconscious or maybe even unconscious expectations that I haven't unearthed yet. I am pretty sure of that. They're sneaky as hell and they hide very well in the background of my mind where I can't find them easily.

They act as filters, sometimes dangerously so. Sometimes it just won't occur to you to do something important because of your expectation that it isn't possible, or it simply isn't included in your worldview. For instance, I am really interested in the 'making decisions' process, because I think I actually didn't really make decisions for the first chunk of my life; rather, I experienced sequences of thoughts. I wasn't intending to change course. This didn't matter, until 'environmental events' derailed one particular project

because I didn't keep on track, and I didn't really know how to maintain it.

It's important to remember that relaxation is intentional too.

Yes, and this brings up another line of thought. I followed the Alexander Technique for a while (my can't-recommend-it-enough book here), and many teachers talk about "sending messages" to yourself to release your neck, and so on. Martial artists such as Peter Ralston similarly (although much more knowledgeably; that book is a guided exploration of what it is to be a person).

Basically by "send messages" they mean intend, but most people don't know how to intend. All they know is how to move their muscles, directly and clumsily. Hence all those tense-up-and-release relaxation approaches. Not needed: just lie down and intend to be completely relaxed until you unravel bit by bit and get there. You are just moving yourself from a universe where there is tension, to one where there isn't.

Q: Intent is very hard to understand because we tend to have misconceptions about it. For example, we tend to speak of intentions as if they were separate little bits. In reality intent is one uninterrupted flow. Intent has no starting point in space or time, no ending point, no transition point, etc. All the changes in intent are imaginary and somewhat arbitrary, but as imagination they're also real. Intent is also multi-level sometimes (maybe often). So for example I do a contemplation like this. I relax my arm on the table. Then I raise my arm. And I lower it. As I do this, I ask myself, when did I intend to raise it? My real answer is, "as I intend ongoingly so it is raised ongoingly." But my question demands some kind of singular atomic burst of decision, but that's not what happens. So my question almost wants me to say that I intended to raise my arm at 15 hours 15 seconds, and starting from 15.5 seconds to 20 seconds my arm was raised. This separates intent from action. This also atomizes, chunks intent into a single burst at 15 hours 15 seconds. But is that how I really intend?? NOOOO!!!! I don't do this!!! I can stop my arm at any point during raising it!! Intent is ever-ongoing!! It is ever-smooth! There is no burst! Intent doesn't precede anything. Intent is concomitant with action. In fact, intent is identical to action. Real intent is indistinct from the dynamics of experience. It isn't something that precedes or follows or exists on par but somehow separately from experience. Also, there is no obvious point where I decide to raise my arm. Raising the arm looks like a clear distinction. First relaxed, now raising. Seems like there is a difference. But there is no point in time when I can say the arm is no longer resting and now it's only raising. There is some ambiguous interval where it's maybe both resting and raising or it's unclear? But the transition is smooth. There is no sudden jump. So no matter how suddenly intent appears to change, its real character as I see it is smooth and there is no single point when we can say now it stopped doing this and started that. We don't know how to intend because we intend all the time, but we cover up the function of intent with our bogus ideas about how intent works. Intent is always: perfect, effortless, spontaneous, smooth, beginningless, endless, flowing. And now I want to mention the multi-levelness of intent. This one is simple. For example, I decide to play a game of chess. As I sit at the chess board, that intent is ongoing. I also intend to move individual chess pieces one at a time. In truth this is all one smooth flowing intent. But conceptually we can say it has two levels: 1st I maintain ongoing commitment to a game of chess, and then 2nd, in the context of that commitment I move the chess pieces according to the rules to which I have committed myself to. All this is concomitant and ultimately it's impossible to strictly separate the intent to play chess from the "individual" intentions behind each move. However, it helps to talk about intending to play chess, and then to also separately talk about the individual chess moves. That's just one example of how intent can be multi-layered.

I'm with you and not. To some extent here you are inferring intention when what is really happening is the continuation of an existing motion as a complex momentum towards an intended goal. I'd simplify this by saying: intent cannot be experiences for experiences are results; intent is injecting a goal into experience. It can be ongoing, or a flash, or whatever. It can be an instance of "free won't" - just halting a direction experience is moving in - or setting a new target, immediate ("raise my arm"), short term ("off to the shops to buy milk"), or long term ("become King of the Monkeys").

It's like making a wave in water while being the water: rippling yourself. You can then adjust the ripple's propagation by rippling in the opposite direction, or adding more detail, or whatever. You might feel a sense of resistance when you change the direction, but other than that it's an effortless process with control of details unnecessary - wu-wei?

We're probably just arguing over language here. Momentum = ongoing influence = intention. I would have been better saying changing my intention or changing my goal to be clearer. And yes, experiences always flow towards your intention. (But one does or can infer one's intentions from the experiences that arise, because you can't actually experience the act of intending itself. That's how you discover you have hidden assumptions and so on.)

I guess I was trying to get away from the idea that the ongoing influence of intention would require some sort of continual maintenance or effort; it doesn't. Resistance and effort is only encountered when you are conflicted. Am I a bit clearer there? It's always "all you" so you're never uncontrolled or running wild and all over the place, in that way. However, it should be effortless if all is well.

Q: No, this would place intent somewhat ahead of experience. It's concomitant. The intent is not in the future. You may have a future state you want to arrive at, but the actual flow is always controlled ongoingly. This ongoingness requires intentional presence at all times. It means intent cannot be removed from action to be either before or after, or you'll get a situation where some action happens by itself without intent, and then it can't be controlled in that time. Well, nothing is ever "by itself." "By itself" is not a valid state of anything, ultimately, even if it appears so. Do a little thought experiment. Imagine that you arm is raised, but don't raise your arm. Now think that it will be good to raise your arm and that you should do so, but again, don't raise it yet. This gives you the end goal, but no action. Why not? Because even though you have conceptualized a goal, you haven't moved to it yet. So intent is not really the goal. Intent is deliberate and choosy movement, change. It's choosy because you can always choose something else at any time. You can abandon your goal. If actions had to move toward goals, once you had a goal, you'd be forced to complete it. Because you can also abandon goals, goals are not intent per se.

I revise my statement, and say "flows-with"!

By 'goal' or 'intent' I don't mean a conceptualisation of it, I mean an absorbing or becoming of it. It's not an aim, although that's how we might talk of it afterwards. Let's explore with perhaps more important examples: magick. A classic New Thought way is to "adopt the feeling associated with having attained your goal" and then wait for thoughts, actions and events and environmental changes to occur until that goal is your present experience. How does your notion of 'intent' fit in with that? As I see it, I could view this as having 'changed myself' into the person with that outcome and now it's just unfolding.

Would 'intent' be better phrased as a sort of 'mental posture'? Because it's not an action itself, but language forces us to frame it as such.

Intent is not physical action exclusively. Intent is mental action of any kind. Or you can think of it as mental orchestration of action instead of action. But orchestration happens concomitantly with action.

Hmm, interesting. So, taking my example, I would say that I only need to 'intend' adopting the feeling-state corresponding to my desire (the intention and the adopting are the same thing really, I just 'adopt the feeling state' really). Then I leave it alone, and the world lines up. (In a dream, the change might happen instantaneously, but in waking life, it doesn't.)

At any point I can 'intend' again and have my experiences flow differently. The core idea here is in this "feeling" - it's the "global sense" of yourself and the world. What would it feel like if this were your experience? It is the feeling of "your shape" at this moment. In this view, "intention" isn't action at all as such, but it is "with" action, it is the decision of what your action means. The action itself doesn't matter. Summoning a feeling is probably the simplest action you can take, non-physically and non-mentally. Hmm, I am not being as clear as I'd like.

Q: Yea, because look at the big pancakes of intent here. During dreaming, you let go of objectivity to a large extent and you no longer adjust your expectations toward what you might think is a neutral standard of some sort (this is what objectivity is). In your dream world you think there is just you, so there is no neutral standard that you commit to. "Commit" is an important word, keep it in mind. Since you have no commitment to constantly adjust your experience toward a neutral standard, it flows instantly or very quickly with your intent toward your goal. When you are awake, things are more complicated. When you're awake you then have an unshakeable and abiding commitment toward some seemingly external neutral standard. You no longer think it's just you. You think whatever changes happen now have to be witnessed and approved by, and be participated in by multiple observer-participants in addition to you. This is your commitment to convention. So whatever other commitments and intentions you try to generate during magick, they happen in the context of that prior commitment to convention. Guess what? That context is not magick-friendly. The whole point of that context

is to make it look like experience isn't owned by you! If it's a neutral ground, you can bring some changes to it, but no huge change can be done by you without some cooperation of others. You can move your body around by yourself, and that's about it. Anything more fancy requires cooperation. In other words, the whole point of that commitment to convention is precisely to prevent magick. So if you try to use magick as an ordinary human with a commitment to convention, which most humans maintain unshakably, then it's likely to either fail or work super-feeblely. What you really want to do is something crazy. You want to abandon your commitment to convention. No more neutral ground. You absorb all of this waking phenomenal reality into yourself as your dream. It's no longer a democracy. Now it's just you, just like in a dream. Now things are not fair anymore. Now you've made yourself a tyrant. Now you can use your magickal intent. And now without your commitment to humanity (convention) you can make things happen as quickly as in a dream. However, because all this is done in a kind of inhuman state, it would be scary as fuck, because as you do this, you wouldn't be doing this as a normal human. When you abandon convention you're basically at least temporarily leaving your "I am a human" card on the table. You're not acting with human limitations, but then you're kind of like a beast or a deity. You're not human. For most people this is too freaky to even contemplate, never mind actually experience.

I agree on the commitment thing. It's the, erm, magic ingredient. I used to use the phrase "fully intend", but there's no decent way to say it. Essentially, it just means step forward without a care for doubt and have it happen. Still, this loops us back to the intersubjectivity thing. Now, I know I can have other people behave differently, and for recent events to be effectively 'deleted' so I can have another go, and so on. And I know I am not a "person".

I am all people? Am am none, I am the people, the environment, the space in which the environment residues, and "that" in which the space appears. What are you? What happens when "we" both reshape ourselves (i.e. the universe)?

Let's say you perform a powerful spell where you take control of the world as your dream and you kill me. Poof. From your POV I am gone. But from my POV nothing happened to me. So I can't see the you that knows I am gone in my world anymore. So our subjectivities diverge. In my world I get a copy of you that never performed the spell. And in your world you get the world without me in it.

Yes, **this**. Taking this further, by making it less extreme, if you and I "intend" different things, do our subjectivities diverge so that we both have the experience we desire?

And the "you" that I am left with, what is that? It's a "you" without anybody looking through that "viewport"?

You want to settle your mind on what I am, right? But truth is, there are so many versions of me that whatever you settle on as me is also me. So if you decide no one is looking through this viewport, that's possible. That's within the continuum of what I could be. If you decide I am not a pzombie and I am looking through the viewport of this body, that's possible too.
We always try to eliminate ambiguity, don't we?

Yeah, this is the core of what I am getting at with the "intersubjectivity" topic. It also helps tackle some of the moral issues that players in the game might come up with. My previous approach to this was to think of ourselves (myself, yourself, whoeverself) as "extended beings" across all possibilities.

So, if we think of a (rather multi-dimensional) grid in which all possible moments, all possible experiences, are laid out, each from my 'viewport perspective' - well, I am extended across all of them, but I am only looking into one of the locations at a time. The history or 'timeline' of myself is the path I travel across that grid, moment by moment, choice by choice. I tried exploring this idea through the perspective of time travel a while back - taking this more extreme example of 'changing the moment' to try and bring out the issues and details - but actually I think it just confused the issue, because of course people wanted to discuss actual time travel mechanisms a la sci-fi.

Time is a very interesting topic. I see two types of time. Conventional time. That's something like today is September the 7th, 2014, 3 hours, 3 minutes. This kind of time we try to all agree on. This time pertains to the supposedly neutral common ground, the objective realm of the Earth and the "physical" cosmos, etc. And then there is subjective time. Subjective time can include things like your past lives, dream time dilation experiences, and other time dilation experiences, etc. Subjective time is your own time as you experience it and it can dive into and out of conventions of all sorts, loop back onto itself, etc.

I think 'time' gets to the heart of things, because what we often implicitly mean by magick and manipulation is a discontinuity in our experience. A jump from one moment to another moment that would not normally follow from it.

Conventional time is surely imaginary?

...

Let me put it this way. Goals don't set themselves by themselves. That's why intent isn't the same thing as a goal.

Yes, that's fair enough. Goals are a conceptualisation or representation of a desire. It has no 'motive force', just as simply owning a photograph of a nice fast car doesn't create any momentum towards you actually owning one.

Precisely

With this stuff, there's always a hurdle of developing a common language with which to discuss it. So let's have "goal = conceptualisation or image". So, can we say that "intention" is the meaning that is attached to a particular act, be that mental, physical, or something else? Or even more broadly, "intention" is the meaning we attach to a particular change. This means that intention itself can't be experienced alone; it is not a thing, it is almost an applied interpretation, live.

(We're returning a little to Alan Chapman's idea here, that it doesn't matter what you do as your magickal act, it's what you decide it means that counts.)

I agree that intention cannot be experienced alone. That's why I keep saying how intention is concomitant with change/action. Another word we can use for intention is permission. So if I intend to raise my arm, I permit myself to raise my arm. If I intend to relax, I permit myself to relax. So allowing, permitting can be thought of as intent. A synonym. Does that help?

I think we are essentially agreed. I don't really mean 'assigning' as a label attachment - that returns us to conceptualisation - so much as doing-with-purpose. It's simultaneous. The language is introducing a duality here where there is none. Another way I see this is a 'releasing into a direction'. When we walk forwards, we release ourselves in that direction, as an analogy. I believe intention is the fundamental thing. It's a muddled word. Are we better to just jump in and say it's free will and we have free will because we are the fabric of experience, and so can shape ourselves however we choose?

Excuse this extended quote, but it's from a decent recent book which tries to capture some of what we've been discussing, without me having to type too much (Bernardo: see this as promotional!):

==*So, in the context of all these metaphors, what is it that makes mind move?*
Notice that the answer to this question cannot be a phenomenon of experience, since experience is already mind in motion! Whatever the primary cause of the movement of mind is, it cannot itself be a movement of mind. Thus, we cannot find the primary cause in physics, biology, psychology, or any area of knowledge. The difficulty here is the same one behind the impossibility to describe the medium of mind itself: since all knowledge is a movement of the medium of mind, that which sets mind in motion cannot be known directly. But we can gain intuition about it indirectly, by observing its most immediate effects in experience and then trying to infer their invisible source. Our ordinary lives entail unfathomably complex chains of cause and effect: one thing leading to another, which in turn leads to another ...and another, along the outlines of a blooming, unfolding pattern that we call the laws of nature. But at the very root of the chain of causality there seems to be something ineffable, tantalizingly close to experience, yet just beyond it: freewill. Whenever you make a decision, like choosing to close your hand into a fist, you have a strong sense that you were free to make the choice. But usually that sense comes only after the choice is made –immediately after – in the form of the heartfelt certainty that you could have made a different choice. The direct experience of freewill, however, remains ambiguous: before you make the choice it is not there; and then the very next experience seems to be already that of having made the choice. The experience of making the choice seems lost in a kind of vanishing in-between limbo, too elusive and slippery to catch at work. It is as though freewill were outside time, only its effects insinuating themselves into time. Yet, freewill can be so tantalizingly close to experience – perhaps arbitrarily close – that many people are convinced that they feel the actual choice being made. Personally, despite having paid careful attention, I have never managed to satisfactorily ‘catch’ this elusive experience in an unambiguous manner. I can’t prove it is not there, but I hope to have evoked enough doubt about it that you are open to the possibility that choice itself is outside experience. We only really experience the prelude and the immediate aftermath of choice, never the making of a choice. Though I am aware that this is the trickiest element of my entire argument – resting, as it does, more on introspection than logic –I contend that freewill proper is the primary cause of all movements of mind; the freewill of the

one subject of all existence. Freewill can never be experienced directly: it is the driving force behind all experience and, thus, never an experience itself. But we can infer its existence from the retroactive sense of free choice that we have immediately after making a decision. This sense of free choice is, so to speak, the ‘echo’ of the primary cause reverberating within our psychic structures.

- From Why Materialism is Baloney - Bernardo Kastrup==

...

This is junk, sorry. Choices are not important. Never confuse volition with choices. I was talking about this before. Volition is not something that comes in atomic little localized bursts and I explained why not.

I would tend to just use "intention" for all of the above, with context adjusting the meaning. The reason is that it's the most vague version, which doesn't necessarily imply "doing" or "gripping", which to me gives the wrong sense. All of them just mean "directing the content our experience" in some implicit way, surely.

Whenever you make a decision, like choosing to close your hand into a fist...

To be fair, here I think he's just trying to point out that you can't experience the doing, the "first cause", so people retrospectively tell themselves a story to fill the gap. There are moments of redirection and interference, however, when we change course. Calling them "choices" or "decisions", those are just best-effort words to fill in an event that is ungraspable as an experience.

This is confused. I don't believe this at all. I already explained what problems I see with this narrative and I don't feel like repeating myself. His fault from my POV is that he's chunking intent. Intent should not be chunked.

Hmm. I agree there is no real "stopping-and-doing" but it's difficult to discuss this without isolating examples, even though that isolation is false. So I'm giving him a pass on this, for now. ;-)

I'll give it one more try. Every moment is a moment of choosing. They're not some rare and special moments that happen only once in a while. Now take all the moments and erase boundaries between them. Now you got what I call "intent" or "volition."

I know what you're getting at, that's why I said there's no "stopping-and-doing". Although conceptually this is fine, I find I don't really experience each moment as a moment of choosing, when I examine it. I think that I could if I were more attentive and present, but I don't. I seem to drift in and out of that over time.

But I do! :) I experience it! :)

I think this is part of the point of this sub, and of Dream Yoga. You have to examine your experience in order to change it. You can have that experience if you hold on to yourself. Really entering into a Dream Yoga view, though, surely you would have the opposite sensation? Just a thought. Funnily enough, arm experiments like that were something I did do when following that Peter Ralston book (Zen Body-Being), which is all about exploring how you work. There's a 'pre-feeling', then a movement, that is ongoing. But the key is my attention is on it. Meanwhile, my foot is tapping up and down and I haven't noticed, and I'm frowning with one eye slightly closed and I haven't noticed.

Think like this: if you think there is a unique and specific moment of choice, then what is this followed by? A choiceless moment? And then what? Another choiceless moment? At what point will your ability to make choices come back?

You can make choices at any time - i.e. interfere with what's happening. The ability never leaves, provided you are present to the moment. But you need not ever interfere. Zen Buddhism is much concerned with the arising of 'natural action' as a response to the environment, for instance, without 'doing' or 'choosing'. You are not required to manually control yourself each moment. You can do so at any time, but equally you can step back and let things happen. In fact, you probably live most of your life this way without noticing.

Then there's is Jiddu Krishnamurti's way of describing 'choiceness awareness':

==*Krishnamurti held that outside of strictly practical, technical matters, the presence and action of choice indicates confusion and subtle bias: an individual who perceives a given situation in an unbiased manner, without distortion, and therefore with complete awareness, will immediately, naturally, act according to this awareness – the action will be the manifestation and result of this awareness, rather than the result of choice. Such action (and quality of mind) is inherently without conflict.*

- Choiceless Awareness, Wikipedia==

...

The only way you can't be present is to choose not to be. In other words, you end up always winning here, no matter what.

Attention is a filter, not a torch-light. But, it can get stuck and localised, defaulted. A key practice is to dissolve that boundary, expand back out again, I have found.

When you don't interfere you are still choosing moment by moment to maintain a space where things can happen in a disowned context.

This isn't an ongoing choice though. Once you've 'stood back', you don't need to keep re-choosing it, maintaining that position, once you have practiced this for a while. At first you do need to maintain a space because your default attention might be highly localised; but this will loosen by itself eventually, quicker with encouragement.

Think about the state of the muscle in your tongue. When you move your tongue during speaking, do you interfere with it? And when you stop moving the tongue you stop the interference? This makes it sound like your tongue has its own mind and its own desires that you interfere with.

You don't interfere in such detail, or should I say "choose/direct". The choices you make tend to be broader than that, and everything falls in line. Just as when you stand up from sitting, your body coordinates itself, you don't have to manage all the muscular movements individually - or at all. By interfere, though, I'm not suggesting a separate 'interferer' and an 'interfered with', although you can artificially experience one.

Nonsense. Sorry. There is no independent reality. Because there is no independent reality, there is no free-of-bias anything.

There is the 'relaxed position' of things, however. What you get if you stop forcing your experience. This isn't about there being a 'real underlying reality' or whatever - just about 'mind' (or whatever you want to call it) being left to settle. Note though, a relaxed mind isn't necessarily an unmoving, unchanging mind - just as a pool of water will still have its original ripples once we stop disturbing it.

Besides, isn't a torch-light a filter of sorts too?

Attention is a filter in the sense of being a masking process. The key difference in the default state implied:

- With the torch-light metaphor, the implication is that the default state is nothing - no content - and we have to actively, with effort, shine our attention on things to gain information.
- With the filter/mask metaphor, the default would be wide-open awareness, and what we're doing is contracting that to have our attention limited. Furthermore, with a mask your attention needn't be a simple 'circle of light', it can be distributed at different intensities across experience - for instance, people have a tendency for their attention to jump to the objects in a room, and be unaware of the spaces between.

All choices are ongoing

Okay, this is our way out. I would agree that choices are ongoing, just not that they are necessarily continually, actively made or re-made. If that make sense. Meanwhile, we could rephrase relaxation as a release of attachment, if that's better for you.

Would your filter metaphor...

The filter metaphor of course also allows for a focusing and active constraint. It's "the win" because it gives you the benefits of the torch-light metaphor (narrow attention) with the benefits of open awareness and of structured attention over space. (It also corresponds nicely with some research on 'attentional styles' and perception etc.)

Wide open awareness means awareness that is open to possibilities. One such possibility is absolute nothingness.

There are two senses in which attention can be wide open. One is in the sense of right now, taking everything in as it is in 3D-space and more - including the underlying background awareness for everything. Then there is 'what is possible', also opened up. So, yes.

Filtering suggests that you aren't meddling with anything...

I see where you're coming from. It's the 'creative aspect'. The filter doesn't imply that what's outside the filter is safe from influence and manipulation. It is a filter of attention which overlays awareness. Awareness itself is unbounded. There is another thread to this of course: The creative aspect of attention. In a lucid dream, I open a door, and without fail there is something beyond it...

Then it's not so bad, but I'd wager you'd be dominated by the presently apparent phenomena in this mode.

Not if you have direct experience of the open unbounded space. The idea of the filter is that if you release it, you are unrestricted in that way. You would experience the phenomena in context - the context of a dream-space.

Filter metaphor suggests that objects of attention exist before the act of attention attends to them. That's how materialists think.

Not really (just). Berkeley's idealism, for instance, doesn't suggest that experiences don't exist in some way separate from an individual attending to them. He phrases it as everything being witnessed by "the mind of God", by which we really mean that there is an unbounded consciousness, of which each of us is a part, or a witness via a perspective.

I don't conceive of myself as filtering something...

If all possibilities exist, and you are only experiencing one, then you are filtering, not creating. But this is really just how one thinks of it. We've moved along here somewhat though, from what I initially meant.

Two sorts of filtering, then:

- **Filtering of the 3D Present Moment Experience:** Here I am, right now, experiencing this moment. I don't feel that "I am a vast open space", I feel more enclosed than that, more constrained. If I let go, however, I find that my "hold" on the experience loosens and opens out. If I keep doing this (over a long time) my 'attentional profile' gradually expands and opens. Alternatively, I can force this by actually stretching out evenly into space. This removes the distinction between "me" and "my environment", letting me feel the dreamlike nature directly. This is something I have deliberately experimented with.
- **The Filtering Of Possibilities:** Enfolded within every moment and every space is 'all possible moments'. Like a configuration space with all possible combinations; we are at one location in the space at any one time - we have filtered down all possibilities into a single current experience. The current experience is the 'unfolded' one. This is more a way of conceptualising possibility.

The latter might be better viewed as a creative act, an implicit or explicit one. The first one was really what I was referring to. I assume already that "anything is possible".

I'm not a part. I am the whole thing! And so are you.

Yes, it just seems we are a part, because we have a perspective. Just because I am not constantly experiencing all my memories all the time, for instance, doesn't mean they are not enfolded in me. (Not a great analogy.)

You see the need, though, for things to be 'enfolded' somehow? Because we both need creative access to 'the whole thing'? All time, all space, all at once?

Extra thought: we are not actually 'located'.

Creative access = opening the filter = dropping inhibitions / restrictions. It's always access to yourself, of course.

Additional Question: What's your problem with advaita/non-duality?

Now, there are some authors I think are pretty rubbish (Tony Parsons, for instance), and many of them don't get how free will can be incorporated, even though to me that just drops out of it naturally. However, it does seem to me that most are striving for a similar thing at root - i.e. to directly experience that there is no separation between you and your environment, you are "all this" and there is no underlying solidity beyond that. Meanwhile, most idealists are happy discussing it philosophically, while never actually **living it**.

I dislike Advaita teachers because they promote choicelessness and absence of free will.

I agree that will is paramount. In fact, one of my concerns about subjective idealism as commonly treated is that it doesn't adopt this fully, due to still holding onto the notion of 'objects' and encountering rather than being or making. Will forms perception, it is inseparable from awareness, because the Will is about changing awareness. I think it's the "Neo-Advaita" people that are particularly bad (that one can't say anything, basically!). We should probably separate Advaita from Non-duality; there are people in the latter camp who have a better grasp of things.

This isn't what I want at all.

If you and the environment are not separated, 'merged', then it's surely saying that it's all under your control - there's just experience under Will (or "ongoing choice" as we phrased it). Better to say: you don't merge, you just recognise that there was no separation. Of course, it's up to us whether we want to experience 'being a body with magical powers' or 'being this whole room and changing it how we want'. I want that cup of coffee over there to change into a glass of water? Well, I am that cup of coffee, so no problem.

The feeling love thing, so not what I mean. I mean something more like, bringing/recognising your surroundings are under your influence.

The experience can feel like merging when it happens, but in fact it is just realisation. Delocalised experiences can be a mix of exhilarating and terrifying. Which is not unexpected: it feels like a threat of death, and in a sense it is. It's a big hurdle for this stuff, which is why most people are happier with servitors and sigils and so on for magick - an obvious intermediary that you are "sending out in to the world". People are resistant to OOB-type events for the same reason. Separation anxiety?? :-)

I am so fucking glad I invited Triumphant George instead of Pavlina. I know Pavlina would not think of this cool thought even in a million years, sorry. You are superior to the people you quote, imo.

Why, thank you, most kind.

The technique I started off with was the 'rope technique', of which there are a few variations [<http://out-of-body-experience.info/best-techniques-out-of-body-experience/>]. But basically, you just relax and try to 'feel a rope in your hands' as you pull yourself out. It takes a lot of courage to push through the initial vibrations, and other potential unpleasantness. (If you haven't played with this in a while, it's worth a punt, just to see what happens now...)

Ah, this is astral projection, which is also very interesting. But in my experience it felt like my actual physical body lifted up. It was no AP. I was alone in the room, and I am describing an experience here. I hope no one jumps to any conclusions.

Don't worry, I'm a total narcissist really.

But in my experience it felt like...

Interesting. The whole area of resistance is a curious one. For instance, if we lose our keys we are happy to look over at a nearby table and see them there, even though there's no way they could have got there. However, the other way round - we look at the table and then they appear in front of us - we're less happy about. Even if we think it might be cool. So we filter out those possibilities, those "reality shifts". And this is before we've even begun deliberately willing changes.

I take all stories with a pinch of salt, but people do seem to get quite thrown by fairly simple changes [<https://realityshifters.com/pages/yourstories87.html>] because it raises other questions: in that case, if my world changes, do I take my friends along with me, or do I now have different friends?

This adds an extra level of caution to intentional acts.

Back to continuum of being. They're not the same or different. There are levels of difference and levels of similarity, but the exact relationship is ambiguous I think. We can of course try to nail everything down in an attempt to gain conceptual clarity. So we can say they're different, for example. That's fine too. But really nothing can force us to think that. It's just a choice.

Yes, but from the person's perspective, not having a philosophical framework to refer to, and mostly never having even thought about this before, they get pretty spooked. Some deliberate efforts at world-changing, like the 'Tesseract Magick' experiments (pinch of salt but interesting), make a definite point about bringing people along. Better maybe to say that aspect of a person?

Some of the ones in /r/glitch_in_the_matrix are apparently absence seizures: here, here, here. Or... is that just what the experience seems like because you didn't take anyone else with you when you 'jumped'? (If you look for an explanation, surely you will find one, such is the creative nature of attention.)

Even having a solid philosophical framework is only a minor advantage, I think.

It might make the difference between "hey, cool!" and losing it. But as we've covered previously, there's a difference between having thought about something and knowing and feeling its truth. People dabble with magick, having read all the stuff, and it's all fun and joy until demons actually do turn up!

"Better maybe to say that aspect of a person?" Better for what purpose? Goodness of this or that is relative to some aim, right?

My aim in saying "aspect" was because it fitted in nicely with my concept of "extended persons". As you say, we often strive for clarity, but if I just say "extended person" then the nature of that extension - multiple copies, multifaceted, holographic - can stay nicely ambiguous while still conveying the notion of being more than just "this version, here", and "aspect" sits well within that. No metaphor I've played with really fits. Which is to be expected, in a world of infinite possibilities... ;-)

This area is why I was questioning your notion (as I read it at the time) of choices being continually actively made, although I like "ongoing choices" or "continually active choices" as an alternative.

Because this version of me, typing at my Mac, is the "viewport version" as I see it, the one I am experiencing in my "space-that-is-me", and from this perspective all the other parts of my "extended being" as seen by other people are philosophical zombies. They are unfolding in automatic fashion, choices unfolding in tune with their trajectory and character, but not being redirected.

So you see the real yourself, while when I look at you I see a pzombie? I am not sure I understand.

Yes, effectively the "extension" is infinite, but it's simpler to visualise. For instance, I think of all possible moments as being a grid of 'viewports', with each square in the grid being a 'picture' of the view into that moment. Of course, that grid is infinite, and the adjacent squares aren't spatially located so there's no 'adjacent', and they aren't squares, and the 'picture' is actually an entire world from a particular perspective. It's just about giving myself something handy to refer to, while understanding that it is just a partial representation of something that, essentially, cannot be represented by its nature.

Thinking in terms of continuums helps me to avoid thinking about people as if they were substances.

This is key, and that's where the 'viewport' idea comes in originally (as a first stab at this). You see, from your own perspective you aren't here at all, you're transparent, you are just 'tuned into' this perspective on this environment. You are only a person from others' perspective. Playing with this, what "you" really are is "that which looks through the grid" or the opportunities it represents. I filter my attention so that I am only experiencing one particular possibility, one grid square viewport at a time. What "I" am to you is a picture, an image, which may or may not have a consciousness looking through into this part of the grid. Of course, as an "extended person" all possibilities are playing out in character, it's just that I am not necessarily attending to that part. If I am not attending, it's like I am a philosophical zombie, that part of me.

Typical, conventional people will see my vivified body as a person. They won't see my subjectivity the way I experience it.

They don't perceive your subjectivity, just a picture of Nefandi, moving about, implying a subjectivity. Whether you are 'really there' or not is not detectable from their point of view. There is also the issue that the particular 'you' they are experiencing as a companion in their world is something they themselves select, implicitly or explicitly.

Every POV is ultimately possible. That's the secret.

Yes, that's right, that's the thrust of the 'grid/viewport' metaphor effectively. On deeper analysis, the pzombie problem actually disappears because of this, but it's a handy way of imagining at the earlier level.

Sure, but it's not my problem. ;) It's their problem. I am fine.

Heh, quite. And this is not a bad point to make: since you only actually experience one 'selected reality' at a time, the rest is basically imaginary thinking-about, just a way to keep the possibilities alive within you. Thing is, once you make a jump, you can't get back, because the history of the jump is now part of this moment. You can perhaps go to a new moment similar to the previous, but that moment-prior is inaccessible with the memory intact, sort of by definition. If we delete aspects of the world (Lathe of Heaven), fixing it won't take it back really, the best you can hope is to make it as indistinguishable as possible. But then, how much control of the details is really possible?

What you say is only true if you don't want to edit your own memory, but want to keep your memory "straight" as it were, without any funny business, while limiting all the weirdness to the external realm. So you keep your subjectivity neatly organized and ordered, which means your memory is stable, while all the crazy jumps and magickal events are affecting only things you think are "external" to your person.

Yes, as you traverse 'the grid' I think you would want to retain the memory of your path, wouldn't you? Of course, you could never know for sure that you had done so, because the memory is also part of the world associated with your the grid/viewport position. I can't think of a reason not to want to retain an 'internal' trail of the jumps/changes made.

Boredom! The almighty reason for everything.

Well, eventually. That's the old story about God though, isn't it? God gets bored and so deliberately forgets himself to make it all exciting. How far can I push it? Further, more adventurous, more apparently risky. Finally, what would you dream? You'd dream this dream, of powerlessness. (The Alan Watts angle on it.)

Precisely. You don't think I chose the word "almighty" in "almighty reason" by accident, do ya?

Heh, good.

I'll tell you a little secret. I am in the process of creating a number of very powerful lords. Overall this will increase chaos in the apparent world. And that's because I don't like our world, and I am bored besides.

They won't stand a chance against my machines.

I don't think you get my meaning. When I say "lords" what are you imagining?

Video game reference.

Heh, not even close. I guess I'll let you remain ignorant. Looks like my secret is safe even though I told you what it was.

Haha, sequence error on my part (was just reading something and it made sense). Serves me right for being flippant. My second guess (vague memory, had to look this up) is Michael Moorcock's Elric saga. It matters not, of course, because perhaps tonight I will mentally edit this exchange so that I was right all along. ;-)

And: What's wrong with our (apparent) world anyway?

You're not in an occult frame of mind when you make your guesses.

This is true. I'm parallel processing right now. You're lucky I wasn't anticipating an apocalypse of New Zealand singer-songwriters.

"And: What's wrong with our (apparent) world anyway?" What's right about it?

Hmm. If there's something wrong with it, that really means there's something wrong with me. Or rather, something wrong with you, depending on your perspective...

I vote you. Because the world seems alright to me.

My world is not a democracy. But you simply happen to be right anyway. I don't like this world and I will change it. In fact, I already have changed it and will change it some more. When I am done, I will like it again. Who knows how you will feel though, lol.

Subjective decoherence will see me right, of course. In fact it already has, naturally.

That's not what I will see. ;) But you already knew that.

Quite! :-) Oh, but I still want to know what it's wrong with it, that you would change. (Beyond simply destructive fun, of course.) Out of interest.

Rampant philosophical materialism. Religion. Dogmatism. Property ownership.

If you hang around long enough and are successful, subjective idealism will turn into a religion! Albeit with only One follower. ;-)

Well, materialism, religion and consumerism have become the assumed structures of our time I suppose. They're all under pressure though? Property ownership will become a vaguer notion, but not without a massive copyright fight. (Once digital copying => 3D printing => generalised object instantiation.) It's the rebalancing of money-power that's the real worry. "I drink your milkshake!"

Perhaps you can help it along?

P.S. If you ever get the chance to time travel then, you might want to pay a visit to Edward Bernays, the father of modern marketing and manipulation. (If you ever want to get all het up, I recommend reading his book.) Also check out Adam Curtis for further fury. I've been looking into this stuff recently.

There is no "perhaps" about it. I've already helped it along. I guess I can help it along some more, but I also have my own personal interests. There is a hard limit for how much I care about this conventional world and this world's destiny. I do care some but only so much. And after that I really don't give a shit if the moon falls from the sky and everything burns.

Fair enough!

...

Q: From the Tesseract Magick link:

There are phenomenon that we should warn you of. Time will sometimes be perceived in a different way immediately before, during, or after a Tesseract. This increases in the practice though the fear and uneasy feelings concerning it go away in time and experience, rather like fear of flying. Precursor effects on reality are usually balanced by after-Tesseract events, and are often symmetrical with them. The effect can be sudden shifts in time or space. Driving a hundred miles in less than 20 minutes. Going through the same stop twice in the same direction on a public transit system. Losing the entire day, someone once skipped their birthday. Distortions in space. Being able to perceive beyond a closed door to the extent that you walk into it. A universe where the sky is red and has green cracks in it. Universes where there is no radio or TV on the air, and there is a smell of ozone in the air (jump again immediately!) People can change eye color, hair color, height, weight, or personality. Only those that jump with you can be counted on. Everyone around you and every social circumstance can change rather dramatically in the most highly vectored jumps. Some say that Tesseract jumping is a better version of suicide, and should only be undertaken in the same circumstances. Some say it is habit forming and leads to permanent tourist syndrome toward any universe one finds oneself in. This is gnarly. :) Notice the psychological link to suicide too? Once again we're back to the warning post.

Quite. I thought it might appeal. I have experimented a little, but nothing so Philip K Dickian has resulted. (Incidentally, this is one reason why Flow My Tears... is included on the reading list, along with Ubik. Now, there's a guy who had some experiences; he kind of blended his reality with his writings.)

Only those that jump with you can be counted on.

Yeah.

When I was in college I missed an exam once, which is to say I was sure the date of the exam had passed, and then I unconsciously made it as though I still had a few days until the exam. This was interesting, but also the only reason I even remember this is because of this conversation. That experience drifted away from my conscious memory pretty quickly. I say "unconsciously" because I didn't perform any kind of magick working or anything.

The memory part is often a problem. But luckily not just yours.

My favourite New Thought friend, Neville Goddard, has a good "pruning" [https://realneville.com/txt/the_pruning_shears_of_revision.htm] exercise which I really should remember to do more often: Each night, replay the day you've just had and amend it to your liking. Change all the errors to what should have happened; delete those disagreements. Reset the situation for the new tomorrow.

Go into a shop, ask for something. They don't have it? Go take a browse, delete that conversation and reimagine it. Try again. Change your feeling of the world into one where it is there. If you do this wrong though, through being inattentive or casual, it can go really wrong pretty quick. It's much easier to do forward work though. For instance, have tomorrow's exam contain the two questions you actually studied for. That's more everyday magick of course, but its apparent retroactive component can be a challenge for some.

Meant to add: I think things like this happen all the time, we just don't notice it, because of an apparent rule of self-consistency. That is, memories and the moment seem to fall in line. Perhaps the world does indeed get recreated each moment, in line with our direction, amendments as required/desired...

Q: Go into a shop, ask for something. They don't have it? Go take a browse, delete that conversation and reimagine it. Try again. Change your feeling of the world into one where it is there. If you do this wrong though, through being inattentive or casual, it can go really wrong pretty quick.

This is how I break locks on the doors to my apartment building, lol. What I do is assume the door can't be locked and pull it. I hate having to open the front door, basically. It's a hassle. So I just pull it. Sometimes the door is locked and when I pull it nothing happens. But I don't give up. I have a habit of pulling the door while assuming it can't be locked. Then what happens is I find the lock is broken, or the door is slightly ajar, or the lock mechanism failed to engage, etc. I even surprised the fuck out of my wife a number of times by magically opening the front door that wifey was sure was locked. haha.

I like the locks thing, nice. What I'd like: deliberate fast travel [<https://realityshifters.com/pages/yourstories98.html>]. (Glitch 'n' shifts sites are good for inspiration I think.) There's also that whole siddhis teleportation thing [<http://tomkenyon.com/siddhis>] for one day. A little ambitious for now, though.

The revision exercise is a good one, and it helps practice what I think is vital: generating the feeling that summarises something as being true/real. His Power of Awareness book is worth a read; I should add that to the list. His lectures tend to emphasise his Bible-as-instruction-manual-to-reality mindset, but his books less so. And it's free.

Q: *I like the locks thing, nice.*
Yea, it's tame when it works, so anyone can try it. Things like fast travel can be stomach-turning for some people. I don't know if I want to be practicing fast travel personally. I want to find a gradual path to these things. So something slightly better than fiddling with locks maybe should be next. Maybe, or maybe not even better, but just more similar stuff until it becomes routine.

A small, repeatable change of some sort. Things like the "prune the day" exercise are a good place to start though, just for general use, because of the apparent indirectness, but the measurable effects, in terms of unlikely reversals.

TriumphantGeorge Compendium - Part 3

Stanley Sobottka: A Course in Consciousness

This short dialogue [Deleted] provides a nice quick summary of how to get from "here" to "there" - a sort of "reality loosener" for times when all this stuff seems a bit too solid. The full course is quite interesting, a well put together survey of all the different aspects of science, metaphysics, and non-duality. I recommend it. It covers everything, even if you do not agree with its conclusions yourself, it will give your reference points for all the issues. Valuable material, even if it doesn't quite embrace the "subjective idealism + magick" aim of this subreddit:

When we realize that "we" have no control, there is a sense of freedom and energy because control is bondage even if we think "we" are the ones in control. This freedom brings with it the awareness of a power that is mysterious and profound, the power of Consciousness (God). Ironically, if "we" try to use that power, it disappears. This is a twist on the saying, "use it or lose it". Instead, it becomes, "if you try to use it, you will lose it". If "we" toy with the power of God, "we" will get burned by disappointment and disillusion, but when we realize that "we" have no control, the power of God, even though subtle, becomes awesomely apparent.

...

I brought the topic up over here [Control vs Letting Go] - albeit not being so direct so as to encourage discussion - and there were some interesting responses worth a look.

I would love to see a discussion of this here. My intuition suspects that the apparent polarity of control vs no control is itself a misunderstanding of something fundamental that underlies both understandings. But I don't know enough about it myself

The short version from me, to have control is/requires a release of control. We release ourselves into a direction, rather than push ourselves into a direction. That we feel that effort is required is a misunderstanding. For instance, we tense up our muscles in order to move, to 'feel ourselves doing it', but actually the tensing up gets in the way of our movement!

The Arm-Wrestling Exercise

Get a pal, challenge him (or her!) to an arm wrestle. Now, you're going to try two methods:

- The first time, put lots of effort into it. Really and try to win that competition! Use all your power, all your muscle!
- The second time - don't. Once in position, simply decide that you are going to win, and then leave your arm, your muscles, completely alone. Direct your attention elsewhere (into the space around you, onto the place you want to end up, the space behind your forehead - just keep out of your arm), and simply wait until you've won.

This illustrates that the attempt to control actually gets in the way of getting what you want, in this case. Make the decision, let the path unfold by itself. See here [http://doorsausage.blogspot.com/2009/09/what-fetching-suit.html] for an interesting tensegrity-based description of this.

Imagining That

Imagining That

WHEN we talk of imagination and imagining something, we tend to think about a maintained ongoing visual or sensory experience. We are imagining a red car, we are imagining a tree in the forest. However, imagination is not so direct as that, and to conceive of it incorrectly is to present a barrier to success - and to the understanding that imagining and imagination is all that there is. We don't actually imagine in the sense of maintaining a visual, rather we "imagine that". We imagine that there is a red car and we are looking at it; we imagine that there is a tree in the forest and we can see it. In other words, we imagine or 'assert' that something is true - and the corresponding sensory experience follows.

It is in this sense that we imagine being a person in a world. You are currently imagining that you are a human, on a chair, in a room, on a planet, reading some text. We imagine facts and the corresponding experience follows, even if the fact itself is not directly perceived. Having imagined that there is a moon, the tides still seem to affect the shore even if it is a cloudy sky. And having imagined a fact thoroughly, having imagined that it is an eternal fact, your ongoing sensory experience will remain consistent with it forever. Until you decide that it isn't eternal after all.

Exercise: When attempting to visualise something, instead of trying to make the colours and textures vivid, try instead to fully accept the fact of its existence, and let the sensory experience follow spontaneously.

Next up: Teleporting for beginners.

...

There is no external. So, plot twist: there is no internal either!

Yes, everything is pretty good fun. :-)

...Got ya. Well, you'll probably already get a few more red cars in your life just as a result of reading that post. ;-)

The fun is in pushing to skip intermediate experiences.

Q: *When attempting to visualise something, instead of trying to make the colours and textures vivid, try instead to fully accept the fact of its existence, and let the sensory experience follow spontaneously.*
There is value in making the visions vivid as well. What your saying is orthogonal to making one's visions vivid and visceral.

I'm really saying it'll come for free. I'm saying that the way to experience a vivid object is to imagine that there is one, and let your experience fall into line. You can't "vivid" the image directly, because it has no substance. But obviously vividity is desired.

But I don't think it's wrong to emphasize vividness first. It's gentler. What you suggest is a much stronger shift toward the crazy.

The exercise (as described) is for "mind" visualisation rather than external creation (let's not go there yet). I found taking that approach completely changed my results. Instead of trying to "draw" the image of a cube floating before me, I declared there to be one there - letting the "drawing" take care of itself. Because if something is there, of course I can see it. "Leading in", to make the desired result an obvious and inevitable conclusion. Harnessing the auto-complete function.

Especially with you talking about teleporting next.

It's a fun exercise. And if you are truly dedicated...

This wasn't obvious to me at all [mind level]...

They're the same. Sorry, I'm actually confusing things by typing away here on mobile (not least due to autocorrect). The post is about material-level visualisations (experiences) that you aren't even aware you've made via "imagining that". In short, your life as you (or "people") are living it now, usually without realising. "Imagining that" shows that we produce experiences by implying their inevitability according to facts we have accepted or allowed. The exercise deliberately doesn't differentiate; the process is identical. The only difference is... the immediacy of the change from an image to an experience, and the directness of the correspondence. Visualising will always lead to some result of some sort. What sort of fact are you creating?

"Imagine that" there is a cube in front of you. Does a cube intensify, materialise, condense, drop to the ground in front of you? Or do you walk into the next room to find that the TV is showing a program about 4D geometry and the history of the tesseract (thus giving you both the cube and the context).

How real does it have to get before it changes from being "triumph" to "terrifying"?

You're willing to take us as far as any of us dare to go, am I right? Or am I right?

What can I say? When you're right, you're right - and you're right. :-)

Q: "Imagine that" there is a cube in front of you. Does a cube intensify, materialise, condense, drop to the ground in front of you? Or do you walk into the next room to find that the TV is showing a program about 4D geometry and the history of the tesseract (thus giving you both the cube and the context).
The first happens, but the cube not only doesn't drop in front of me, it is quite faint unless I strain myself looking for it while making efforts to ignore everything else I am now experiencing.

Okay, I'm going to say: no effort at all. Relax, and quietly and continually assert the fact of its existence. Don't interfere at all with whatever arises in the senses. After all, when there is (say) an apple in front of you, do you try to make it more vivid? Of course not. The object is a fact, it's appearance is inherent - the images comes to you, you simply receive it. Let the world come to you. So again: focus on the fact of existence. Quietly assert the fact in a mood of expectation until it feels and becomes "true".

Q: After all, when there is (say) an apple in front of you, do you try to make it more vivid? Of course not.
That's not necessarily true. I sometimes do try to make it more vivid, which is why I have bad eyesight. ;)
Quietly assert the fact in a mood of expectation until it feels and becomes "true".
I do that all the time. I am smart enough to know the theory of manifestation, believe it or not.

Ha, I am of course not doubting the smartness of your manifestation, dear Nefandi! ;-)

Yeah, I used to mess with my eyesight/seeing all the time. A lot of this whole thing is because of that - realising that surely it is indirect, and sensory experience is spontaneous and effortless. Instant vision improvement. Because you don't see with your "eyes", unless you really try to. Anyway, you get idea. It comes back to what you were saying about still feeling that there is a difference between mind and physical. Well, it's really all imagination - images arising in correspondence with imagined facts. But if so, why does manifestation tend to occur via an intermediate sequence of experiences? Because we are highly resistant to sensorily experiencing a discontinuity. Continuity of experience is a very ingrained "fact". How to break down the barrier and realise that it's all just envisioned facts within your awareness?

One way is to explore direct creation and feeling the pushback. However, that does tackle an important assumption: that we assume that objects are in locations. Actually, a location is part of the property of an object. Including the object of "the person that is you". The facts of your location is an attribute of your apparent object. And that is why attempting teleportation is a good exercise. You don't go to a new location - rather, you change the location-fact of your bodily object and your sensory experience falls into alignment accordingly. The location comes to you.

we feel like everything in manifestation needs a "legitimate" history behind it.

Things usually need to be "plausible", even if it's a really shoddy surface version of plausibility that upon investigation involves crazy retroactive coincidences.

and the "pushback" shows you instantly what you're doing wrong.

Not that you are in the wrong direction though, but that you need to be with it for a while, let the resistance unravel and your world to resettle and remain coherent. Break through aggressively and you're at risk of... breaking yourself. Good points about motivation and so on.

Location is a relative property.

Maybe that was too precise. What I'm trying to say is that location is the fact of an object, not its environment or landscape. To move something, you assign the object a new place or indeed no place at all; you do not update the inventory list of a location.

Makes sense. But actually living with the consequences of having performed this is the hardest part.

Right. Even the smallest shift can be troublesome. This is a whole other level. Say you do the teleportation exercise and the image of this room fades from your awareness, to be replaced with the image of the room next door. What's next? An important outcome is, instead of just thinking about being an aware space and all that, you will actually know as a direct fact that you have no location.

Q: Break through aggressively and you're at risk of... breaking yourself.
Yes, and while this may not be my first choice, I don't worry too much if it happens, because there are benefits to be gained from that scenario as well.
An important outcome is, instead of just thinking about being an aware space and all that, you will actually know as a direct fact that you have no location.
At this point it becomes lived knowledge. This kind of knowledge is very hard to forget or to regress from. So it's very valuable.

Right, and I'd suggest that lived knowledge is the only true knowledge. All else is thinking-about. And of course, it's not just a matter of not being located; it's a matter of not being a person. We shall see who is up for dedicating themselves to the exercise.

Q: I'd suggest that lived knowledge is the only true knowledge.
That's definitely wrong. Aspirational knowledge before it is lived, when based on proper reasoning is also true. It's just not as strongly embedded in the mind yet and is not fully matured. It's wrong to say only oaks are true but acorns are false.

I'm going to revise my statement and say "lived from". You can live from knowledge and that is different to thinking-about. Aspirational knowledge is something you live from.

Q: Aspirational knowledge is something you live from.
T-G, people don't always drop onto the path fully baked, having made all the right beginnings in the right places. This can be (but doesn't have to be) a messy process. In some cases people don't actually correctly embrace their aspirational knowledge. They struggle with it. Sometimes they live from it for a second or two, sometimes they think-about it. But however anemic and pitiful their efforts at that stage are, that doesn't make the knowledge wrong.

Yeah - Things can sound a bit prescriptive and uncompromising in these conversations, but that's just an artefact of keeping things to the point. Of course, development is often muddled and confusing and evolving - this way and then that, feeling our way along - and sometimes scary. My thinking has historically been all over the place, for instance, and I have been mostly on the wrong track. But I think everyone finds what they are comfortable with and want to "live from" in their own time. But the extent that they live from it will dictate the extent to which it appears to be true in experience. They can adopt this or that, and this or that will then be there. There's no "what we should do". I mean, there's a healthy opinion that people should live their lives fully as given, and leave the underlying patterning well alone. Y'know, just enjoy the fruits! :-) Life doesn't actually necessarily require ongoing reality-maintenance; just some occasional fantasising and an open attitude can be sufficient for most. This stuff is for when we get curious about how much tinkering is possible.

Q: Life doesn't actually necessarily require ongoing reality-maintenance; just some occasional fantasising and an open attitude can be sufficient for most.
I agree with the first half, but the second half requires some kind of objective knowledge to make stipulations about statistics. Of course we may say things like that, but you're talking to me now. I say things like that to morons who are stuck in convention, all the while knowing that there is no such thing as objective common ground and statistics.

I think having the urge to explore things as we do on this subreddit is pretty rare. By "sufficient" I mean "happy not to go deeper". Y'know, without any morons there would be no geniuses! ;-)

Q: Sometimes I wonder if I would have rather been average among geniuses. But I am not going to artificially dumb myself down to achieve that. I'd rather magically raise everyone up. I tire of myself being nearly the only one who knows anything esoteric, along with say 5 or (generously) 10 friends. This is idiotic. I want there to be millions of people like me. I want to sometimes be challenged by stuff I haven't considered yet, instead of constantly reading about stuff I thought about 5, 10 years ago and 10 lifetimes ago, recycling everything for the n-th time. I don't want to burden people with being completely responsible for supplying fresh material for contemplation. I take responsibility for that. But it sure would be nice if I came across stuff more often that let me think, "Why didn't I think of that?" So basically I want to be a God surrounded by Gods in one limitless field of glory beyond glory. Instead of feeling small and lost, I will feel like this raging radiance of Godliness will be magnified beyond compare, where each God reflects each other God's Godliness and primordial perfections. To me this is superior to the second rate situation of me being the smart one surrounded by a bunch of 2-bit idiots, which is fun for 5 minutes but gets crushingly boring soon. Well, I am still pretty social, so I am projecting my personal desires onto my ideal social environment. Maybe it's a flaw.

Maybe it's like... everyone wants to be the cool, witty, smart, attractive popular guy. But if you actually become that guy, your life is pretty boring. Everyone laughs at your jokes, is amazed by your insights, wants to spend time with you, no achievement is required... but you're basically a broadcaster or a Presence for other people to enjoy!

Far better to be a wit amongst wits, and differently so. To know the most about music, and have a friend who knows the most about movies. Otherwise, there's sorta nothing to do or explore, no adventuring to be had. Like, the world is fun to explore together with a group of equals, supporting each other in different ways, being the other parts of you. If you're King Of The Monkeys and everyone is subordinate, all you have is people aping you.

Q: Otherwise, there's sorta nothing to do or explore
I wouldn't go that far. I can explore stuff right inside my own mind, indefinitely. I'm just saying, if you can be surrounded by brighter and more creative beings, why not? It's not that they're necessary for having fun or to have something to explore. It's just a nice option.

This is your own mind.

This can take time.

Absolutely. I'm not saying this will just happen. You might need to spend hours, days. But those hours must be spent without effort, keeping the assertion below the level of strain. And there might be all sorts of patterns criss-crossing in the way. Part of the process is that these will all appear uncovered and then fade. But you don't need to do any investigation and go looking; just by keeping focused these things will come up. You "sit with them" and acknowledge them, and they pass.

In general I have an unhealthy habit of confusing struggle with directedness that is pure intent.

I was really guilty of "efforting" and thinking that was how to make things happen. Still do sometimes of course. The whole "Just Decide" thing came from that. Unhurried patience and acceptance is the way, but it's not easy to stick to. It's much easier for things that you don't need to happen. If you can get curious about the experience that is happening along the way, that really helps for me.

"And there might be all sorts of patterns criss-crossing in the way."; I don't know what you mean by this.

Oh, just all sorts of intermingled assumptions and resistances.

On a related note, there are people who can't mentally visualize.

Very true. Although I'd add: at the moment, for everyday folks. I think lots of people only have 'felt' visualisation by default. That last link pretty much describes how it was for me. It took me a long time to be able to 'image'. I could feel-know the object in a location, but I didn't really see it there. I could feel its rotation and movement though. And trying to manually "draw" the image part didn't help. The approach of 'asserting' was what got me there really, although I conceived of it as a sort of autosuggestion. I got the idea partly from a NLP story where he basically just paced/led and told them that they could see pictures vividly in front of them when they desired. And then they could. (See Milton Erickson model for the general idea.)

I figured: Why need the hypnosis aspect? All that we're doing with that is accepting one suggestion which implies another fact. Creation by implication, like in lucid dreams. I can see the world around me, in both waking and dreaming life so nothing's wrong with the "mechanism" really. Why not assert that there is a bright mental object there, which of course means it would be vivid, and let the sensory aspect come? Start with the feeling of presence, and allow the evidence to appear. Of course, different for everyone. And that is basically hypnosis by another name. Thanks for those great links - there's probably a lot more we could explore here in this area. There's a whole thing about imagination and perception in general, and "letting the world come to you" rather than striving to manipulate and control the senses, graspingly.

By this do you mean allowing the manifestations occur in a way that is congruent, as in not a discontinuity?

No, not necessarily. I mean literally not straining to sense or see things. In my thinking: Change is an indirect thing: you update the facts-of-the-world and then your sensory experience falls in line with this. Sensory experience, being a sort of 'mirage' that is based upon those facts, is something you just let happen therefore; you can't actually interact with it. For the biggest changes, you need to withdraw yourself from the current patterns - particularly, withdraw your emotional involvement (because although it's just another sense, that maintains patterns more than anything). Withdraw yourself from requiring plausibility and continuity.

That's why you should go about being 'non-attached':

- There is no solidity to sensory experience anyway; it's the image that floats above the hologram, as it were.
- While you are emotionally engaged with the sensory experience, you are grasping onto and persisting the patterns that produce it. This prevents change.

Q: Thanks, it all seems so basic when you spell it out like this, and it is. I think I need a reminder that this stuff is not totally nightmarishly difficult. If anything it's rather humorous that we are in this amazingly magical world and some of us continually get stuck in our concepts and attachments, thankfully I feel that I am getting stuck for briefer and briefer moments as time goes on.

The problem is, any indecision you have is reflected in your sensory experience. If you 'kinda think' one thing but 'kinda think' another, that muddle will muddle your experience!

That is why looking for evidence doesn't work. The world (seems to) align with your approach to it, whatever it is. There is actually no "how it really is" behind the scenes to uncover, no secret structure except what has been accumulated as patterns over time. That's where the whole "faith" thing comes in - which really means that you should ignore what your senses are telling you, and continue to assert what you desire. Given this knowledge, what seems like a good idea is to assert the most flexible worldview possible. Stop thinking about stuff (that just muddies the waters) and declare things instead. There are lots of metaphors you can adopt for this - my favourite at the moment is The Imagination Room, where the transparent floor is patterned in such a way as to filter the 'creative light' shining from underneath, into a fully immersive sensory image; change the patterns=change the facts => change the image, but you are always in "the room" no matter where you seem to be. Set aside a half hour, sit somewhere quiet, and do nothing except assert silently and effortlessly that this is a dream world made entirely from your imagination and assumptions. Just focus lightly on this as a fact, and see what happens.

...instead I imagine the within is the unmanifest void of possibility and unlimited love.

Nice also, since it has an associated feel. The reason I use the room metaphor sometimes is that, unlike alternatives such as a 'holographic aware space in which images condense' (which might be more accurate), it has a sensory aspect which can be used as a reminder: We all feel the ground beneath our feet, and whenever we notice that it can be used as a trigger to remember - "ah, the floor through which the light shines, to create my experience". It brings us back to the understanding.

I do not wish to uproot the tree...

Which is exactly fine. Power is the ability to have the experiences you desire, and what you desire is your own business. Others may crave absolute freedom from all conventions and so on, but the real freedom is to choose the conventions you like, and within those explore the possibilities.

I mean, I made this system didn't I?

You made it, but you did it unknowingly. Now you can do it deliberately and with knowledge. Instead of trying to work out what's going on, changing your mind as you go between different metaphors, resulting in an erratic experience, you can now simply select the one you like and step into that one. Once things settle, it's likely you'll just want to enjoy it. Make occasional adjustments. Always 'skipping to the final result' means you don't have the intermediate experiences. Sometimes that's good; often those experience are where the living of life actually takes place.

Do we know that I did it unknowingly? Couldn't I have knowingly chosen to forgot in order to experience it in a novel way after having built it?

Quite right, in terms of the life you appeared in, at the point you appeared in it. Plan out the obstacle course, then deliberately forget the design!

I was thinking more that, having forgotten (perhaps deliberately) your own powers of creation, you have since then been making changes to your reality without knowing it. But now you know again, you can - um - be more careful with it. :-)

For me it's the same except I retreat inward to that interior space, sort of like where the observer of all this is, almost as though he is the one exhaling out forms and ideas into his television set.

That's good. Another I've used to remind myself is "two-way looking" - placing my attention both outward into the space in front of me and inwards into the space I'm "looking out from". This makes it easy to notice that it's all floating in a big infinite space. There's a literal gap where you normally assume "you" to be. (This approach originally comes from Douglas Harding.)

A Dream

Some Dream Reminders

"In a deserted place in Iran there is a not very tall stone tower that has neither door nor window. In the only room (with a dirt floor and shaped like a circle) there is a wooden table and a bench. In that circular cell, a man who looks like me is writing in letters I cannot understand a long poem about a man who in another circular cell is writing a poem about a man who in another circular cell . . . The process never ends and no one will be able to read what the prisoners write."
-- A Dream, Jorge Luís Borges

We each dream alone.

"The world I perceive is entirely private, a dream. The world you can perceive is a very small world indeed. And it is entirely private. Take it to be a dream and be done with it. Is not the idea of a total world a part of your personal world? The universe does not come to tell you that you are a part of it. It is you who have invented a totality to contain you as a part. In fact all you know is your own private world, however well you have furnished it with your imaginations and expectations."
-- Excerpts from Sri Nisargadatta Maharaj - Part Two - also: Part One

Wherever you go, whatever you discover, it is only... more dream.

Bonus Read

Tlön, Uqbar, Orbis Tertius, also by Jorge Luís Borges, is a short story depicting an unknown country where a conspiracy of idealism takes place. Excerpt:

"They cannot conceive that space can exist in time. The sight of a puff of smoke on the horizon and then of a burning field and then of a half-stubbed-out cigar that produced the blaze is deemed an example of the association of ideas."
-- Tlön, Uqbar, Orbis Tertius, Jorge Luís Borges

...

We might also ask how our dream is formed. Patterns arising and stabilising via hypnagogia is one way of describing this. Our ongoing reality may be thought of as no more than pattern triggering in noise, feeding back on itself.

Q: Right. I'm starting to view it like this too. The fact that the forms have evolved to be this vivid, this complex, it's rather... incredibly remarkable. Remarkable. Interesting. I like to take a deeper look at words sometimes and I feel that in this context the word remarkable is interesting indeed. The forms are so interesting perhaps, that we feel compelled to "re-mark" our world with them, to recreate new and novel forms to attempt to satiate our undying appetite for creation.

Thing is, the "re-mark" process kinds happens by itself, like water waves sloshing around a tank, bouncing off each other, leading to new overall surface patterns, always changing. The difference between many traditions and the oneirosophic approach is that, where others recognise this "self-happening illusion" as ourselves but encourage detachment and acceptance, we encourage detachment and occasional assertion: a "re-folding" of the material which constitutes us and our evolving experience.

Q: Nothing happens by itself precisely because of intent. And intent is ongoing, unlike what George says. In fact you can see if this is true or not by practice. Do some eyelid gazing until the images start to form. First don't try to control the images. Then control them. You'll see how "by itself" is actually an intentional state since you can intervene any time, so when you choose not to intervene, you're still involved, and what you witness is still partial to your way of looking at and for patterns. In fact controlling and not-controlling are ultimately identical states of volition that differ only in appearance but not in substance or function.

I cover this. It happens "by itself" as in it unfolds consistently with the present state. From below, I deliberately define terms:

On terminology: "intending" is the act of imposing a pattern onto consciousness; "the intention" is the form of the pattern being imposed. If you say "my intention is..." you are saying "the pattern I am imposing is..."

So the "intention" persists and has an ongoing effect, but you are not actively "intending" in an ongoing way to make the effect keep happening. Once you've made the deformation, it persists, provided any part of the extended pattern is active. This is important: superimposed patterns apparently evolve and unfold in time even though the patterns themselves (the accumulation of "intentions") do not change. This is why there is no effort in continuing to experience the world-pattern you have set up.

Q: I'll try to explain intent in words I think will make more sense to you. Take what you call "just decide" and stop limiting it to a single moment. That's intent. Of course you can intend to go for a walk and so on, and such intents seem like actions limited to specific periods of time. But it's wrong to confuse these for the metaphysical intent. These momentary intentions for this and that obscure the ongoing ever-living intent because they make it seem as though intent starts and stops, when it does no such thing ultimately. Intent is not entirely in-time.

Take what you call "just decide" and stop limiting it to a single moment. That's intent.

It's not limited to a single moment in "just decide", never has been. The act of activation takes place at a "moment" but the activation itself applies globally over all time and space (which also means the activation then didn't take place in a "moment", but there you go). It's a pattern which is overlaid upon the whole "world-pattern". There is no such thing as a momentary intent. All intention applies to all time. To the extent that your apparent past (i.e. future recall of memories) will change in alignment with your intent. Really, you are superimposing (or triggering) patterns upon patterns upon patterns. The superposition is what gives us the "world-pattern" and the apparent temporal segment of that (again a pattern) is what corresponds to the present experience. Like Moiré patterns.

My point is: there is no in-time act. There is an illusion of an act. =

We've already covered this before, I think, stemming from: We don't "do" things, rather we "have the experience of doing". You and I need a different word for intention. I use the word "act" and "activation" to indicate a self-shifting of the world-pattern which is subsequently experienced in the observations which follow. It happens as change but it does not happen in time (because time is actually a now-pattern upon which other now-patterns are hung; it is a flat thought-structure not an environment). All that stuff about starting, stopping, moments and so on are artefacts of thinking-about experience.

I am saying the initiation (cause) is not something in-time.

Of course. Forget time. The "act" is a shifting of the whole world-pattern, which consists of all time laid out flat (for visualisation's sake). The "act" is not experienced, only the experiences associated with the shift. The "act" leaves no trace and therefore is not in time. There is change but it does not occur in time, which is itself a structure of within the world-pattern. We are inevitably bound to talk about things using language and illustrations which imply to "parts", "location", "space" and "moments" in "time". This is simply because we think by using "shadow-senses". As soon as you have divided something into concepts, you are dealing with parts, and parts are distinguished by location relative to one another in conceptual space. "Act" is maybe the broadest word. "Intending" and "intention" are traditionally good because they can't be imagined very solidly, but (as you are indicating) they can all too often be associated with the "feeling of doing" localised in apparent time.

Q: *We don't "do" things*

We do. We just don't do them as conventionally imagined. I do things all the time. I move my hands. I walk. I stop walking. I DO things. Even when I don't do anything, that's a kind of doing. But, the source of my doing is not in-time.

I think you're pretty clear on what I mean, right? For clarity: When I put "do" in quotes it is to indicate that I'm referring to the conventional usage of the word "do". Implying that the causing of experiences is not as traditionally thought; there is no cause in experience.

Q: *I think you're pretty clear on what I mean, right?*

No clue. I never understood your opposition to doing. There is a reason why I choose to say things that I say. I don't say them randomly. I say I do things because I am saying: a) I make choices, and b) I take responsibility. I say my intent is not in-time, because I want to illustrate the following: what deforms convention is not itself a part of convention. So the structure of experience becomes deformed this and that way, but those deformations don't come from the structure that's being deformed. In other words, the experience is not self-deforming. Rather, intent, which isn't exactly experience, deforms experience. Intent isn't something separate from experience, but it isn't the same either. Like white on rice. White isn't rice but isn't separate from it either. In simple language, I am beyond convention. I transcend that which I manipulate.

Another tac: "Doing" implies a there is a thing doing and a thing done-to. "Intending", by contrast, is shape-shifting of reality "across all time and space". Some of that reality might be presently sensorily "bright" and therefore a change would be experienced, some of it not. If the world was a landscape, then our usual conception of "doing" would be getting a spade and digging around on the hill of the "present moment" to reshape it. However, the actuality of "intending" is that the landscape self-shifts to adopt a new topology as a whole, and any change of the hill of the present moment is a result of this. We tend to confuse this result with "doing".

I say that experience is inert, and has no own-power. So nothing experienced self-shifts. Whatever is experienced is shifted by something that is beyond experience and beyond convention altogether.

Exactly. Experience is a byproduct. Experience isn't doing anything, it is just the part of the landscape which happens to have sensory aspects. Only the landscape shifts and it shifts of its own self.

Ping-Pong Balls Metaphor

Imagine some ping-pong balls floating in a tank of water. (In this description, the water is already in a state of motion: ripples are moving along trajectories.) The ping-pong balls are all different colours. On one of them, a blue one, you write "me". The balls float about, bouncing off each other, due to the trajectories of the waves of the water. As the "me" ball bounces off other balls, you say to yourself "I did that". However, you did nothing. Now, you splash the water. The act of splashing in and of itself produces no change to balls, however it does modify the pattern of waves. The subsequent trajectory of all of the balls is therefore adjusted. At the point of splashing, the "me" ball might be moved ("I did this"), or it may not be moved for a while.

In this metaphor:

- The water is reality (or whatever you want to call it) or consciousness.
- The waves are the world-pattern as dissolved into consciousness.
- The balls are aspects of reality which have sensory aspects.
- The "me" ball is the misidentification with certain sensory aspects.
- The collisions between balls are "events" and the collision with the "me" ball are those events misconstrued as "things I do".
- The splashing of the water represents "intending", which is to change the landscape of reality, the facts-of-the-world.

Now obviously, we're having to use time and space here in the metaphor, whereas in fact the world-pattern is "static" and more akin to a set of superimposed patterns, dimensionless "facts" dissolved into the background. However, the purpose of the metaphor is to illustrate how the illusion of "doing" is brought about due to focusing on sensory aspects and identifying with part of that.

It doesn't shift of its own. Nothing does. Things shift when you shift. Or more specifically, your intentionality shifts.

Language tangle! The only thing there is, is you. The only shifting that happens, is you shifting. Hence the landscape metaphor earlier (the landscape changing its own topology).

In your metaphor there is own-power to the system that's independent of your involvement.

No, there isn't really: because the whole system is you. It is "the current shape of you". Which is what you've gone on to say. Bear in mind the metaphor is to illustrate a certain aspect! The reality has no moving parts, strictly, because it actually has no time element. But if you go all out then... you stop having a metaphor that illustrates anything.

Now both splashing and calm represent intending. In fact, in my version of your metaphor even the existence of the water tank, water, and the balls, represents intending.

Which... renders the word "intending" meaningless. That's why metaphors involve splitting things into parts for illustrative purposes. It's the whole "everything is consciousness" problem. The ultimate truth is basically worthless when it comes to discussion. The whole universe is, in the end, your "intention" overall, since it begins with the first pattern created up until the most "recent". That's not very helpful as an explanation though, given that we aren't at this beginning now. We could call each change an "additional modification" or "an update to the intention", but most people are more comfortable with "intention" referring to a change to the current pattern. We might talk about the "overall intention" of the system, though, to make this clearer.

Intending is ongoing instead of being limited to intermittent splashes.

I think it is better to say that intention is persistent, that its effect is ongoing, because intentions accumulate (superposition of patterns) and sum to the "overall intention". Intending is better reserved for the changing of the system to a new state. To avoid words like "acting" or "doing", which automatically imply subject and object, doer and done, to most people.

If the system was me, I couldn't be anything different from that water with ping pong balls.

I think you are just arguing against the structure of the metaphor, rather than what it represents. Strictly speaking, the whole of the metaphor is "you" and none of it has solidity it has simply "taken on the shape of" the patterns involved; the ping-pong balls merely indicate the current sensory aspects.

You even described it in your own words as "everything is on its own until you splash some water." I am saying, that never happens. There is no "until" in my view.

Again, you are arguing with the metaphor's structure rather than the meaning. Experience unfolds according to the world-pattern within consciousness until the world-pattern is updated. If your arms were frictionless and tireless and you windmilled them clockwise, they would continue "forever" in that direction until you intervened to reverse them (say). That intervention would be a change of state in the world-pattern; experience would unfold accordingly subsequently. The change would not occur in time, since the world-pattern retains no state in and of itself (although an apparent past may be a part of certain patterns). The metaphor necessarily uses division and space and time, because all thought requires those things. This is why we cannot speak of the whole situation, only aspects of it, depending on what particular thing we are talking about.

Intending means whatever you find is ultimately what you intended to find.

You cannot "find" anything. As soon as you intend something, it is done. Intending a change in the world-pattern, the intention is already found. I oppose your opposition! :-)

...Heheh, you're on form today. :-)

So, if all is consciousness which is me, and the shape of consciousness is the shape I adopt, which is the shape of the world - in its entirety and not just this present moment 3D sensory aspect; I am in effect experiencing the whole of reality right now - what else is there? There is no limit in terms of the possible experiences (including not-being-a-human) in this regard.

From the POV of metaphysics this is bad view.

I beg to differ (well I would wouldn't I?). Although of course the metaphor we're discussing is very much meant to offer a practical way of thinking, for usability, as you point out. You seem to be bound to some notion of an ongoing intending when the perspective inherently dictates there is no time, and therefore no "ongoingness" available. There is only state. Of course, we can adopt any position or standpoint, and experience things relatively, but fundamentally that's the deal. The "world-pattern" does not necessarily refer to "this planet" and "this body". The larger picture is one of associative patterning. More like a "memory block" of all possibilities (logically or actually, no difference essentially).

Consciousness is only the shiny property of mind, and consciousness displays only one single version of what all it could be displaying.

We're differing on our definition of consciousness then. I've been using it to be the "background awareness" rather than the particular content or structure. I agree on potential: all possibilities are implicit within that awareness. When I say you are experiencing the whole of reality, I don't mean that this sensory experience is all there is. I mean something more like the entire "logical space" is present and dissolved into awareness, of awareness, and is "being experienced" in that sense.

But there is a limit to what you can experience at one time.

I deny this - but only in the particular sense I mean above. This is why the "ping-pong balls" were the sensory aspect and "the water" was the entire structure. The point on "human formatting" vs "dolphin formatting" is good though. If they co-exist then you aren't aware of one and the other simultaneously; one does not "make sense" within the other.

Where your view is bad is it suggests inertia as something non-volitional.

There's no inertia at all, it's completely frictionless. Unfortunately there's a lack of physical-world things that can be used as a good metaphor! You are a "frictionless material" with no inherent boundaries or divisions which can change shape at any time. Think of a donkey! That was frictionless wasn't it? Your shape changed to be (partially) that of a donkey without any effort whatsoever. Think of a running donkey! Again there was no effort or resistance. The donkey changes direction! Did the thought-donkey encounter any inertia there? No. It's in this sense that I mean it. It's a completely non-physical change (as are all changes of course).

So intent is beyond time and ongoing, both.

Messy language. It'd prefer to say "has ongoing effect" rather than say it is ongoing. The intention is static but the effect is ongoing (even though that division is obviously arbitrary and language-based).

Configuration space is implicit in experience, but most beings don't realize it.

Foolish beings! :-) All agreed on that section, although there is an "extra bit" where I'd go into the world-pattern being the entirety, and being able to dice it according to certain configuration perspectives (e.g. divide it into "moments" or... whatever). But that's just getting metaphorically out of control.

Experience is mostly identical to formatting. It's not something that arrives through vision or hearing or touch. It's not a percept. Rather, the intuition of a configuration space is concomitant with the percepts when one is wise.

I say... we are always aware of the pattern. Just because it isn't experienced sensorily (image, sound, texture, etc) doesn't mean you are not experiencing it right now. "Felt-sense", baby. And as you indicate, another word for this is "knowledge".

[There's no inertia at all, it's completely frictionless.] Then go back to your older posts and reread them.

Bah, you're wanting each metaphor to be all things, and it cannot. Each metaphor illustrates only an aspect and is always accompanied by a "but". The ping-pong balls do not wait for input; the water is already sloshing (frictionlessly) and can be redirected.

Rather the material self-shifts into patterns, but in this metaphor, the patterns have no own-being.

Of course not, but (and remember there's a larger audience in some discussions) if we cut straight to the "not-even-holographic open aware space which is inherently non-spatial and non-temporal and is empty but also full of patterns" it's not very useful, is it? ;-)

We already agree on this area anyway. The only areas we disagree are: the patterning of the world and, the description for intention/intending.

Raise your body temperature by 20 degrees Celcius, NOW! Did it work? A bit more difficult than changing your thought pattern, isn't it?

No, it's perfectly easy. I can intend this no problem. And that intention (pattern) is instantly overlaid upon the world-pattern. However, it doesn't result in a particularly strong change in sensory experience, relative to the contribution of more established patterns (i.e. body is at body-temperature), habits of the world. If I were to "forget" some of those habits then the strength of the contribution would be subject to less cancelling out. All intending instantly creates the intentional pattern and it contributes from that point onwards. The extent to which the contribution results in a sensorily significant result is another issue.

[The intention is static but the effect is ongoing] I don't agree.

Intending instantly incorporates an additional pattern into the world-pattern. The experience you have is of the entire world-pattern. The apparent level of the intention in experience will depend on the world-pattern. Like Moire fringe patterning, the intentional pattern may apparently break through into sensory experience later as patterns align or open gaps:

Reused Owl & Screen Metaphor

You draw a picture of an owl on your TV screen. It is always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day.

Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

...

Prelude

On dreaming, I think it's perfectly possible to have any experience whatsoever. Your disposition to be male is not a restriction, for instance. Nor do you have to experience a dimensional space, and so on. The threads between individual world-experiences can be narrow, and in reduced connections between patterns can make it difficult to navigate in memory between on and the other associatively. However, there is only one overall pattern and one felt-sense, because there is only one consciousness in which it all resides. The water sloshes "on its own" in the same way that if you set your arm swinging then (in the absence of friction) it would swing "on its own" from that point onwards, in experience. The experience would apparently oscillate (sensory: "arm movement") however the pattern itself would be static (dimensionless facts: "limit angle=45 degrees; period=2 seconds"). I do not associate intent with effort or bursts! How many times have I said "no effort is involved"? The shifting of a state or the incorporation of a pattern is a frictionless self-shifting which happens beyond time. There is no inertia.

Habits & Cravings

To me, habits are simply established patterns which contribute to experience. So in this regard, indeed your "maleness" may be a deeper pattern which tends to dominate your experience. Would you call "humaning" addictive, or merely established?

You description of next-step world-making, I agree with broadly speaking. When I talk of a "world-pattern" or similar, I exactly mean these established structures. Long ago (so to speak) these were shallow and malleable, but over time they have become more established. Some we recognise as obvious aspects of experience, others are more like "contexts" or "based formatting" - time and space themselves are such, as are shapes and colours, and so on. Later, we have "people" and the like. The established structures deepen and form the basis for yet more complexity. The "humanness" of experience is this formatting. The body itself isn't a part of this, but the sensory division of "a world" definitely is.

The world, the patterning or formatting of experience, is all in consciousness (what you call "the mind" but annoyingly for me that always suggests a container of some sort). A private memory-block of experience that we explore and evolve by that exploration. Observations implying facts implying observations, etc.

Intending is Easy - But

When I say that intending patterns is easy, I mean that the actual doing of it (excuse language) is easy. There's not trick to it as such. The trick is to choosing exactly what you want to happen so that pre-existing patterns don't result in, um, undesirable experiences. If you have deeply established habits (like being 38C) you're going to need to hold that pattern for quite a while and diminish the restriction. Unfortunately, breaking the habits that constitute the body might involve it dissolving before you get to your target. You're gonna need to re-conceive your body first, perhaps, as - say - a floating image with no content whatsoever. Tedious.

Yeah so - as you say - insane.

So those habits don't belong to the world, but to you. You aren't a feature of the world. The world, as it appears, is a feature of your private state, but your state isn't capable of change willy nilly. There are entrenched aspects that will not readily change until you work on them.

Completely agreed. Except that I'd say the habits are in the world and the world belongs to you. The "world" is the entire experiential environment which includes your body and all that also. All of which constitutes the private universe in you!

Don't think we need the "mindstreams" concept, do we?

...

So where would you fit intention into this? Hand that initially splashes the water?

Since the water is you and your experience, "intending" would be when you intervene to deliberately reshape yourself to a greater or lesser extent. The waves then continue sloshing, consistent with the amendment made, as if it were always that way. For instance, if you "reshaped" the waves such that a past event or fact was erased (by which I mean, a persistent aspect of the pattern which is influencing the current sloshing) then from that point onwards it would never have existed; there would be no trace of the former state. If you were to completely calm the water, you would be restarting experience from scratch, a new universe emerging from minor random background fluctuations.

So in this metaphor, the surface of the water is consciousness - and there is nothing else except for that surface (no depth to the water below and no extent to the surface above). And we can see that there is no definite permanent "past" or "memory" of any previous state of the surface as a whole, because we can choose to deliberately amend or delete any residual patterns (echo ripples) from existence, via intention.

EDIT: On terminology: "intending" is the act of imposing a pattern onto consciousness; "the intention" is the form of the pattern being imposed. If you say "my intention is..." you are saying "the pattern I am imposing is..."

I suggest maybe:

The background of consciousness is never completely empty of patterns. It is eternal. So in fact, all patterns are present and "dissolved into awareness" awaiting triggering.

Babies aren't "new things" they are "new experiences", however the patterns which become layered and emergent for those experiences have always been there.

Drinking the Transcendental Idealism

I've been reading up on Immanuel Kant's concept of Transcendental Idealism and I'm finding it quite an appealing take on the "world as mind-formatting" view. The exact interpretation of Kant's philosophy is still debated even now. With the ideas of Oneirosophy in mind, though, I'd say it takes on a clearer shape than it might otherwise. The essentials are: We experience the formatting of our own minds; sensory experience is not what things are in themselves; even time and space, cause and effect, are something we bring to experience. That we apparently share a similarly ordered world - what Kant calls empirical realism - is down to our minds being similarly formatted (as "human beings").

Kant at the Bar: Transcendental Idealism in Daily Life over at Philosophy Now (see EDIT) is quite a nice overview of Immanuel Kant's metaphysics, in a breezy read. Although I'd say it makes an error by referring to "the physical data our senses receive" at one point, for instance, it's pretty good at covering the basics.

Meanwhile, from the Wikipedia entry:
The salient element here is that space and time, rather than being real things-in-themselves or empirically mediated appearances (German: Erscheinungen), are the very forms of intuition (German: Anschauung) by which we must perceive objects. They are hence neither to be considered properties that we may attribute to objects in perceiving them, nor substantial entities of themselves. They are in that sense subjective, yet necessary, preconditions of any given object insofar as this object is an appearance and not a thing-in-itself. Humans necessarily perceive objects as located in space and in time. This condition of experience is part of what it means for a human to cognize an object, to perceive and understand it as something both spatial and temporal. . . .Kant's view is better characterized as a two-aspect theory, where noumena [world as it is] and phenomena [world as sensed] refer to complementary ways of considering an object.
-- Transcendental Idealism, Wikipedia

The Stanford Encyclopedia has more coverage in its Kant article here, however much of the discussion is based upon interpretations other than the "two aspects, epistemological" version which I'm inclined towards.

EDIT: Turns out the Philosophy Now article is for subscribers, but Adblock suppresses the block rather transparently. If that doesn't work for you, see in the comments instead.

...

Q: Kant was close to figuring shit out. He made a few strange steps that I'm fairly comfortable dismissing, but he was pretty close, and this is one of my favorites of his and something I referenced in that essay I wrote.

Space and time as a priori conditions for experience is really interesting to play with, and of course you'll find it's impossible to imagine anything non-spatial or non-temporal, so this conclusion comes fairly naturally to anyone inclined toward any variant on idealism. And the important implication is that space and time are neither properties -nor- substantial entities. So they're subjective, they're part of -you-, not anything apart from you.

And I think the idea of space and time being -you- is something which was kind of skipped over by... the thousands and thousands of Westerners who have studied Kant. Either because it wasn't processed fully, was ignored as crazy, or just found a niche in an otherwise mundane worldview they held.

Another thing to take away from this is the fact that there are some Western philosophers who actually do have some ideas to offer, and are worth considering. I've learned a lot from Western philosophers, even if I had to filter a lot out as well. /r/oneirosophy might benefit from a bit of a book club where we discussed some texts apart from those we compose ourselves. I've certainly arrived here only through the likes of Kant and Hanshan and the suttas. What reason do we have to think we all wouldn't benefit from discussing some texts like those?

Good points.

Kant was close to figuring shit out.

He may even actually have sussed it all out but been unable to convey it in the conceptual culture of his time. Definitely, I think many of the problems with Kant are problems of modern (and contemporary) interpretation. That time and space are basically part of the "senses" is a vital component. I can see how it got overlooked, because I think people never understood that this moment right now, in consciousness, is sensory, that there is no spatially-extended unfolding world beyond it that you are exploring. The facts-of-the-world are dimensionless. Instead, they tended to think of "this" spatially-extended world and then another world which was the source of that one. Getting that wrong leads to confusion about there being two things, or two aspects of one thing, and so on.

Another thing to take away from this is the fact that there are some Western philosophers who actually do have some ideas to offer, and are worth considering.

Things get lost to history too. In the early part of the 20th century, authors like E. Douglas Fawcett (The World As Imagination) and JW Dunne (The Serial Universe) were popular - particularly the latter, whose An Experiment With Time was well-known and influential. Such books are full of ideas of static time, collapsed space, and the observer as a consciousness who brings the dead world into 3D/4D life. Those ideas were the Brief History of Time of their, um, time. Really, insights just get rediscovered for modern times. Fashions of understanding come and go, based on power-struggles rather than correctness. Theories die and are forgotten because their proponents die and are forgotten. We not on a grand march of progress into the future. It may be that, since these metaphysical worldviews give power to every individual, they are naturally sidelined by parties who have certain economic interests at heart. Not in some sort of conspiracy, just that you pick the worldview that matches your desires, you then tend to promote that worldview, and when you become dominant in society then that is the worldview you will make dominant via education and law-making.

a bit of a book club

It's a nice idea. Maybe suggest it in a separate post. Historically, though, these things tend to lose momentum if too onerous (see /r/OccultStudyGroup for example) so would need to think of a good way.

Q: That time and space are basically part of the "senses" is a vital component. I can see how it got overlooked, because I think people never understood that this moment right now, in consciousness, is sensory, that there is no spatially-extended unfolding world beyond it that you are exploring. The facts-of-the-world are dimensionless. This also jives with the "interface theory of perception" by Hoffman.

It's a nice idea. Maybe suggest it in a separate post. Historically, though, these things tend to lose momentum if too onerous (see /r/OccultStudyGroup for example) so would need to think of a good way.

I'm not a huge fan of those because you either need to have read the book in question, or take it as homework, which isn't always enjoyable. And some of the books people want to talk about are huge and difficult, and are no easy task to read. It's not like reading cheap science fiction when it comes to some of these books. They're mind-benders that sometimes make it slow to read them.

I think the best way to do those is informally, once in a while, impromptu. So if /u/Utthana feels like talking about a specific book, he should make a post about it, ideally with a link to a free copy of the book so that interested parties can read it, pick a quote from it and put the quote in, then type some kind of response or a reaction to the quote, and ideally say something that could inspire or provoke further discussion. Then I don't see a problem. Just don't expect everyone to join in, because not everyone has the time or energy to commit to every possible book. But in some cases you may meet people who've already read your book and are ready to talk about it, so then, why not talk about it? Seems fine.

Agreed on the book thing. Good observation about Hoffman connection - yes.

Q: Just for the record I want to mention that Kant's brand of idealism cannot be called "subjective." So Kant's idealism is not quite what I would call oneirosophy-grade. I think Kant believed that his mental constituents were in some sense given to him from on high.

Hmm. I think it's open to interpretation a little (there being at least three contrasting ones). In my reading: The phenomenal is subjective, however he then suggests our "formatting" is the same, hence we have similar experiences (an intersubjective "empirical realism"). Not because externality exists in that way, but because we are that way. This accounts for other people reporting similar experiences - but it doesn't necessarily need to imply that there are other people in the sense of multiple formattings. It can be one formatting, one experience, multiple perspectives. There doesn't need to be simultaneous distinct observers. But yeah - I think overall it's a nice description (because of its handling of space and time), but as always we take the useful bits and adapt them, put aside the rest.

Q: What I am saying here is that I don't think Kant believed his personal will had 100% scope over the experience. In subjective idealism will and experience are matched 1/1. In other idealisms will is adulterated by outside factors, even if it's all mental. In other words, subjective idealism is the only kind of idealism where your mind really is your own.

Right, the influence or connection between experiencer and formatting isn't really pursued, as I understand it. It might equate, but it doesn't recognise that we can manipulate (really: reshape).

Q: It might equate, but it doesn't recognise that we can manipulate (really: reshape).

The situation is far worse than this. It's not that we can manipulate. We can't avoid manipulating. Drastically stronger claim. And Kant is not pursuing this at all, because Kant is not a yogi or a tantrika or in western lingo, a wizard I suppose. As near as I can tell our choice is to manipulate unconsciously or to manipulate consciously. But non-manipulation is not on the menu.

Maybe say knowingly or not, rather than consciously? It's not that we are doing something we aren't aware we're doing, it's that we are doing something but aren't aware of its impact. (i.e. That all imagining establishes patterns which shape subsequent experiences,)

Q: Maybe say knowingly or not, rather than consciously?

Sure, that's fine.

It's not that we are doing something we aren't aware we're doing, it's that we are doing something but aren't aware of its impact.

What you say is I think somewhat right, but there is also a lot of non-awareness, so "unconsciously" is also a good word. Then once you're conscious you're doing it you can still underestimate the impact.

Also, many people don't realise that "feeling" is an imagining too, which triggers its associations. So for them that does seem "unconscious" - so perhaps there are two areas to highlight: doing stuff without realising the impact, and also not realising you are doing stuff.

True Will & Subjective Reality

In the magickal writings of Aleister Crowley and Thelema, the concept of True Will - appears - fundamental:

The ultimate goal of a Thelemite would be to understand and perform their True Will. The concept postulates that each individual has a unique and incommensurable inherent nature (which is identical to their “destiny”) that determines their proper course in life, that is the mode of action that unites their purest personal will with the postulated course that preexists for them in the universe.

The idea is that to the extent that one is pure in their will, one is carried along effortlessly by the momentum of the universe like an expert sailor allowing the current to carry the ship along its intended course with minimal effort.

In Crowley’s ethical treatise Duty, he identifies True Will with the Nature of the individual.

Could we call this "what we really, really want" vs what we think we want, perhaps? In his book Head Off Stress architect, author and mystic Douglas Harding put it:

In fact we can distinguish three areas of intention or will: (i) what you think you want, (ii) what you really want and (iii) all the rest, what you're up against, what the Universe wants. Now if it should turn out that this third and immensely larger area is what you really, really, want, and you not only contain the world but intend the world, that you want it all - (i), (ii) and (iii) - to be just as it is, why then you would be happy indeed. If you were wholeheartedly to choose the whole lot, all your stress would be laid to rest.

Unrestricted Freedom? Going With The Flow?

If waking life is an unbounded dream in the same sense as a lucid dream is, then our ability to create change in line with our ego is unrestricted. However, if there is some deeper structure to us - that what we might like to do isn't necessarily what we should do in a more fundamental sense - there may be limits, due to a pre-existing momentum. We might in anger want to tear up the world, say, but that desire is actually an indication of our sense of separation (not truly feeling at one with the rest of this 'dream') and so is not our True Will; we will not be successful in having strong results in that direction, results that persisted. Similarly we would only be able to resist certain actions and paths for so long, before we were "made" to follow them or do them. The universe would play nice with us initially, but eventually get impatient and nasty - - -

An analogy might be that we are whirlpools in the river who can by force push ourselves in any direction, but it's always going to be easier to follow the rivers path. Or waves in the ocean born with a momentum in a certain direction, with our power only being to tinker with the details of the path and the amount of suffering along that path.

A main concern would be one of listening and paying attention as well as directly manipulating, to try and pick up on this 'momentum' - because a with-momentum route would be the most efficient and most likely route to succeed.

True Will: True in Experience?

In your experiments with magick and subjective reality, have you found any problems getting what you "want" vs what you "should do", or a sense of a direction that things want to go in? Or do you see this as a completely flexible reality that the observer can potentially direct in any way they want? Have you come up against, or benefited by recognising, such a thing as 'True Will'? Or is it just a morality-based, human-centred concept with semi-religious origins?

...

Q: good to see some thelema being brought up here, i was hoping we could get some western mysticism in here. And to your question i have noticed there is a kind of resistance from the universe to get what you want versus what you should do. But i have found that depends what part of the universe you ask for these things. If you are in tune with the more angelic energy it wont necessarily give you what you want but it will give you the essentials that you need because it wants to make sure you dont interfere with the aspirations of your higher self. If you are in tune with the demonic it will give you exactly what you want, but this is dangerous because the demonic doesn't care if your wish is actually harmful to yourself or detrimental to your bigger goals. For example if you ask angelic entities or energies to help you find a mate, they will first turn you into the kind of person who can have a healthy relationship before making it happen, where as demonic entities or energies will give you some one even if you are clearly not ready yet and it may mess up your life. So demons answer want you want where angelic entities give you what you truly need or should do. I dont know whether or not you guys like the idea of external deities, you can think of it as certain parts of yourself, but thats the best way i can frame it for now.

Interesting. I guess you could look at the "angelic" path as a request with the flow, and the "demonic" path as a forcing. And it does highlight the problem that, if you try to work out by surface thinking what you want and how to get it, then it's not possible to anticipate the subtleties. Only the larger universe can take that into account. So angelic=grounded/wide view, demonic=ego/localised?

How do you think of "external deities"? If we're talking subjective reality then "everything is mind", supposedly, however some things are perceivable within our 'phenomenal space' and others are not. External deities tend not to be (although this isn't hard-line). Hmm. And what does "bits of yourself" mean in subjective reality?

Q: im not really sure how i perceive these beings because although i am a subjective idealist, im not certain on solipsism or which degree in which to apply it. My experience with working with spirits is that they are higher dimensional beings in the literal sense, or as personifications of base energies in the deeper universe, hence why people have different experiences and interpretations of them. Of course maybe internal vs external is a duality altogether and even if you say everything is internal you still imply the existence of the opposite of external like up versus down. So i would say they are both external deities and internal aspects of our deep inner minds simultaneously.

Simultaneous, yes. My stab: We can follow subjective idealism without solipsism if we recognise that what "we" identify with as a person is a "dream character" and that is of no greater or lesser status than the other "dream characters" we encounter. In this sense, everyone is a part of our larger selves (the whole world). Then, spirits can be seen both as external beings and as aspects of ourselves - as can everything/everybody else.

I think paying attention is key in order to learn one's intentions.

That's what I was getting at with the "listening" idea and of a "momentum". If this is "all you", then maybe the whole thing is your True Will. Although you might try and fight against it (that momentum) out of ignorance if you aren't paying attention and don't recognise it. (So that would be about finding and eliminating resistance then, I suppose.)

Q: The way you formulate it is not good because it can easily make people think that the status quo is our True Will in some way that we can't do anything about. This universe of limitations is our True Will, but when we rid ourselves of the universe as it is known, that too will be our True Will! Now, if you say it like that, there is no chance of getting it wrong.

It's not an easy thing to formulate really. Essentially, we are talking about our Nature. There are things you want and things you don't want. There are things you don't realise you want or don't want, because you are not sufficiently aware of your true identity. As you become mindful of your thoughts, your body and the environment and its ground (of everything) then you know. The universe (the content) always moves in (or attempts to move in) the direction of this fuller knowledge, whether you yourself are aware of the knowledge or not. Which is why releasing blockages, etc, is part of the process, in addition to any magickal/intention techniques. You can always have whatever you choose, but do you really want it?

This universe of limitations is our True Will, but when we rid ourselves of the universe as it is known, that too will be our True Will! Now, if you say it like that, there is no chance of getting it wrong.

There's a whole debate on what 'True Will' means in Thelema, because 'will' can be thought of in different ways, but the conclusion is probably 'True Nature', which keeps it away from individual acts of will.

"which keeps it away from individual acts of will." Which is both sad, and imo, not Thelemic anyway.

It's an attempt to separate the vague notion of "free will" (that you can do anything you want, including go against your own desires) with your God-like Will. But then, if you act against your desires, that's still your God-like Will surely! I'm undecided on the best way to think/talk about it. Maybe it's just because two worldviews are being mixed together.

I tell you what I feel when I interact with you. I feel like lots of times you keep me down, you keep me ignorant. But first I have to knock four times.

Really? It's not intentional. Usually I'm just 'feeling out' the best way to write things that I know non-verbally. I let this stuff slide for a while, so I'm kind of rediscovering some aspects as I go, and converting it from how I used to describe them, and realising new stuff along the way. Also, I find that I'm often not clear initially what you mean because you think of things in quite different terms from me, until I get the "a-ha" moment: that corresponds to this, okay. For instance, the "enfolded/unfolded" stuff, and use of the

word "universe", it just takes a few spins round to get us talking about the same thing, and then we make progress and things speed along.

Duh. :) Godlike will is not limited in any way.

Yeah, but you see what I'm getting at? Of course, everything we experience is because we create it, however we can deliberately will for things from ignorance, because we don't know our true selves well enough (beyond simply intellectually knowing it). Just because we are God, doesn't mean we are completely conscious of ourselves, due to limited attention. We can Will from the perspective of God, or Will from the perspective of an individual. That's why there's a point to doing exercises for awareness and so on, so that your perspective becomes more and more God, less individual, and so your intentional meddling becomes closer to "God's Will" rather than "ego/individual's Will".

Is it possible that in an effort to take my own assumptions as your starting point, you actually downgrade my view? As in, you think I hold assumptions which it turns out, I do not?

Hmm, perhaps. But I think it's more that it takes a while to understand what you're getting at, in my own terms. I could just write a screed in my own terminology I suppose.

Yes! But remember with that stuff, it turns out later that you understand that super-order is not possible ...

Well, there was a super-order, then a super-super-super... until infinite granularity.

But you were spoon feeding me assuming I am an idiot.

No, it's just how dialogue works. I talk about "implicate/explicate" as my basic explanation, we get on the same page, then it's like "wouldn't there be a super-order or not", well yes-but-no in the limit. Limitless potential, yes, but it matters that it's folded inside the current experience, and you only get that if you go through the steps (otherwise you have a need for an external 'observer' to keep everything existing, all that). Really I am just 'replaying' how I went through it myself, I suppose, prompted by the discussion. If was writing a post or essay, then that's different, because I'd think the whole explanation through first.

You assumed I was average, that's why.

Hardly. You seem to have a great handle on this stuff, and coming from another direction, so I get a new way of seeing it I wouldn't have thought up myself. You are also much more direct/ambitious with it than I would think to be, which is great. Pushes it along. If I've come across as condescending or something, I really apologise! I don't see this as explaining, I see it as exploring.

So we can make mistakes, but it's our sacred right to make mistakes.

Yep.

Only if you say "I am God" will you be right.

Agreed. It's like "you are the dream" vs the "dream figure" or even "all the dream figures" or even "all the things in the dream".

Only when you do it. I do better than you. I go faster and I am more direct. As a result I don't waste time and I tend to end up with amazing results.

Well, good for you then! ;-) Although from my perspective you jump to conclusions - or rather, attractive viewpoints - without building towards them. If we don't do the steps, then it can become more an act of faith. That's why we need to do some exercises/experiments. In truth, "waking life=lucid dreaming" is a hypothesis that needs testing. That's why I wrote the True Will post: what are people's actual experiences, separate from what I want it to be like?

Precisely. Why build? If someone is lost, they can ask a question.

That's easier in a one-on-one context, rather than over comment threads. Having said that, we approached real-time so it was probably less of an issue!

In your True Will post you were suggesting that the universe offers a pushback of some sort... suffocating fatalism...

Yeah, that post was a prompt. Regardless of what I think, what do people actually experience? And how does that correspond to their progress? In the post I included three links to different interpretations of 'True Will', to keep it broad. I didn't want to defend a position, I wanted people to tell me if they experience pushback, and what they attribute it to if they do. (Be that the 'universe', bits of 'themselves' that they haven't integrated, lack of confidence, misidentification.)

Yeah, I have what I think is how it all works. But we don't generally have complete freedom, because we are fragmented. That we can requires some work, some exercising. You'd agree, surely? Bold confidence and expectation can work wonders, but I still ain't teleporting about the place, y'know?

Listening is meddlesome. And manipulation is effortless.

Listening is a creative act (whether it is perceive something apparently persistent or not), but if the intention in listening is to hear what your 'larger self' has to say - by which I mean, the bits you've not yet expanded to include - then that's what you get, right?

Until we're actually fully expanded, and directly experience ourselves as everything on a constant basis (rather than just 'know' it) there is still going to be the sense of an apparent 'other' to our 'self'. Dunno about you, but I am not constantly identified as the "the background awareness" quite yet...

That post was a turd.

Heh.

Then why was there so much leading material?

Ya gotta frame it. I present the idea, the implied challenges, which is one of restriction, or at least one of optimal path. And really, I don't know if we are restricted or not. I have had some experiences where 'this' was the thing to do; I was told.

I wouldn't say "fragmented." In my lucid dreams I feel the world as just as external as I feel this world here. But I can still manipulate it freely.

That is a good point. But this is about knowing. When you truly know something, rather than think it, I find that I feel that truth. In fact, at the point of lucidity (assuming I didn't enter directly), that is the sensation that changes. And when I get those 'Dream Yoga' moments out and about, it's the same: the nature of the experience changes somehow. 'Feeling' isn't perhaps the best word, because I don't mean a bodily feeling or an emotion - it's a felt-sense or felt-knowing. It's the difference between definitely this is transparent like a dream to just seeing it that way mentally. That's what the expansion-type exercises are about; reaching out to that. (The 'looking inward' thing gives you the same flavour though, at least as a starter.)

Why did you frame it with so much fatalism?

It's not actually fatalism, it's presented (from sources) as a 'higher path', and an optimistic thing to strive for: alignment and effortlessness. But there is a negative aspect to it, if you just want a wide-open dream, if there is a pre-existing direction to things, which is what is implied.

Leaving suggestions only as suggestions I am supremely honest with my experience. I can't report a suggestion to be something other than a suggestion and remain honest. To report a suggestion to be something other than just a suggestion is a speculative act.

Yes. This is the essence of reflective experience, acknowledging the transparency.

We aren't restricted by anything substantial or external.

No, not substantial or external, there is no evidence for that. However, the restriction doesn't take the form of an underlying substance, if it exists, it takes the form of not being able to simply adjust your experience to match your intention. And for whatever reason, people report that you can't.

Felt-sense or felt-knowing... I agree.

I think this felt-sense in combination with knowing 'where to look' is fundamental to the endeavour. The idea of a felt-sense/known is pretty alien to most people, although some related work has been done in psychology that almost gets there by Eugene Gendlin, which has a philosophy based on 'implied steps' and unfolding.

It isn't likely to be transformative.

When people hit 'realisation', is it transforming or is it discovering? The effortlessness is that of following the path revealed once blockages are cleared, not just an 'avoidance of discomfort' path.

That wasn't clear to me in your post. While you weren't talking about substance explicitly, the wording you used was highly suggestive of it.

Hmm. I could have been clearer then.

In other words, you can't intend to be a well-adjusted member of society and also omnipotent. These are mutually contradictory intentions.

Yeah, I know what you mean. I just saw Lucy. But, I don't see why you can't flip between the two, or create two perspectives at once. In fact, you definitely can, if it's to mean anything at all.

From my POV, if you discover something, but it changes nothing about your experiencing and it doesn't introduce new capabilities into your life, then you didn't discover anything, or you discovered something in name only.

I'd say you discover more about your true self, which is transforming because your subsequent thoughts, actions, experiences and so on will now be informed by that expanded identity.

So what I am saying is, you can do anything, but it tends to have implications and consequences. If you're flipping here and there, it implies a lack of commitment.

Commitment is important, it's true. Maintaining parallel perspectives is probably not very meaningful other than a fun experiment to try.

... and be visible to others.

What others?? :-)

Q: *What others?? :-)*

I meant your ideas of them. Not genuine others. Like dream people or the people in your hallucinations.

Of course. ;-)

Super-Simplified Models of Reality

One of the outcomes of Oneirosophy is that, since all experience is effectively dreamlike and is you, we recognise that models of reality are pretty arbitrary and pattern-based. However, we do usually feel we need of some model or metaphor in order to contemplate and direct our experience. And indeed, it is discovered that a fully absorbed model itself behaves as an "active metaphor" which shapes our experience. I was briefly musing about what the most basic but useable version of my idea of reality would be, ending up with the text below. What are your own "super-simple" or "rule-of-thumb" models?

TG's Super-Simplified Reality Model™

Think of yourself as an open holographic conscious space.

- All patterns are present right now and active right now, dissolved into this space.
- Nothing is hidden or elsewhere; such patterns are simply not activated at an intensity level that is noticeable.
- Meanwhile, there is no time or space, other than as a formatting pattern.
- All content is ‘imagination’.

To bring something into experience, we imagine or recall that pattern. We do this simply by intending to do so. Everything else is then completely automatic.

- The first step is to decide to enter a state of detachment and absolute allowing. This is to cease the re-activation of current patterns and allow them to yield or subside.
- Optionally, one may also spend time imagining an open empty space, in order to clear oneself of residual experience.
- From then on, one does intending-imagining to trigger experiences you want to have.
- Our identification should be with the open space, rather than with any particular piece of content that appears within it.

...

I like that you put a trademark this time.

Haha, well Nefandi and I were joking about my particular turn-of-phrase, so I thought I'd make it official. ;-)

Your observations on language and socialising are spot on. The hurdle they produce is that the language implies and triggers a being-a-person pattern (felt boundary and location) but it also directs and narrows your attentional focus. A useful way around this is to adopt the idea of "letting the world come to you". Rather than focusing in on things with one sense or another - e.g. "concentrating on what someone is saying" - sit back a little and have perception arise by itself. This will feel different to your usual mode: rather than (say) grasping for seeing, and therefore seeing images, you will tend to perceive objects and meaning, without effort. This is great for eyesight improvement; a related article can be read here.

*Q: I couldn't find the exact link but I had it saved in a word document (that's how good it is people!)

Daily Releasing Exercise

- Twice a day, 10 minutes, lie down in the constructive rest position.
- Completely let go to gravity. Give up totally, play dead.
- If your body moves or thoughts come up, let them be. Just let them release without interference.
- If you find your attention becomes focused on something, the same: just let go of your attention. Give up, again.
- At the end of the session (don't worry about exact timing), decide to get up, but don't make any movement. Wait until your body moves by itself. This won't happen for a while, but during one session, it will.
- In general, resist the urge to interfere with your body and mind, to push it along. Settle back and let it run at its own pace.*

That's the chap!

It's basically the passive version of Overwriting Yourself plus the experience of Just Decide. It's simple and effective. It feels good and it involves nothing more than not-interfering, so no excuses!

[POST BY Nefandi]

1. It's hard to say this is some kind of final version of what I use, but here it goes: Possibilities are limitless. All conceivable and a vast array of currently inconceivable states of experiencing are possible to attain and maintain indefinitely.
2. Manifestation = current intent - prior intent.
3. Intent (or will) is always effective, even if there are no currently visible effects.
4. Intent is structured conceptually. Conceptuality is neither evil nor something one could rid oneself of, but if one fails to understand the nature of conceptuality, there is a possible downfall there.
5. Everything matters because everything is effective, provided it's still supported by your will in some way. That tiny mundane memory from 30 years ago? It's still affecting who you are today and it even affects the quality of your meditation. If you don't like this, you have to transform your memories, or their meanings. If you leave things at status quo, expect their effects to last indefinitely. Thus, even stupid and mundane events from 10 lives back can be affecting you today. Good news: nothing is lost. Bad news: nothing is lost. Good news: everything can be transformed. Bad news: things don't necessarily transform of themselves, so passive waiting is often a waste of time if transformation is what you want.

And then I always reflect on my value ladder:

1. Wisdom.
2. Power.
3. Compassion.
4. Imagination.

In that order of importance.

[END OF POST]

That's a nice summary, especially the note about memory.

Outside: The Dreaming Game

BACKGROUND: A description of an exercise I originally came up with elsewhere, but I think it could be useful to folk here too. In subjective reality, we would be both the player and the creator for the content.

Inside Outside: The Game

If everyday life were an apparently massive multiplayer video-game, then dreams would describe how the mechanics of such a game, which is called Outside, operate. (See related subreddit which expands on this concept.)

You are not actually the character you play in Outside, rather you are an open "game-space" which connects to Outside and adopts a particular perspective in the Outside game environment. In periods of reduced activity, your "game-space" disconnects and either connects to another pre-existing game-world, or constructs one on its own, seeded by random data fluctuations. You can see this happening in the case of hypnogogia and fragmentary imagery. Generally these worlds are more flexible than Outside, because to save on processor and memory power, all games function on a co-creation, procedural expectation/recall-based engine - so the more players there are, the more stable a game world becomes. Because Outside is the main, default subscription for all current players there (part of the terms and conditions), you always reconnect to Outside whenever other connections collapse.

Outside Inside: An Exercise

You can prove this to yourself by trying to observe the disconnection/reconnection in progress, or illustrate it via a thought experiment, to be done '1st person', as if you are having the experience:

- Sit comfortably. Now imagine turning off your senses one by one:
- Turn off vision. Are you still there?
- Turn off sound. Still there?
- Turn off bodily sensations, such as the feeling of the chair beneath you. Uh-huh?
- Turn off thoughts. Where/what are you now?
- Some people are left with a fuzzy sense of being "located". This is just a residual thought. Turn that off too.

You're still there, you realise; you are a wide-open "aware space" in which those other experiences appeared. Outside is the generator of those experiences, including the body and many of the spontaneous thoughts and actions. Only a subset of change: intentional change, is actually your influence. The rest is just part of the game experience. There are rumours of players who have developed limited, dev-like "magickal" powers based on "intentional" procedures, but since these would also produce a revised game narrative to cover their tracks - 'narrative/experiential coherence' is enforced religiously by the game engine - this is hard to confirm. When you eventually complete Outside, after the final montage sequence, the connection is terminated and the 'world' within you disappears - followed by your next adventure, should you choose to accept it!

EDIT: See here also for a good article and a couple of comments which point out the "dream-like" nature of subjective experience.

...

Q: Intention is just the preprocessor for rendering

In a game-world defined by belief, expectation and accumulated knowledge.

There are as many people in dreams as in the waking experience, so that theory is wrong.

Some dreams. Some dreams are just you. Some dreams are lots of people. Stability seems to vary accordingly. But, y'know, it's all open to experimentation.

If that's true, you're a victim of the Outside.

Outside turns out to be your 'larger self', the dreamer, the dream - of course.

I think if the differences exist in how populated the environments appear, they are not big and they vary from person to person.

True. It varies. There's definitely some "conceptual momentum" in more populated dreams/realities.

So why keep it a secret until later?

Because that's what the world does.

Although to be clear, from evidence alone the world appears within you. The 'space' is your larger Self, the content isn't necessarily authored by your smaller self alone. It's co-authored.

From experiments: waking, lucid dreaming, OBE, it seems that there are persistent worlds that you are "tuning into", dreams where you are sole creator, and waking life... which is co-created more stably than most. In effect, there is only one creator (Big Self), but there are many apparent small contributors (small selves).

Q: *Although to be clear, from evidence alone the world appears within you. Only if you look very very carefully. :)*
The 'space' is your larger Self, the content isn't necessarily authored by your smaller self alone.

The smaller self is authored by the same force that authors the so-called "outside." The smaller self doesn't actually author anything and has no independent motive force. This independence of will is falsely imputed onto the body and the smaller self. There is real free will, but it's not centered in the human body or around it. In effect, there is only one creator (Big Self), but there are many apparent small contributors (small selves). I agree with the first half but disagree with the second. There is only one creator, the big self, and you are ultimately that big self, end of story. You're not actually TriumphantGeorge, you only play one on TV. From experiments: waking, lucid dreaming, OBE, it seems that there are persistent worlds that you are "tuning into", dreams where you are sole creator, and waking life... which is co-created more stably than most.

I think it's better to say we get tired of grasping onto this style of experiencing and detune. So it's not so much as tuning into other realms of being, as detuning from this coarse experience. Upon detuning some quite random and often nonsensical dream takes place. Dreams can be made less random, more meaningful and more sensical, but as I see it, that's not the norm. Dreams can eventually become acts of consciously tuning into different realms, but by default they're what happens when our white-knuckled grip can no longer hold this experience and we fall away from it exhausted.

Agreed with all. It's about levels of explaining.

You're saying the dreams where more people are present tend to also be heavier, more solid, harder to modify when lucid in them?

That's my experience - but it could be down to my own expectations and theories! :-) Just more stable in general, less fantastical and random. I can still overcome things, but the background is far less flaky.

Q: *That's my experience - but it could be down to my own expectations and theories! :-)*
Interesting. It's always fascinating to hear about how other people dream. I used to assume everyone's dream contents were roughly the same, but I've come to realize: not so.

Yes, me too: I think lots of hidden assumptions may subtly come into play. Perhaps that's why dreams are a good insight into underlying beliefs?

Q: *In periods of reduced activity, your "game-space" disconnects and either connects to another pre-existing game-world*
Is that pre-existing game-world another person's dream? Or a realm that multiple dreamers visit? Or none of the above?

That multiple dreamers visit, that was perhaps seeded by a single person at one point, but other came to occupy. Sometimes you might find yourself being a pre-existing character, looking through their "viewport", sometimes you might just appear as "yourself". Sometimes you might accidentally find yourself in a world like this, with a complete history, and be the only visitor with knowledge. Depends on the nature and flexibility of the environment. All worlds persist to some extent after creation, although they may gradually fall apart through lack of intention/expectation.

The First Tulpa

Introducing Tulpas

According to the definition at the /r/tulpas subreddit, a “tulpa” is an imaginary friend which has its own thoughts and emotions, and that you can interact with. It is an apparently independent consciousness existing within the creator’s mind. It has its own opinions, feelings, form and movement. It is an additional “person” within your consciousness. Tulpas are created deliberately, but can arise accidentally.

Deliberate Tulpas

Deliberate creation involves regular forcing, where the host deliberately visualises and interacts with the expectation of the presence of the tulpa - implicitly seeding it by giving it attention and expectation. At some point, the tulpa develops sentience and begins to act of its own volition. Another aspect of tulpa creation is the development of a mindscape or “wonderland” - basically, a persistent mental environment where the host and the tulpa can interact and explore together, without having to “overlay” the tulpa over the everyday world experience.

Accidental Tulpas

An accidental tulpa, such as a childhood imaginary friend which may persist into adulthood, does not arise by deliberate forcing. How does such a tulpa come to be? Perhaps by expectation and implication. The child's need for company and exploration of itself via another implies an additional consciousness with which to interact. Alternatively, it may be that the development of the child at an early stage involved the creation of multiple sentient aspects, of which one became primary.

The First Tulpa

As a child, we are passive and receptive. Over time the actions of others towards us implies that we have a sentient personality - that we are a "person" or have a person inside us. Responses are expected of us that align with this notion. In short, the world around us forces the empty mind to come up with a sentient personality in the same way as we might force a tulpa. In fact, oneironauts all know that the “person” they experience themselves to be is not who they really are. I am the awareness in which that “person” resides. The “person” itself is in fact nothing more than a tulpa: the first tulpa, which we confuse as being ourselves. [1]

And what of the world around me? It seems stable enough, a persistent environment where the person can interact and explore. Like a “wonderland” for the first tulpa, in fact:

A mindscape/wonderland can be imagined in such a way that large areas of it are undefined or lack clarity. Traveling within the environment outside of areas you've consciously defined can lead to a subconscious, dreamlike generation of environments and landscapes. This has been known to provide interesting and exciting activities for tulpa and their creators alike - it is quite literally letting your mind wander.
— What does it mean to ‘explore’ a wonderland, Tulpa Subreddit FAQ

You are awareness, and you have passively created a wonderland and a tulpa with which to explore it. The person you think you are is just your first tulpa. With this knowledge, you might choose to create others, to delete your first tulpa and take your stand as the creator, and you might even consider amending your wonderland to a more pleasing layout, for a more flexible existence... [2]

[1] In fact, it could be said to be our-self, it's just not what we are; it's something we have.

[2] Check out the Tulpa Guides [<https://www.reddit.com/r/Tulpas/wiki/guides/>]. I think many of the techniques referred to there could be adapted for oneirosophic endeavours.

...

If I am just awareness, why is it that i have a preference for certain types of tulpas, or is that the original tulpa creating tulpas of its own?

Thinking it's not awareness that has the preference. Other tulpas: I'm thinking it happens just by implication. The first tulpa implies further tulpas by expectation and implication, in the same way it was created. I don't see "ego" as central overall, in the larger picture. The ego is an idea that you have, and because you identify with it you end up with thoughts and actions that arise consistently with it, out of expectation. Other regions of awareness end up with the same thing: behaviour via expectation,

clustered around an idea, from deliberate or accidental forcing. So it depends on where you "stand". If you are standing as /u/cosmicprankster420 then you experience a world that is implied by that tulpa, and that includes other tulpas. If you stand as awareness itself, then you no longer take the perspective of the first tulpa, and this no longer applies. But I'm not sure I've understood your idea of a "middle self" properly!

EDIT: Synchronicity alert: As I was typing that, the YouTube series WTF Moments from [MoveClips.com](#) I had in the background played the "there is no spoon" clip from The Matrix. Although this was immediately followed by a clip from Mr Bean. Make of that what you will.

Q: His middle self idea carries two constituent parts. First is like a Platonic Form. Using his example, his middle self carries a certain attribute that is transmitted to tulpa-selves, in this case Green. Second, it's almost like the HGA concept. A higher self that stands as an intermediary between the Ego and the All. Edit: I encourage any of my psychonautic friends to eat their preferred mushroom and read my post. I'm freaking myself out at this point.

Ah, I see it. Well, there can be endless subtleties of patterns within the awareness that we are; a pattern of predominant "green-ness" could indeed precede/seed subsequent manifestations. It wouldn't need to be a "conscious choice" as such, simply a bias in the pattern. (i.e. None of them are really "doing" anything.)

...I like the interpretation, although the tulpa is not meant to share the same form as the host. However, with the First Tulpa, who's to say a Second Tulpa can't have equal bidding, and perhaps take over? Maybe it's more like the recent BBC America TV Series, The Intruders.

Q: Alan Moore describes an interesting experience he had with someone else's tulpa that he was able to interact with here. Start at 1:03:15 and go until 1:13:00ish in order to get some context and then the experience.

Very interesting, thanks. It bridges the boundary between tulpas as practiced on that sub (create a sentient consciousness, spend time in a wonderland) and the Tibetan twist (actual materialisation, in this wonderland). The difference may of course just be one of limited beliefs, and hence constrained experience, today. In other words, the level of "solidity" required for most people to perceive a form may be much higher than it was previously.

Still, interesting they experienced her differently visually. Does "everyone" experience us the same, I wonder?

Q: Another thing I was thinking about as I've been mulling over your post is that other people are all indistinguishable from well-developed tulpas that are occupying a well-developed mindscape. Earth is just another mindscape in our imagination.

Yes, exactly!

This is what I'm saying with the final paragraph: You are the First Tulpa in your awareness, and all around you are the other tulpas you have created - some by request, some by implication, all unwittingly - to explore your mind together as this unfolding wonderland...

Q: Believers in tulpae are like dogs mistaking their own reflections as others. Only in this case it's a mental reflection. If you think that deluding yourself into thinking like a stupid dog is an accomplishment, you have my greatest sympathy.

The point is that people are already deluded, before they get involved in deliberate tulpa creation.

Q: Yes, one of the big things is that people will make a "tulpa" of other people, projecting their own thoughts etc into others when it's completely unwarranted (I was guilty of this in the past with extreme social anxiety, thankfully I was able to completely cure it.) Gods themselves are just "tulpae." And of course method acting is just sort of like being your own tulpa.

"Stimulant" is a related concept = Your internal representation or simulation of other people that you use to understand the meaning of their actions, anticipate their responses to yours. Difference is the underlying assumptions about experience: One is your model vs an external world and person, the other is seeing people as an actual part of [the larger] you. Separating the two experiential would be challenging, since from your localised perspective the evidence is identical.

The Circular Ruins

The purpose which guided him was not impossible, though supernatural. He wanted to dream a man; he wanted to dream him in minute entirety and impose him on reality. This magic project had exhausted the entire expanse of his mind; if someone had asked him his name or to relate some event of his former life, he would not have been able to give an answer. This uninhabited, ruined temple suited him, for it is contained a minimum of visible world; the proximity of the workmen also suited him, for they took it upon themselves to provide for his frugal needs. The rice and fruit they brought him were nourishment enough for his body, which was consecrated to the sole task of sleeping and dreaming.

-- The Circular Ruins, Jorge Luís Borges

To know you are not a person, this can be done. Releasing your hold upon content and therefore attention, your focus loosens and expands, deepens: you re-identify as the world. To discover that you and all experiences are made of consciousness, the non-material material whose only property is awareness, that is easy. However, it is the patterns within this consciousness that constrain your perspective, not the nature of it.

What are you beyond the world? What is its context? How can you perceive outwith a container that has no boundary, escape from a room without walls?

A "first person" account of not-existing?

...

Obviously, "first person" is in quotes as a way to indicate that the idea of there being a perspective (1st or 3rd) or a person (localised view) are meaningless during those experiences. Reading the account, you can see how language just doesn't capture these experiences without being misleading.

On existence: Well, that's a blurry concept. Everything could be said to "exist" as potential [experiences], although most people think of "exist" as being actually sensorily perceived, but by that definition when we stop looking at something and things fade into the background, they are not "existing" anymore. The whole concept is a poor one. Better to talk about relative intensities in experience or something.

Everything is perspectival.

Perspective implies a here and a there. When all distinctions fall away, what is there to have a perspective on?

Perspective implies that there are alternative ways of experiencing to what's happening now.

In this context (which is about 1st-person, 3rd person, and so on), "perspective" exactly does mean location and distinction.

When all distinctions fall away, how do you distinguish lack of distinctions from their presence?

What would you need to do any distinguishing? The experience itself just "is". That's a problem, an artefact of language, of the subsequent description, not of experience. I don't think you actually read the account, or you wouldn't be saying these... ill-informed things. You are trapped by your own words, Nefandi, forever distinguished from the truth.

You're confused. Experience is language. Language is not something different from and alien to experience. All experiencing is symbolic. All experiencing exercises a mind's faculty of discernment in one or another way. All experiencing is perspectival.

This is not really true. Language is an experience and symbols are an experience. But experience is not language. (That would limit us to division.)

Anyway - the point is that language cannot describe the linked experience, because it is before division and relation. To think about something, to talk of it with language, it must be cut up into parts, and those parts related to one another (in mental space, so to speak). All of which occurs, within consciousness. When all of that fades away, those distinctions vanish. Until you try to think about it of course, in which case you immediately introduce a split. This is one of the points made in the account. You can't really describe an experience, you can only set up a parallel experience at the same level, and declare one equivalent to another.

That's because language cannot describe anything. Words cannot even describe other words. If you read thesaurus definitions, they don't actually describe anything. All definitions are circular and they all assume you already sort-of know what's going on. If you don't know what's going on, a thesaurus can't help you at all. The role of language is not to describe, but to structure. Does experience have structure? Of course. Is mystical the same as mundane? No, it isn't. Is language the same as non-language? No, it isn't. That's structure. That's the discriminating faculty at work. That's language.

Then you don't mean language, you simply mean distinction and reference. Saying everything is language is like saying everything is meaning - it's just abstracting away until there's nothing being said. You don't escape from discrimination by analysing it; you simply cease to attend to it. Otherwise (as you indicate) you keep getting apparent further divisions - albeit in thought.

Let's get back to it: if all content faded out now, would you still be a perspective?

Characters are symbolic, but what about space around, inside, and between characters? If you don't think space is symbolic, then mentally remove the space around and inside the characters, and what happens? Do you still have recognizable characters? Is letter "a" still the same letter if it has no outline that separates the inked part of the letter from the background canvas? If words are symbolic, everything is.

Oh really. What is space a symbol of?

Let's get back to it: if all content faded out now, would you still be a perspective? Of course I would be. I'd recognize there is no content because I know what content looks like and this isn't it. This would be a perspective.

I don't underestimate you, but I do think you mix up your uses. You are using "symbol" incorrectly here. The space inside your body is not a symbol for conventional identity and privacy, it may be associated with those concepts, and an illustration depicting a body-space may be used to represent those concepts in certain contexts. I think there is a better way to say what you are trying to convey.

"Let's get back to it: if all content faded out now, would you still be a perspective?"; Of course I would be. I'd recognize there is no content because I know what content looks like and this isn't it. This would be a perspective.

As soon as you did that, as soon as the recognition (the thought of your experience) appeared, you would indeed become a perspective again. As soon as you think about it or try to describe it or reflect upon it in any way, you stop being it. I maintain that if content faded you are not a perspective, or indeed anything. You have ceased to "take on the shape of" an experience, and simply "are".

You think symbols have own-meaning apart from space.

No. You are confusing two things: that space defines non-space (fine) and vice versa - and the meaning of the letter, it's association, it's mental pattern-triggering.

But how would you know it appeared? You'd have to recognize the old state as though it were distinct from the new.

No, there's no recognition, there is simply being. Recognition would break this, introduce relation. It's not even a "state" because it is before states, although the limitations of language mean we must label it like this or similarly. It actually cannot be talked about. If you really don't understand this, then you don't understand the basis of oneirosophy.

Symbolic means representation, one thing points to another. You mean something more like "implies" or "is of a piece with". I also think you are mangling the use of the word "meaning". Are you mixing one type of experience with another, perhaps?

...Right, I'm back, and I've had a coffee and a croissant, so I'm less antagonistic. Let's start, if way may, with a metaphor and then build to symbols and polarity and so on.

Desk, Paper, Origami, Fun

There's a piece of paper on my desk. I take my pen and try to draw a representation of the piece of paper, on the paper.

- What shape can I draw which will accurately do this?

Now the piece of paper itself has awareness. It tries to form a representation of itself in an attempt to experience itself. It tries to do this by folding itself, origami-style.

- What shape can it adopt that will actually do this?

Now, the piece of paper arbitrarily designates its left half as "internal" and its right half as "external". The right hand side had formed into a bump:

- Is that right-hand bump a symbol?
- Does it have inherent meaning?
- Is it symbolic of anything?

If the paper forms its left half into a bump and declares it to be representative of the right-hand bump:

- Is the left-hand bump symbolic of the right-hand bump?
- Does the meaning of the right-hand bump change?
- Does the left-hand bump have an inherent meaning?

Yup, but remember metaphors have limitations.

Well, quite. That was the point. That's where the metaphor becomes quite "meta" because it itself illustrates the problem with metaphors because that's what it is "about".

So the best way to represent itself is not to fold, but to remain flat.

Exactly. Or to be clearer: the paper finds that it cannot represent itself and to accurately capture itself it can only relax and be itself. That is the situation we find ourselves in when we try to talk about this non-experience experience (or whatever we want to call it).

We are not like the paper.

We are not "like" anything. Of course, the metaphor isn't intended to capture what we "are" (for this cannot be done) but to illustrate the futility of something trying to describe itself by using itself, or even describing part of itself using another part of itself.

If you relax you won't find yourself nor will you be most like yourself.

Well, there's nothing to find. If you were to completely relax then even the "presence" thing would be gone (whatever we want to call it). If all activation went completely...

There kind of is something to find. A

"Nothing" in the sense that you tend to find what you are not, if that makes sense. As you explore, you associatively discover more and more things that you "become". You find more experiences by looking; you find more shapes but you don't find the "paper" as it were.

Ordinary relaxation simply reinforces pre-existing habits.

Well, relaxation means ceasing triggering but that doesn't undo what has been done; detachment allows the current thread to fade out completely, potentially, but if you don't assert anything different then you just re-trigger the same patterns into experience again. Of course, you could always just start a fresh thread from a new "seed" thought and let it become 3D-immersive. I'd say that relaxation (ceasing to trigger) lets things settle to their current stable state and can offer some clarity depending on what sort of patterns you've been engaging thus far. Some people are lucky and they get an experience which reveals to them that, wait a minute, I'm not a body in a world, etc. Others, it's too noisy and the feeling of boundary as become too established. In any case, at some point faith is required. If you want to adopt a new state, you have to become it, you have to "take on the shape of" that new state. This is the active-assertive approach rather than the passive or investigative approach. You stop waiting or tinkering with what seems to be there, and just go for it. Since anything that changes, you cannot truly be fundamentally, then that is a good way to see, the nature of thee.

We agree overall, but:

It's not mechanical in the way you describe.

I think it is mechanical though - in the sense of being "stupid and basic", happening independent of context. In the sense that to change the balance on your sound system, you don't need to worry about which band is playing which song. The world has no depth and consists of inter-triggering patterns. It is has no intelligence apart from its creators. You don't necessarily need to solve Columbo's case before you can switch channel to watch Mr Robot.

So it's always the best strategy to assume the best and instantly go for the target state. You'll either succeed instantly or you'll learn what blocks the path by bumping up against the blockage.

A great point. It can be tempting to try to work out the state and solve it advance but - as our little metaphor form earlier shows - that "working out" is a parallel pattern and resolving it does not necessarily translate to resolving your state. Instead, it's best to simply assert the final state as your immersive experience, and immediately you'll get a response. Now, you don't necessarily need to deal with that response as such, but you need to accept it and incorporate it rather than avoid it or try to circumvent it.

[On "stupid and basic"] Relaxation is contextualized by your dominant narrative, habits, hopes and fears, etc.

I wasn't being specific to relaxation there, actually. This was about not having to deal with the details of something before asserting something else. Your narrative, habits, hopes and fears don't matter at all, unless you decide to wrestle with them. Let them go; there's nothing behind them. Assert, and your apparent world will blindly shift to the target state. (I'm not guaranteeing this will be a pleasant experience, however.)

Oh, no. You still need to work out your target state. You need to be able to envision your goal. If you don't know what the goal looks like, feels like, and intellects like.

That's not "working out". If you don't know what your goal looks-feels-intellects like, then you don't actually have a goal at all. To some extent this is what I mean about the "basic" nature of things. If you know what you want? Draw it in detail in the space of "your" consciousness. A result is guaranteed. However, any details you don't supply will be filled in by implication, so it pays to fully render the state.

So if you know you don't want the present state, but you can't envision a better state, you have to do what?

Then you'll roll along on your present logical trajectory. Fortunately, you can always conceive of a better state, and explore it fully. It does not need to be connected to the present one; in fact one should not seek the connection.

People are often so inured in convention they can't imagine something radically different as an immediate and readily available option.

We skip all that, surely? If you can imagine a moment you'd like to experience, that's all you need. You can explore the detail of that, great. It's hardly a challenge. Naturally, one must be aware of these ideas to bother doing so. But that's true of anything, so surely we aren't talking about the random citizen who does not yet understand that there is no depth, and he has power over his situation? You don't even need to imagine it as an immediate and readily available option. It's a dumb, automatic mechanism. In fact, working it out gets in the way - that's why faith pays. Do the thing and you'll get the thing.

No, it's got nothing to do with "fake". I use the word "parallel" to indicate they are of equal standing, it's simply that one is not the other and that needs to be borne in mind. There is no equivalence. Fake and parallel have quite different meaning, especially in this context, and especially when I was referring to a metaphor which explicitly supplies a context for what parallel patterns would be. It's you who have suggested that some patterns are "fake". So I should ask: fake in what sense?

What's the problem with a parallel conception in your view? Why did you bring it up as something that's problematic?

Obviously the worst problem is confusing a conception as "what you are". However, the daily issue is that you end up operating on the parallel rather than asserting directly. For instance, we might work out a theory about our bodies and how to cure certain problems thinking that this will resolve our difficulties. However, what's happening is that we are exploring a story about our problems which is independent of our actual symptoms - unless we are fortunate enough to have declared explicit equivalence (which is pretty rare; basically magickal assertion). The other more pertinent issue is something we see all around us today: people working through fictional descriptions of mind, brain and consciousness trying to solve things and derive insights from patterns which do not exist other than abstractions. In general the issue is: People are dealing with patterns parallel to the world-pattern, and are not affecting or interacting with that.

Anything that is not a direct experience is a story about experience (itself an experience). The trick is to know whether you are interacting with the world or a story about the world. It's the difference between actual change and fantasy about change. Obviously any discussion about these things is a story, a narrative. That's language for ya. But so long as the participants understand what is being pointed at, all is well. (The problem is the confusion or assumed equivalence, not the presence of parallel patterning in and of itself.)

All experience is a direct experience of what it is. The error is to mistake one thought-stream for another. The "world thought" just is. The parallel thought just is too - except if it becomes a thought about the world and take it as equivalent, and then you've got a story.

If you understand what is happening, that's fine. Then you won't mistake operating on one stream with operating on another. The story of our times is the reification of abstraction, the confusion between streams - e.g. taking scientific concepts as "factual" in the same way as world-experiences are inherently factual. Confusing "aboutness" with immediacy.

Whether any two phenomena are the same or different is ambiguous and is a matter of perspective/emphasis.

Two phenomena are always different. That is clear.

Hint: it's to do with the use of the word "two"...

...

Well, that was quite fun. I'm a big fan of "geometry going astray" to help illustrate stuff. Unfortunately my mind is now full of infinity - again. Waves in the blue ocean are located relative to one another, but where is "blue"?

Right next to red on the color wheel.

It that the one on top of the turtles? Perhaps I'll take it for a spin...

...

"I am unknown by death. Nor known by life." -Nefandi

MANAS & The Subjective Reader

I've been finding a few inspiring gems in the old MANAS journal editions, available free online. Some of them are about subjectivity and reality, others are more about society - e.g. issues of conformity and freedom. Lots to wade through, but people might find things that interest them re: the larger picture of world-creation.

MANAS is a journal of independent inquiry, concerned with the study of the principles which move world society on its present course, and with searching for contrasting principles- that may be capable of supporting intelligent idealism under the conditions of the twentieth century. MANAS is concerned, therefore, with philosophy and with practical psychology, in as direct and simple a manner as the editors and contributors can write. The word "manas" comes from a common root suggesting "man" or "the thinker." Editorial articles are unsigned, since MANAS wishes to present ideas and viewpoints, not personalities.

-- [<http://www.manasjournal.org>]

Here's an example of an article that's interesting on Theodore Roszak and linking objective vs subjective science. Sample quote:

I would like to help you gain an appreciation that came to me only slowly, painfully, and with much difficulty: how our intellectual concepts and beliefs limit our ability to perceive what is really happening in the world. When the world "was" flat, the heavens "had" to move around the earth. We see the world through the blinders of our own beliefs. When the world's behavior resists our expectations, as now seems to be the case in many areas of policy analysis, we need to question whether some of our important beliefs are in accord with reality. Unfortunately, our most basic beliefs are seldom accessible to our conscious mind: they appear to us as simple, unquestionable observations about reality. . . .

To truly see that one of your own beliefs is just an assumption can be liberating. This experience, though, is not amenable to precise programming. You must stretch your mind, envelop your beliefs with contrary thinking, and allow your imagination to roam in forbidden territory without automatically rejecting its perceptions as "absurdities." . . . By holding fast to certain beliefs, you may be denying a part of yourself that would come to the surface if you were willing to accept a somewhat different set of values or beliefs. . . . What I am suggesting derives from a belief in the indivisible unity of life and, therefore, in the importance of making work an integral part of the whole. . . . To be able to integrate your life, however, you will first need to re-examine your unquestioning belief in the superiority of "objective" over "subjective" research, a belief apparent in your condemnation of what you consider subjectivity in my writing. Until you relinquish this belief, you will be afraid to approach work with feeling as well as intellect for fear of losing your much-valued objectivity. But, pure "objectivity" doesn't exist, since any observations, experiments, or analysis must always be done by a person, who inescapably must have values, emotions, and feelings that influence his or her work. . . .

You seem, however, to believe that because you desire to be objective you will be immune to those passions, prejudices, and dominating opinions which "are the abundant source of dangerous illusion." [Laplace.] What nonsense. I am sure that Laplace would agree with me that those most likely to be led into dangerous illusions by their emotions are those who would deny most vehemently that emotion played any role in shaping their opinions about "objective" truth. . . .

I have no desire to deny that my views of the world influence my work. You term this "subjectivity" and denounce it soundly. I term it "wisdom" and recommend it highly. By drawing on all of my perceptions of the world, I believe I obtain a more complete and coherent view of the world processes that are unfolding than would be possible if I limited myself to information that I process intellectually and analytically. In a sense, I work backwards from my overall view of the world to the specifics of a given problem, applying tests of logic and evidence to check the correctness of the perceptions derived initially as well as from thinking.

-- Vince Taylor quote, No Precise Programming, Manas Journal, Volume XXXII 1979

We Are But The Dream Puppets Of Picard

Now, this is more in the realms of /r/synchronicities but because it's part of a chain of events that relate to this sub, I'm going to post it.

In my downtime over the last month, I've finally been putting a bit of effort into philosophy stuff - reading things I've been meaning to catch up on, overdue film viewings and suchlike - all related to the nature of reality, thinking, perception, imagination, dreams, all that. In among the masses of comments recommending related film and TV to watch, someone recently mentioned an episode of Star Trek: The Next Generation that has parallels to one of my favourite stories on this sub. Forgot all about it; was never all that into Star Trek and haven't seen it in maybe 10 years. Browsing the web with cable TV on in the background yesterday (not usual, I always watch DVDs or downloads, not broadcast) getting bored of the sound of Ben Miller's voice in Death in Paradise, I flick the channel up - Friends - and again - Friends again - once more - it's Star Trek: TNG.

"Hey, I wonder if it's that one about Picard's dream? That would be amazing."

Channel starts, Picard's on the bridge and within a second gets knocked out by some mysterious energy ray. Wait for the end of the opening credits for the episode title. Sure enough, it's The Inner Light, the episode all about living a full parallel life in (effectively) a dream, packed with relevant messages. And an annoyingly persistent flute melody.

If this world suddenly evaporates later today, revealing all this to be part of a post-meal nap Patrick Stewart is having, I won't be all that surprised.

TL;DR: I watched TV yesterday. ;-)

...

Q1: Synchronicity is weird, and your case is even weirder, because the episode itself was of a glitchy nature!

I hope it won't look like I'm trying to one up you, but something very similar happened to me a few weeks ago and I don't feel like it's worth a separate post, so I'll use this opportunity to share my story: A few weeks ago I woke up with a song already stuck in my head (I suppose this happens to everyone sometimes), it was the so-called Suki-yaki song. While I was making breakfast with the song playing in my head I remembered reading that the singer, Kyuu Sakamoto, had died in a plane crash and there was huge controversy surrounding the accident, but I didn't know what it was about, I had been going to find some details about that, but I'd never gotten round to it (that was months before I woke up with that song in my head). So, as I was making breakfast, I made a mental note to check what this was about when I have a chance. Then I thought that I might as well watch some TV while I eat (not something I usually do). The first channel that wasn't playing commercials was one of these "air crash investigation" documentaries and I thought, just as you did, "It would be so weird if it was about that crash I was just thinking about!". And it turned out it was.

And in case someone was wondering what the controversy was, the US army stationing nearby was ready to start the rescue minutes after the impact, but the Japanese refused. A rescue team was then sent by land, spending the night in a neighbouring town because "eh, everyone is probably dead already". When they finally reached the crash site 14 hours later, most survivors have indeed already died of injuries and exposure.

Good story!

What I love about these experiences is, you can't really identify the start point. There's a complicated process of unlikeliness for everything to line up. One part can't really have "caused" the rest - it's like one complete pattern that must have come into being all at once; it's just that we experience it moment by moment.

Today's Random Theory
there's always one brewing, sorry

When we have a problem to solve, we usually think about the problem and its details, and generally try and "work it out" by effort. Sometimes we get to the answer by doing this, usually we have to stop and let it be. Quite often, the answer then just comes to us, pops into our heads, later. Curious!

There's a book called Autopilot by Andrew Smart which talks about how, when you stop consciously directing yourself, your brain is actually at its busiest. (fMRI research often ignores this "background" as distracting, but it's actually your default mode in life, or should be. You are right to be lazy.)

The best way to generate ideas and solutions, in other words, is to set up the problem and then leave it be: all your resources will work on it holistically, and you'll be alerted when this is done. Trying to solve it actually interferes with this process: you keep resetting the problem back to its starting point!

I think of this as: A problem isn't solved really, not by action - a problem is actually a thought which gradually and naturally unfolds and changes into its own solution. The solution is implied in the problem, or: the only difference between a problem and a solution is time. So, what if the whole world works like this? When you have a 'problem' or a 'question', it's not just your brain that is constantly busy moving from the 'question' to the 'answer' - it's the whole universe. Sometimes the answer will come as a thought in your head; sometimes as a television programme; sometimes as an overheard conversation on the street; sometimes as a spontaneous action you end up doing for no reason...

TL;DR: Left alone, the universe naturally moves from the problem to the solution, from the question to the answer. Does your life in fact constantly seek to solve itself, if you let it, by whatever route is available?

Q1: This autopilot thing seems to make a lot of sense, when I couldn't remember some word on an English vocabulary test I would move on to other questions and the word I was looking for would always "pop" into my head later. As for the universe theory, I know you didn't mean it in a religious way, but it's very similar to what a nun once told me, that when you have a problem and there's nothing you can do, just stop thinking and let God do his thing and a solution will appear. I've followed this advice for years and haven't been disappointed once :)

Good observation!

It's not really a religious thing, it's more a how-the-world-seems-to-work thing. Those prophet types just got their version in first!

Maybe all religions are based on fundamentally sound ideas about the world (or rather the mind) probably, trying to convey essential truths as seen at the time. The teachings just become corrupted in the service of the "business and power" aspect of mature religious organisations. Even the whole notion of "God" gets mutilated into a vengeful entity, rather than the "nature and inherent intelligence of existence" (your mind as it works if left alone) as originally intended.

The essence:

-- "Ask and it shall be given to you; seek and you shall find"

Actually, the alternative translations say it even more clearly [<https://biblehub.com/matthew/21-22.htm>]. Neville Goddard, a New Thought thinker last century, built a whole approach to life based on interpreting the Bible as a "manual for the nature of reality, the mind, and living". Fascinating stuff.

Set up the pattern or define a problem, let the "universe" unfold and solve it! If that isn't an example of "faith", what is? (I'm not religious at all, I just find these connections interesting.)

...

Q2: I watched TV once... never again.

Well, I've definitely learned my lesson, that's for sure. I'm sticking to my etch-a-sketch from now on [<https://entertainment.howstuffworks.com/etch-a-sketch-pictures.htm>].

Q3: I am watching it now on Netflix. I have never watched before, any star trek TV show, and I am well into my thirties.

I am watching it now on Netflix.

Did you start watching before coming across this story, by searching or whatever?
Or did you look it up on Netflix after reading this?

Q3: Yes, after reading this. I myself, as crazy as it sounds, fully believe that I am not living in the same life I was ten years ago. It's not a fully formed idea, and it's entirely conjecture...but it's a feeling I can't shake.

It's possible that none of... this was as it now "was". How do we tell whether it is us, our minds, that change - in a moment of epiphany say -or the world? We have a feeling, a tugging, so we investigate further, and find we cannot separate the two.

Darkroom Vision & Chef Hats & Dreams

I was reading a blog post on how we represent the world to ourselves - a really great article, here at the Well of Galabes blog - and a couple of the comments underneath it seemed relevant to our Glitch explanation efforts so I've included them below. They emphasise how much our experience is at best 'inferred' and at worst 'created'. The comment on the narrative flexibility of dreams is interesting too. You can imagine both of these appearing in this subreddit in one form or another, as reports.

Darkroom Vision

"I realized I have a much more dramatic example of the pure subjectivity of perception in my personal experience. It's what I call my "darkroom vision." When I was in college and taking photography classes, we were provided with a large community darkroom. The safelights were always on in the darkroom, of course, as there were often several people working in it side by side. One day when I was working, the power went out and the safelights went off. A darkroom with no safelights is truly dark; even with full night vision adjustment human eyes will perceive no light. Those of us who were working in there fumbled our way out to wait for the power and lights to return. After a while it was apparent that power was not coming back anytime soon, and I had left some prints in the fixer bath. So I went back into the darkroom to retrieve those prints and move them to a water wash. When I got in the darkroom, I realized that I could very faintly see the big table in the middle of the room with all its individual tubs of developer, stop, and fixer. This disturbed me, since a darkroom is supposed to be absolutely dark. I reached for the corner of the table, and when my hand reached it, there was nothing there. The table immediately vanished from my sight. I fumbled around a bit, found the table by feel, and instantly it popped back into view in a new, and "correct" location. Though this image was faint, it was definitely a visual image, indistinguishable from what I would have seen had there been a very dim light in the room that was just barely above the threshold of perception. But, given the disappearing and reappearing act the table put on, it was also clearly coming from inside my mind, not from any "objective physical reality." After this experience, I discovered that I can always see by this "darkroom vision" when I am in familiar places in total darkness, but (here is the key) ONLY if it is a place I know well in the light. It is very useful. The image includes things that I do not have a direct conscious memory of. If I have misplaced something, I can look around for it, and when I see it and reach for it, it usually is there. It's funny, when it is not there, to see it vanish. But it is usually not far from where I saw it, and it will pop back in to view when I do get my hand on it. In one darkroom I was even able to read the hands on a large timer clock, getting some idea of how much time was left before it would chime. The reading I saw on the clock was often not exact, but it was fairly close. And of course the evolutionary biologist in me appreciates what a wonderfully clever adaptation this is, to present all this subconsciously stored information in a handy visual image, showing me all of my mind's best estimates of the position of everything in the room relative to where it judges me to be. I don't have to think about it at all, it is effortless on my part. I just look around. And it updates instantaneously in real-time based on new data."

-- Bill Pullium, comment [<http://galabes.blogspot.com/2014/06/explaining-world.html>]

Objects Revise Themselves

"I remember working in a kitchen, when a few of the cooks began to wear tall white paper hats like the chef had always worn. One of these cook's had a similar body-type as the chef, and sometimes when he'd enter the kitchen, from a distance and out the side of eye, in peripheral vision, I would actually "see" the chef enter the room, until he got closer and the image would shift back to the cook in question. This happened after I had started meditating and noticing the activity of my mind more. I was surprised, because it wasn't just that I was unsure of who this person and thought, "That might be the chef", it was the for a really brief moment, I actually had an image in mind of the chef entering the room, which was quickly altered as the cook came into better focus. Interesting also in that, from a social primate point-of-view, my mind was always scanning for the chef's presence, and how he might view my work.

I notice that phenomenon in the evening light as well, when I encounter an object that I can't quite make out what it is, but looks to be the size of an animal - it is very quick, but I can see my mind trying on various perceptions to the hazy figure: "Is it an animal? Is it a raccoon, or a dog?" until I can get a better view of the object, and the perception settles down to something more stable. I imagine these moments of perceptual uncertainty make conscious a process that is normally hidden from me, of how the mind decides what something "is", like a table, or chair, or person, etc., and then supplies an appropriate image, though it seems to me like I am simply "seeing" something that is "there".

Something else - in becoming aware of my dreams, I noticed that my mind has these moments of indecision, then decides on a narrative framework for things, then will alter past happenings to fit that framework. I'd always thought dreams were like movies playing from beginning to end in order, but on closer inspection, it seems more like streams of thinking, in which the mind will decide on a story, then go back and change what happened before to make that story coherent!"

-- Daniel Cowan, comment

EDIT: I also meant to include this link in there: we don't just see with our eyes [<http://www.healthaim.com/brain-able-to-see-in-pitch-black>], we see with our whole bodies. Absolutely all input acts as a source for our perceptions. Other interesting reading here.

EDIT2: Also this page on seeing through eyelids [<http://schwitzsplinters.blogspot.co.uk/2007/07/seeing-through-your-eyelids-spreading.html>].

EDIT3: And this article on "visual loops" vs inputs [<https://dondeg.wordpress.com/2014/10/31/the-beginning-and-the-end-of-consciousness-in-the-brain/>], which would fit in with the idea of an ongoing, persistent 'dream environment' which is updated as new information becomes available from the senses.

EDIT4: The stranger in the mirror illusion [<https://mindhacks.com/2010/09/18/the-strange-face-in-the-mirror-illusion/>]. And this completes my collection of "subjective is not, or is what you think it is" round of links.

...

I'll add another experience which is more accessible, that we've probably all had but perhaps not paid much attention to: When I misread a word, I actually do experience the wrong word - I literally see that incorrect word in front of me - and then it 'snaps' to the right word when I go back to check. This highlights how our experienced world is basically an inferred dream-space where the objects are a best guess, 'inspired' by sensory(?) input and historical context, and is continually updated as new information is received. This brings to mind Donald Hoffman's ideas on our experience being like a 'user interface' to help with our aims in the most efficient way, rather than an accurate representation. Anything could be going on behind the scenes. What we perceive may be directly related to our aims and goals, as things are filtered accordingly.

The dream thing really trips me the hell out.

Yep. Basically, each moment strives for 'coherence of narrative'. You're doing it right now. Actually, the process described of "trying on different interpretations" is an example of this. Normally we don't remember this; once the perception has settled, it was "always that way" for most of us. We delete any inconvenient histories as we go, once we've reached a decision.

I've heard about the night vision thing before. A lot of people say that when that happens you're looking through your pineal gland, your third eye. Interestingly the pineal gland actually contains rods and cones like your eyes do.

Yes, I've had the experience of 'seeing through eyelids' and the accompanying feeling is that I'm centred and 'looking out from' somewhere near my prefrontal lobes. This is also a technique used by some vision improvement approaches, interestingly - to "find your centre for seeing".

...

Not been there. I only heard about "gaslighting" recently on another thread (thought it was something to do with being Hitchcock-film-like, which it sort of is I suppose).

their pretend histories are totally real to them.

Probably don't even know they're pretending. I mean, it just is real and that's that, it seems. A universal tendency gone wrong? Will check it out.

...

Q: Just discovered this today.
EDIT2: Also this page on seeing through eyelids.

That's easy. The eyelids don't block 100% of all light, just most of it. Even fingers don't block all light. Having a hand waved (even not your own) between your tightly closed eyes and a light, you should easily be able to tell whether the object is between your eyes and the light, or not. Alas, nothing about the objects form and/or color.
Edit: And telling the direction of movement of the object is not difficult, too, because it's not really the eye that "sees", it's the brain that interprets the optical signals, not in terms of something like pixels but in terms of characteristics: A finger can have the same characteristic "moving from left to right" as a ball and as a stick and as a car. So with closed eyes you can't tell much about an object but the characteristic "moving from left to right" can be deduced from the brighter light / lower light order anyway.

A good attempt, but you've already come up with the seed of a better answer:

it's not really the eye that "sees", it's the brain that interprets the optical signals

You can take it a step further. Your brain doesn't interpret optical signals and turn them into images directly. The signals from your eyes and other organs all just contribute information, to the extent they are available and 'online'. What we actually do is essentially imagine our surroundings, based on inputs from the senses and from memories. Not in a "processing way" and not through conscious effort; this is the passive activation of previous patterns.

Certainly, if there are little bits of movement detectable those will contribute - but even in complete darkness you can still see the room around you when relaxed (and if you allow it to happen), although often it'll be a little bit wrong. (This skill is very handy, because when you look at how eyes work, they are rubbish at seeing - you are mostly blind anyway.)

In fact, people who go blind later in life sometimes find that after a while they can "visually perceive" objects around them again, as other senses provide clues from which the presence of those objects can be inferred. In other words, what you apparently see around you right now is a hallucination "inspired by" whatever information is available. Which is why you can still see in dreams, even though you don't have any eyes!

The problem here is with the word "seeing" because in common usage it implies "eyes" or that you are somehow perceiving a thing that is definitely there. Perhaps it's better to keep it to the essentials: "Seeing" is having the experience of seeing something, whether or not there is a something actually there, in the form of an image.

Also, I don't believe that one can still "see" in complete darkness

You can. You don't need any light at all to experience a complete room around you (as described in the post). When you try to act on the basis of that image, it will update according to the cues provided by touch though - in the same way everyday seeing is updated by the little snippets of optical information your eyes periodically provide. Or more accurately, the content of attention as it scans. It is a relatively rare experience though, but if you relax enough you can have it. In fact, it might be the natural state of vision if we aren't interfering through effort.

But this works only once you know an object and/or have seen it before.

You can only see things you've seen before (when you see a new object, it is made up of raw shapes and colours, or other familiar elements in an arrangement; it takes a while for it to become its own complete pattern). If you have a misunderstanding of an object, you will "see" that misunderstanding, until a closer look reveals the contrary detail. It's a fun thing to experiment with.

Huh? Seeing without having eyes, in a dream? That never happened to me.

Of course you have. I mean, do you think that "dream eyes" take in "dream light" which is then processed in a "dream brain" so you can have some "dream seeing"?

Although your dreams do sound as though they could do with a bit of perking up! ;-)

An interesting observation though: Sometimes we have "knowing" dreams where we aren't actually experiencing. Almost like we're just getting narrated the content. And you are usefully highlighting that we don't all have the same experience!

(If you've ever had a lucid dream though, you'll realise that a dream environment can be more vivid than everyday life.)

Right. We can get right to it: How can you tell the difference between "full imagination" and not "full imagination"? After all, we only know we are "deceived" when our experience shifts in a "correction". I mean, have you really examined every part of the room you are in? And yet, you don't feel as though there are "gaps" in your visual experience of it. There are most likely vast parts of your daily experience which you have never examined properly - and you are therefore just completely hallucinating, without knowing it. I think of it as "dreaming, inspired by the senses". Of course, I have no access to the information provided by the senses at all - only the final conclusions - but we tend to assume that what we are experiencing is in some way contributed to by such things.

If that would be the natural state of vision, it would be better to have no eyes - I just don't believe that.

No, that's not what I mean. I mean that, in a relaxed and open state, it is possible to have a visual experience of your surroundings even with eyes closed. When you go up and down stairs and use your keys with eyes closed, if you pay attention you'll find that you do it via a sort of "three-dimensional feeling-out". There's not much difference between this and a "three-dimensional visioning-out".

What about babies? Everything is new to them, they don't have names for anything, how could they learn to see?

Why do you think having names for things matters? (It's an interesting assumption!)

Babies learn to see slowly, and it happens passively. There are probably raw "archetypical" or building-block shapes which can be perceived immediately (it is thought). Exposure gradually clumps these together into trace patterns. Lines and circles become associated in certain configurations into whole patterns of increasing complexity, into what we term "objects". Simple exposure over time will result in this pattern formation.

What I see with dream-eyes is full imagination.

Right, you don't have functional dream eyes, do you? You just have the imagination. The dream eyes are inside the imagination. Your dream experience isn't "inspired by" the input of dream sensory organs.

Close your eyes and take it away: With eyes closed you can either image it still being there, or taken away.

A couple of questions to ponder:

- Why don't you go blind (or blurry) every time your eyes move?
- Isn't blinking and eye-shifting essentially closing your eyes?
- How can you tell the difference between a dream experience and a waking experience, apart from by memory and expectation of what is "usual". In other words, what about the direct perception of the moment is different?

I had some dreams where I could take control over what I did

Yep, if you knew you were dreaming while in the dream, that's lucid dreaming. Interesting that you don't have colours! Next time you have such a dream, just "ask" for it to be super-vibrant and in colours. And don't take "no" for an answer! :-)

Interestingly, in the 1950s/60s it was thought that dreams were black and white, and people nicely played along by having black and white dreams, and those people didn't believe it was possible to dream in colour because they'd never experienced it. But it was. The same thing happened with lucid dreams.

Repost: A Parallel Life / Awoken By A Lamp

One of my favourite glitches is this one posted by /u/temptotasssoon, who apparently lives an entire life in the moments after a head injury. He eventually awakes from this dream when he notices that something is strange about a lamp.

People are always asking for it, but because it's in a comment rather than a proper post, it's hard to search for. So, I'm reposting it here to give the story its proper place in glitch history...

NOTE - I am not OP. OP's account was a throwaway and the original comment is three years old. So don't expect any question-answering from he or me.

A Parallel Life / Awoken By A Lamp

throw away account cause this is really personal.

My last semester at a certain college I was assaulted by a football player for walking where he was trying to drive (note he was 325lbs I was 120lbs), while unconscious on the ground I lived a different life. I met a wonderful young lady, she made my heart skip and my face red, I pursued her for months and dispatched a few jerk boyfriends before I finally won her over, after two years we got married and almost immediately she bore me a daughter.

I had a great job and my wife didn't have to work outside of the house, when my daughter was two she [my wife] bore me a son. My son was the joy of my life, I would walk into his room every morning before I left for work and doted on him and my daughter. One day while sitting on the couch I noticed that the perspective of the lamp was odd, like inverted. It was still in 3D but... just.. wrong. (It was a square lamp base, red with gold trim on 4 legs and a white square shade). I was transfixed, I couldn't look away from it. I stayed up all night staring at it, the next morning I didn't go to work, something was just not right about that lamp. I stopped eating, I left the couch only to use the bathroom at first, soon I stopped that too as I wasn't eating or drinking. I stared at the fucking lamp for 3 days before my wife got really worried, she had someone come and try to talk to me, by this time my cognizance was breaking up and my wife was freaking out. She took the kids to her mother's house just before I had my epiphany.... the lamp is not real.... the house is not real, my wife, my kids... none of that is real... the last 10 years of my life are not fucking real!

The lamp started to grow wider and deeper, it was still inverted dimensions, it took up my entire perspective and all I could see was red, I heard voices, screams, all kinds of weird noises and I became aware of pain.... a fucking shit ton of pain... the first words I said were "I'm missing teeth" and opened my eyes. I was laying on my back on the sidewalk surrounded by people that I didn't know, lots were freaking out, I was completely confused.

At some point a cop scooped me up, dragged/walked me across the sidewalk and grass and threw me face down in the back of a cop car, I was still confused.

I was taken to the hospital by the cop (seems he didn't want to wait for the ambulance to arrive) and give CT scans and shit..

I went through about 3 years of horrid depression, I was grieving the loss of my wife and children and dealing with the knowledge that they never existed, I was scared that I was going insane as I would cry myself to sleep hoping I would see her in my dreams. I never have, but sometimes I see my son, usually just a glimpse out of my peripheral vision, he is perpetually 5 years old and I can never hear what he says.

EDIT (24 hours after post): never though anyone would read this, I changed a line so that it no longer seems that my 2 year old daughter bore a child.

I have never seen Inception or the Star Trek episode so many have mentioned (but I will eventually)

I will not do an AMA

I've had many PM's describing similar experiences and 3 posters stating such experiences are impossible, I'd say more research needs to be done on brain functions. Pre-med students, don't assume you know everything.

A few have asked if they can write a book/screen play/stage play/rage comic etcetera, please consider this tale open source and have fun with it

The Girl Who Saw Through Illusions

A little story I liked:

The Girl Who Saw Through the Illusions By Leo Babauta

The girl was at work when one of her coworkers said something demeaning about her work, and she immediately got upset, felt defensive, and thought all day about how the coworker was wrong and how she could prove it to him. At home, her boyfriend left his dirty dishes in the sink and the trash was overflowing and she felt irritated by his lack of consideration. She thought about how wrong he was, and why couldn't he just do these little things to be more considerate?

As she was stewing in her anger over these two people who had wronged her ... she wondered what was going on. Why did she have to be so frustrated, angry, irritated, by these little comments and actions?

The next day, she went to work, and noticed other people also frustrated and stressed out and angry at different times in the day. She saw it in the faces of strangers on the street, then in the complaints of her friends when they went out for a bite to eat after work.

What was going on?

Then she began to see something strange.

What she saw was this: each person had a treasure they were protecting. A beautiful gem that no one else could see, but that they felt was really valuable and that needed guarding. An Inner Gem.

When one person would interact with the other, even if the actions or conversations had nothing to do with the Inner Gem ... each person would worry that the other was trying to attack their Inner Gem. Everything became about guarding the gem, protecting it from attack, making sure it was safe.

The girl realized that the gems didn't really exist. She realized that we just imagine them to be real, and don't realize we're doing it.

She realized that it's all an illusion.

And it's making us unhappy.

So that day, she stopped trying to protect an imaginary gem. She stopped trying to be right, to be seen as good and competent and smart and perfect, to see herself as a good person at all times. She stopped thinking that other people's words and actions had anything to do with what she imagined herself to be. She stopped trying to protect her position and self-image.

And, gently letting go of these illusions, she became happier. She would smile when someone else would start protecting their imaginary gem, and realize that their frustration or rudeness had nothing to do with her, but everything to do with the gem they were protecting. She would go about her day, enjoying herself, and trying to make the world a better place.

-- Blog entry from Leo Babauta's Zen Habits

...

That's the idea, although I'd broaden it to being any sense of localised identity, a space that you are defending against the larger environment.

Q1: I like this a lot.

Whenever I take a step back in my head and pay attention to how and why I'm reacting to things the way I am I usually feel a lot better.

However the ego always creeps back into play and when I realize I am getting unhappy again I have to make a mental note of it and work on once again detaching from the ego.

I hope to be able to detach for good one day!

A step back in your head - and this is kinda literally true isn't it? An easier and more persistent approach is (I find) so switch "context" to the background space that experience is arising in.

Of course, you then have to just let actions be spotaneous and not push or rush or interfere - as soon as you do, your attention narrows (because that's how direct action works: you don't do it, you squeeze your attention).

Great when you're in it though! :-)

Q2: Never take anything personally

Right - because there's no "person".

What matters? You decide.

Yes, quite so.

Q3: In my way of thinking, the gem is not ego or individuality, but rather free will. I think free will is an illusion - a bad one, which makes us think that people are "responsible" for their mistakes, that they "deserve" punishment, and so on... the false idea of free will is, I think, the root of all anthropogenic human suffering.

An interesting idea. I'm not entirely with it, maybe. I'd say that "free will" varies in terms of context - in terms of the "sphere of attention". Someone who is narrowed on the body or certain thoughts is limited. Meanwhile, someone whose attention has expanded to the "background awareness" has more flexibility, greater choice. After all, free will isn't about the ability to do just anything, surely - it's about being free to choose among the maximum number of possible options, to take the route most appropraite for you. However, this "maximum freedom" is in a sense spontaneous, potentially - the only choice you fully have is the ability to "say yes" to it, to cease resisting. And of course, to be able to switch to this larger context, you have to either have encountered the concept of it ("grace") or just randomly have it happen to you (also "grace").

Q3: I'm not against the idea of freedom, the capacity to act. My problem is with free will, the idea that there's some sort of magical essence which is making "choices" and is "responsible" for its actions. It is manifestly obvious that the mind is an emergent phenomenon resulting from the brain, thus all our choices are the result of the shape of our brain, which itself can be explained entirely in terms of genetics, past experience, present environment, and of course the ever present quantum randomness. How can you blame someone for doing something which was the inevitable result of things entirely out of their control, some deterministic (as with genetics), some chaotic (as with experience and environment) and some random? Nowhere in that mess of causes is there room for a magical "free will force". When you let go of that manifestly ignorant, superstitious idea and recognize that all events, including choices, are the inevitable result of the laws of physics, you become able to forgive, to have mercy, to love unconditionally, as you realize that the illusion of self control is just that - an illusion. You also can learn to forgive yourself. Your mistakes are not "your fault." They were inevitable imperfections in an imperfect world - but the self acceptance which results from this realization inevitably causes some of those imperfections to disappear, and through the butterfly effect, a great good is unleashed upon the world.

Okay, I'll probably disagree from the "obvious of emergence" part for consciousness, but we can certainly say that the content of consciousness has correlations with the brain. We do have free will in the sense of identifying with one part of experience vs the rest, and having the power to pause and select amongst options. We don't choose those options, and we don't choose what we want to choose, but within the parameters of the environment we can select and "disobey". So self control itself isn't an illusion, what is in debate is the basis of the control in terms of information. If we don't have free will in that sense, then we can't choose to let go, or to learn.

If anything is a "magical free will force" it is awareness itself, which then turns out to accept what arises - so the real deal is that to operate the best you could ever operate would be to let go and have your entire being contribute to your actions. Also, I think that we can pause and 'ask' for random creative inspiration, and then act on it or not. This makes us completely unpredictable. We can always ask for additional options, in effect.

JUST IN: It turns out that even worms have free will, apparently [<http://www.sciencedaily.com/releases/2015/03/150313110402.htm>].

I suggest you research chaos theory.

I know what you're getting at, but I would say that we can't extend chaos theory to brains quite yet.

Do you mean attention, which is a product of brain patterns and is thus chaotic?

Is it a product of brain patterns? Where is it?

Or do you mean consciousness, that which perceives, the inexpressible "essence" of mind which is aware of those brain patterns?

Consciousness. I use the term "awareness" because consciousness gets confused with conscious-of and self-consciousness. I'm not convinced that consciousness is "emergent" from the brain. I'm inclined to say that it is a fundamental property. But that's a separate discussion, and it does not necessarily matter for "free will".

Where in all this are you seeing a free will force?

I don't suggest there is a free will outside of experience, I suggest something more akin to (as another responder said) compatibilism: There is a part of us we identify with, and there are the options which appear. Furthermore, we can 'ask' for further options. We are "free" only to the extent we can choose amongst the options presented to us, using all the information at our disposal. In other words, we can make the best choice. That's "free enough".

Can I add, though, that brains are deterministic 'in principle' but really we are nowhere near understanding the brain, so I stay back from saying things "are" this or that. I try to stick to my own experience, as it arises subjectively, initially. The step between determinism and randomness may be something more structured, a probability pattern based on intention. There is also the issue of self-reinforcing "perceptual memory" which needs to be explored.

Maximum free will: To have all the information in the universe available to you, and to choose your actions based on this. Which would be deterministic of course; you would always choose the best option.

My problem is with the idea that there's this supernatural force beyond the brain capable of controlling it...

Well, brains are a problem because we really don't know anything about them and how they correspond to subjective experience (beyond certain content correlations, and even there much of it is the opposite of what is expected). So we put that aside. I say that "Free Will" is the ability to choose amongst options based on all the information available to you. That's all that is required and that definition will outlast any changing notions of what a "self" is and what consciousness is.

I do not understand what you mean by deterministic in principle.

We have to say "in principle" because we do not actually understand or have knowledge of the mechanisms in use, we are drawing conclusions from our concepts of determinism and randomness. For instance, in practice what we have called "randomness" might not be what it seems.

I don't know enough about neuroscience to give you details...

Right. Really, if you actually look into the neuroscience, although it is grand for helping patients who have suffered brain damage and so on, it is basically rubbish as regards investigating the properties of awareness and subjective experience. Because it is not intended to - it's not "science" in the same way as physics. Poorly designed fMRI-based experiments do not a good understanding make, alas. That's why I tend to put the brain aside, as it were. The theories change so frequently (e.g. for vision and perception, etc) as to be meaningless.

Yes, of course pure consciousness (that which perceives) is a self-existent, nonphysical phenomenon, however it is somehow interlinked to the brain...

There are correlations between experience and brain activity. Changes in the brain cause changes in the content of experience. This is different to consciousness. For clarity, it is good to separate out different types: there is the consciousness (which I call "awareness" or being-aware to keep it distinct), then conscious-of (the content) and self-consciousness (the identification with a certain subset of content). Here is a previous post which covers it [POST: Can we formulate panpsychism such that it doesn't sound completely ridiculous?].

There are all sorts of issues with correlation 'attention' and even 'memories' with direct brain regions, etc.

Anyway, I'm tempted along these lines:

- What you are, is "open unbounded awareness".
- Within this, experiences arise.
- From the outside (3rd person) the brain is seen as the "image" of this activity, in the world dream as it were.
- This means that brain imagery will show:
 - Some correspondence to the surrounding environment (if that is what is being experienced).
 - Some correspondence to the thinking going on (if that is what is being experienced)
 - And: triggering brain regions would be expected to result in experience in awareness, just as a passing train would.
- The brain is not causal; it's something you are aware of. It's like observing images in someone's eye, and noticing that if you poke the eye they report different experiences.

In other words, what's really happening is that there is correspondence between the unbroken continuum that is the world and one's subjective experiential content. There is much more that can be said about that (your awareness actually includes the whole extended world, it's just that the content is "brighter" in the brain area if you end up focussed there), but then we drift off-topic.

Returning to:

I say that "Free Will" is the ability to choose amongst options based on all the information available to you.

The key here is, what information is available to you? Is it just the information localised in the brain area?

And I daresay science knows a lot more about the brain than you seem to believe.

I keep a good eye on it. Brains and consciousness and metaphysics are main areas of interest for me. Neuroscience is as rigorous as physics as a discipline as far as it goes, however (and actually physics is inclined to this of late) it makes public promises it doesn't know it can keep. Consciousness is one of them.

(It reminds me of the early days of genetic research, where we were going to have a "gene for every characteristic" via its blueprint. Of course, the reality turned out to be something quite different.)

The fact that the theories change frequently is proof that progress is being made quickly, not that they're all meaningless.

Or it means that it's ungrounded and unfocussed, with a 'theory-of-the-week' approach, because it hasn't yet developed an overarching and coherent framework. Individual research results are interesting and thorough, the attempt to connect the parts, however, falters.

Your awareness does not extend throughout the world. That is a manifestly superstitious concept.

I think you are misinterpreting me. Briefly put: I suggest that consciousness is fundamental as a property, and this is how we can connect 3rd-person and 1st-person views. It is not "my" awareness that extends throughout the world in an external view, however everything that I experience of the world does arise in my awareness.

stick to pure materialism and rationalism

Sticking to pure materialism is a problem, because it doesn't work, unfortunately, for these areas. It's fine as an unexamined background idea for 'patterns and regularities' as observed in physics, but it's no use for consciousness, alas. This doesn't mean we go to "woo land", it simply means we incorporate consciousness as a property (a la neuroscientist Christoph Koch, perhaps). Note, this isn't self-consciousness! Rocks don't ponder their existence. However, sufficiently complex entities do have a "what it is like to be them". For humans, the brain is the image of that, but of course that reflects the complete nervous system, which in turn reflects the environment, so effectively the brain is an image of the world. That is what I mean by the world being unbroken in awareness. Where do you suggest consciousness "is" in the brain? And why does it have that location and not another? And what is the stage at which an area flips from being not-conscious to conscious?

Inserting consciousness at a fundamental level skips all of those problems. The entire brain becomes the experience that appears in and as consciousness. We keep all of our great neuroscience stuff (brain patterns == experiential content) but don't need to worry about 'how come it becomes aware of itself'.

Q3: I agree that it's fundamental. I've agreed with that all along. But it only exists in the presence of information processing. You know how supernovae generate neutrinos? Well, information processing produces consciousness. I see it as a kind of field, like an electric field, only generated by phenomena which process information, rather than by just any charged particle. It is a field in abstract space, rather than any concrete location. It's not "in" the brain, any more than an electric field is "in" an electron. It results from the brain, and exists in some dimension of reality which we cannot yet measure. Whenever anything - neuron, transistor, or otherwise - enacts an "if then" statement, compares a set of data to a threshold and outputs the result of that comparison, thought is happening, consciousness is happening. You know how mass bends spacetime? Information processing bends consciousness-space. No, better yet - information processing IS consciousness, the same way gravity IS the curvature of spacetime. And how do you know the amount of consciousness? It is proportional to the level of processing, the level of pattern recognition. Anything that discerns patterns is conscious. The more complex the discernable patterns, the higher the level of consciousness. The more connections among processing units, the more consciousness. But NONE of this leads to free will.

We're not so far apart - for instance, I agree there is something that could be called a 'fundamental field', only it has no spatial or temporal properties. It's only property is being-aware and it comes before neutrinos and the like. And before information. Because it comes before patterns - patterns are formed within and of it. And that is what "consciousness" is.

Note, that being aware of things and being self conscious is a different level, and it misnamed because, indeed, it is a form of patterned experienced.

The more connections among processing units, the more consciousness.

There is never "more consciousness" in the way I say it. I think we're differing in our use of the term. In my take, you'd mean something like "an increased ability to be aware of things and manipulate them". Something like "greater awareness of things". All information processing does is transform one pattern into one or more different patterns. It does not change the 'stuff' that patterns are made of (which is "consciousness").

Free will is dependent on which perspective you are viewing things from. Someone standing in a 3-dimensional perspective would have free will in 2-dimensional world, although they would not be able to experience their 3-d will via their senses (they would only see the 2-d results and have to infer their intentions from those). From a 4-d perspective, the actions of the 3-d being would be predetermined. In the limit, it is a static universe and there is no free will because there is no movement. However, that's not how we live our lives; we take a trajectory across all possibilities, and if we can choose our trajectory based on our present position, that is sufficient.

The question is, what dimensionality are we?

Q3: I have no idea what you're talking about. Try to stick to falsifiability and scientific rigor instead of going off on New Age speculations. I respect your intellect, but pseudoscience bugs me. :3

Ha! It's not pseudoscience, honest. :-) Just trust me when I say that, even if I'm talking 'off plan', I'm trying to use metaphors to describe something I'm thinking, to explore the topic; I'm not saying it's a finished idea to be tested! :-)

Anyway, I think -

The problem is that we will never be able to come up with a falsifiable model for consciousness if it is the fundamental thing prior to space and time - because all our experiments will be in terms of it. It's a matter of metaphysics, rather than physics. If we don't introduce it at a fundamental level, then we are left with handling emergence. And by "fundamental" I mean it has to be introduce before any patterns - i.e. before any information. And in the end, it must join together scientific theories and personal direct experience, other wise it's just another nice diagram for the collection.

The dimensionality stuff: A bit of fun inspired by Flatland. But it probably is an important perspective to keep in mind when dealing with 'how we act'. We can only experience the result of our actions; we can't experience ourselves causing them. On a simple level, you can't experience yourself causing your arm to move. And no, describing 'brain signals' doesn't help - that's on the same level of explanation. (Why is why free will is discounted, of course.)

...Interesting how we differ! :-)

...experience of will and consciousness is actually equivalent to brain processes, arising from them and inextricably connected.

I don't believe this. I don't think we ever experience ourselves willing or (better to say) intending. We only experience the results. I don't think consciousness has a structure, although can be structured. I think intention shapes consciousness (non spatially, non temporally) and that shaping is reflected subsequently in the body. If we put aside "arising from" then perhaps we can get somewhere. The brain is the 'image' of the local experience, at that time. Intention is not an experience. Missing this point is why all those free will / response experiments are a misguided waste of time; the intention had already occurred, we do not operate ourselves manually and in detail.

I believe that within my lifetime the technology will become available to transfer my mind and consciousness to an artificial structure...

I don't believe this either - well, not on the current trajectory. And I think the problem will turn out to be, that your "conscious perspective" doesn't actually have a location, but it can have its attention focused on something. We might be able to create the structures, but at present science is completely ignorant on consciousness (rather than the content of consciousness). If you create another brain, you will have recreated the content of the experience, but you will not have transferred the experiencer. How to you transfer the experiencer (or transfer yourself), when it is not made from anything? Perhaps via an OBE?

That'll be the problem to solve.

It would be the ultimate medical advancement though - mixing the mechanical and the metaphysical, creating new vehicles and using 'spiritual practices' (I say smiling) to transfer yourself.

It's simple enough, to transfer one mind to another brain. First copy the structure. Then, via nanotech or some sort of neural implant, connect the two brains together, and keep them connected for a long period of time until the subject's every experience, thought, and emotion is reflected in both brains equivalently. Then put the original, flesh brain to sleep. The computer brain, however, will still be awake - one's mind and consciousness will have been transferred.

Um, I don't really see how that would work. Consciousness isn't ciphenable surely...

And if the brain is my "image" in the world, then creating a duplicate image at best just creates another perspective with the same formatting. If I am to switch myself into that perspective, it can't be physical so a connection wouldn't help.

...

Its all about relative perspective isnt it? Asking yourself does it REALLY matter?

Uh-huh, more specific? What really matters?

Control vs Letting Go

What are our opinions on trying to control our world and environment by technique and will (direct approach), versus letting go and undoing ourselves to achieve greater clarity (indirect approach)?

In the end, both approaches seem to have the same aim (a mastery over experience, or an expansion of it), but they are quite a contrast in path.

Do we have particular ideas on one vs the other, and how to approach each path?

...

A1: To try and control the world [external reality] demands continuing and varying efforts, and leans on the ego and self. Say someone was bullying you. Calling you names and such. You could try to engage that specific incident of bullying via magic, and manipulate the external world to stop the bully. But odds are another bully could come along, and you'd have to start again from square one. By operating internally the bully is no matter. There could be 100 bullies and it wouldn't make a difference... because you've change yourself. Either in a way that you aren't bullied at all, or that you've moved beyond the external and you are no longer concerned with it. Same with financial troubles. Every time you have a money problem, you could try and focus on the external world to enact change for that specific, localized issue, and solve your problem, but money problems can come again. If you work internally, and let go of the external world, you find an everlasting solution so that any number of independent, localized issues could arise without concern.

I think that the ultimate solution is to achieve internal change. To work only on yourself. If you achieve that, there is no need to concern yourself with control.

Yes. This is actually what I've come to think: The "external" experiences, or unfolded objects, arise in alignment with your enfolded forms (beliefs, assumptions, expectations, character) just as your thoughts do. You can fight the unfolded objects, again and again, but they will just re-spawn, because you haven't tackled the "facts" of the world. Amend the "facts" (your enfolded beliefs and mental posture), amend the phenomena. Whether this results in no bullies arising, or simply that bullies don't bother you, depends on the nature of the "fact" and its new version?

If I suffer from headaches and neck pain, I can keep taking painkillers to change the experience (object to object), or I can notice my bad posture, and change myself > change the experience (form to object).

No need to control the objects, if the underlying forms have been tackled.

A2: As a witch, there are too many effective techniques to not try external change, and they're easy too. Granted, tons of witches get stuck here, called 'practical magic' and never use the craft to expand their own spirit or spirituality. Internal change is for those seeking enlightenment or betterment of the soul. But it is also really and truly effective for things you don't know how to externally modify. I've seen a lot of schools of thought, occult and religious, who think you should internalize only, but for some, and perhaps this happens with women most of all, we've already internalized the blame too often and too much and so going in is actually harmful. Change is always the goal and a good one, and not the seeking of blame, but sometimes, we have to trick the brain into seeing one source as the culprit that is healthy for us as well as effective in changing the whole situation. I like to look at it like a web of connections, where a situation is brought about by a number of circumstances and the craft usually makes you focus on one, inevitably changing the pattern and whole chain.

Thanks, that was a refreshing new angle for me.

A3: Speaking through a few years of martial arts experience:

Pure control is like the hard styles, karate, taikwondo, etc. An opponent/unwanted situation comes at you and you deal with it directly. Break his arm, get your way. This way is generally effective and has the advantage of not taking a long time to learn. However, you're at a disadvantage against a person/situation that can overpower you. Pure letting go is like the internal health practices, like qigong or tai chi the way it's practiced in the west. It focuses on making you healthier and health translates into strength and general wellbeing, but by itself it's not going to be much use when shit gets real. It might help you deal emotionally with the consequences, assuming you're still alive.

In between you have a whole spectrum of arts that try to combine the two philosophies. Aikido, wing chun, krav maga, many others. Don't fight force with force. Get off the line of attack. Hit to weak targets.

In general: Adapt where you can in order to be more effective at getting what you want. Let go so that you can control.

In general: Adapt where you can in order to be more effective at getting what you want. Let go so that you can control.

Great. I've done some qigong, and found it very helpful. I still don't fancy my chances in a random bar brawl, however.

I guess, engage the flow of circumstances as much as possible; insert a 'controlling adjustment' where opportunity arises but only if required.

A4: I was taught that the external world could be changed only by changing your internal frame of mind. For example, your beliefs attract situations or experiences to you. By changing your ideas about a situation you can actually change the situation. By trying to resist a situation or fighting something, you can sometimes just create the opposite of what you want.

Interesting. Do you have any personal experiences where this happened?

A4: Look into thaumaturgy and theurgy. You are essentially asking what the difference is between the light side and dark side. Right hand path and left hand path. Of course there are other paths. I have found the right hand path always succeeds whereas attempting to manipulate circumstances may not always bear the expected fruit. However there are times when it makes sense.

Thanks for the tips. I really like that idea; the terms are new to me.

I'm likely mixing it up with both: one as a means to the other and back again. So it makes sense that there's the continuum. In actual fact, I'm probably of the view that editing "me" is how I make circumstantial changes anyway. (Because, fundamentally, what else is there?)

A good example I can share happened recently. I was very angry with someone because I felt they were treating me unfairly. Then I realized that this was just my idea about who they were, and it was just a belief. When I got rid of the belief I saw the person as a person just like me, and we were able to get along fine after that. When you really change those deep beliefs, magick happens. But only if you believe it will!

Did their behaviour "seem to change" afterwards as a result?

The two aren't contradictory, perhaps we could interchange control with will here? It could be one's will to engage his/her world and environment by technique and will. You don't have to choke every aspect of life to death to get what you want.

Control maybe better phrased as "holding on" in that case. With "will" just the occasional redirecting of yourself/the world.

That way it's a balance: Always having the open, "let go" attitude - with occasional "re-targeting" ?

A5: To paraphrase something I have read, "To take a step forwards in the outer world, take an inner step forward. To step forwards on the inner, take a step on the outer." So for example if we wanted a payrise, maybe the work we have to do is not external but an internal attitude change. If we want to overcome an addiction or some other inner 'problem' maybe changing some aspect of our external life is the way forward. I find as I let go and 'undo' as you put it everything falls into line for me. On the other hand as this happens I also am put in circumstances that cause me to grow and learn and let go further. Perhaps as I let go the blocks and tension are released also for me to work through. Maybe this is the cause of contraction into a state of 'control'. I think as we let go we 'control' our world with a gentle touch, like seeing a master of his trade making his work look easy. Technically the state of deliberate control is in opposition to almost every school of enlightenment and spiritual growth. I mentioned this in a post a day or two ago, if you let young kids choose their day it would be a trainwreck after one or two days - they really don't know what is best for themselves. Maybe think of it like a relationship, is a controlling partner ever an amazing partner? Be a good partner to life and the outer world. Give and take, nurture, forgive, teach and learn. Help, heal, sooth and discipline. Life has been around for billions of years, us as 'egos' a few decades... I'd say life knows what's what. I'd also like to say thank you TriumphantGeorge, I love your posts and I click on your name whenever I see it to drink of your recently spilled wisdom. Thank you.

On the other hand as this happens I also am put in circumstances that cause me to grow and learn and let go further. Perhaps as I let go the blocks and tension are released also for me to work through.

"Put in circumstances", yes. There is an interplay between the inner and the outer, which I guess goes back to the idea of one being a reflection of the other.

Be a good partner to life and the outer world.

I love that metaphor: **Working in partnership with life.**

It's very tempting to constantly fiddle and manipulate yourself/the world, pushing yourself along, "end-gaining" - but that has the side effect of fogging your vision of who you are at that time, and to the way things are naturally flowing at that moment. Spending most of your time watching, listening, being, doing, with a small intervention here and there - itself coming from inspiration - is much more effective. I come to realise the hard way! :-)

Thanks for the compliment; much appreciated!

I think that "letting go" is more a means of altering self to more easily fit in with world, whereas "control" is altering world to more easily fit needs/wants/desires of self. Therefore I don't see "letting go" as attempted mastery over experience. But that's just what I've found to be true in my own life.

Hmm. And perhaps "letting go" as both a way to allow experience to flow more easily, and also to (ironically) make "control" easier, as you have reduced inner-conflict.

TriumphantGeorge Compendium - Part 4

'No Precise Programming' - Subjectivity & Science

Article that's interesting [http://www.manasjournal.org/pdf_library/VolumeXXXII_1979/XXXII-22.pdf] on Theodore Roszak and linking objective vs subjective science. Sample quote:

I would like to help you gain an appreciation that came to me only slowly, painfully, and with much difficulty: how our intellectual concepts and beliefs limit our ability to perceive what is really happening in the world. When the world "was" flat, the heavens "had" to move around the earth. We see the world through the blinders of our own beliefs. When the world's behavior resists our expectations, as now seems to be the case in many areas of policy analysis, we need to question whether some of our important beliefs are in accord with reality. Unfortunately, our most basic beliefs are seldom accessible to our conscious mind: they appear to us as simple, unquestionable observations about reality. . . .

To truly see that one of your own beliefs is just an assumption can be liberating. This experience, though, is not amenable to precise programming. You must stretch your mind, envelop your beliefs with contrary thinking, and allow your imagination to roam in forbidden territory without automatically rejecting its perceptions as "absurdities." . . . By holding fast to certain beliefs, you may be denying a part of yourself that would come to the surface if you were willing to accept a somewhat different set of values or beliefs. . . . What I am suggesting derives from a belief in the indivisible unity of life and, therefore, in the importance of making work an integral part of the whole. . . . To be able to integrate your life, however, you will first need to re-examine your unquestioning belief in the superiority of "objective" over "subjective" research, a belief apparent in your condemnation of what you consider subjectivity in my writing. Until you relinquish this belief, you will be afraid to approach work with feeling as well as intellect for fear of losing your much-valued objectivity. But, pure "objectivity" doesn't exist, since any observations, experiments, or analysis must always be done by a person, who inescapably must have values, emotions, and feelings that influence his or her work. . . .

You seem, however, to believe that because you desire to be objective you will be immune to those passions, prejudices, and dominating opinions which "are the abundant source of dangerous illusion." [Laplace.] What nonsense. I am sure that Laplace would agree with me that those most likely to be led into dangerous illusions by their emotions are those who would deny most vehemently that emotion played any role in shaping their opinions about "objective" truth. . . .

I have no desire to deny that my views of the world influence my work. You term this "subjectivity" and denounce it soundly. I term it "wisdom" and recommend it highly. By drawing on all of my perceptions of the world, I believe I obtain a more complete and coherent view of the world processes that are unfolding than would be possible if I limited myself to information that I process intellectually and analytically. In a sense, I work backwards from my overall view of the world to the specifics of a given problem, applying tests of logic and evidence to check the correctness of the perceptions derived initially as well as from thinking.

-- Vince Taylor quote, No Precise Programming, Manas Journal, Volume XXXII 1979

...

I highly recommend people start writing, speaking, and thinking using E-Prime as a way of internalizing this message. For more information read Robert Anton Wilson's great books on model-agnosticism such as Prometheus Rising and Quantum Psychology.

E-Prime is indeed fun. And both those books can be found at the Principia Discordia site here, for those interested. Also, simply "taking a step back from yourself" mentally can be a great help, the "I" seems less like a "me" - letting the verbs breathe, as it were.

Fantastic find! Belief has long been the cornerstone of my research into the occult.

For me also.

In fact, I think the self-reinforcing feedback loop of experience with belief or "memory" (in its loosest sense) is fundamental to the ongoing moment, whether occult or everyday (like this, for instance). It's rare to see this relationship referenced in a more mainstream (and readable) perspective though!

Change the memory, change the world?

EDIT: Credit where it's due: I found this article via a comment over at the Metaphysical Speculations forum - worth a look [<https://groups.google.com/forum/m/#!forum/metaphysical-speculations>].

Thx for the image and for the forum. Ive never considered Belief and memory as intrinsic but that's what it is, some combination of memory and perception. Thanks!

We literally experience our beliefs as true, because our beliefs structure (seed) our experience, and back again. Sneaky eh? :-)

Cheers!

Manipulating Precog Dreams

This is a follow-up to my post on Ian Wilson's You Are Dreaming ebook [<http://goo.gl/LsKUUh>].

There's a short interview with Wilson and Robert Waggoner in Dream Views which gets straight to the meat of it: how changing a precog dream can change the outcome:

[<http://www.dreaminglucid.com/dreamspeak/DreamSpeak%2055%20Ian%20Wilson.pdf>]

Quote:

It is all intent. There is no other means by which we can direct and focus our thoughts. Intent and dream control would be the best descriptor for this technique. If dreams are anything, they are organized thoughts.

Which implies that perhaps the dream part isn't so important, that asserting an outcome with intent while in a suitably detached state would work also - i.e. The mechanism of magick is dream control. A nice quote on communication:

That truth has to be experienced to be realized, it cannot always be handed to you. Each of us must find our own gold, our own truth.

Direct, Simple Magick

Has anybody had much experience with trying to simplify their approach right down to the basics - a sort of post-Chaos approach? Although there's much fun to be had chatting to entities and following rituals, is there a way of cutting this to the bone?

Alan Chapman in his book Advanced Magick for Beginners:

Could this mean that what we use to represent our desire is arbitrary? And what does this say about the sigilisation process, and therefore magick itself? It doesn't stop with glyphs; instead of a geometric doodle, you could use a number, or a combination of numbers. Or how about a word, nonsensical or otherwise? What if we decide that a gesture represents your desire instead, like a wave of the hand? Or some other physical movement, like a dance? What if we decide that a certain dance means it will rain?

In other words, our acts mean just what we decide they mean, magically speaking. Later, he suggests that altered states are just ways of circumventing doubt or poor intention (e.g. effectively unintentionally requesting "I will want a new car" rather than "I will have a new car") and are not essential.

Any experiences?

...

Q1: Many of the zen masters caution against getting attached to Siddhi. Which are basically magic like powers that are obtained through meditation. I can't think of anything stripped down further than Zen. However, it seems like even more work than traditional ritual.

I think the warning to remain unattached is so that you continue on to your final destination, that of enlightenment. A problem in all approaches. I don't think it means they're bad in and of themselves. Reminded me of this Douglas Harding interview, the 'headless way' guy:

KP: But you would not deny that certain disciplines, if practised arduously at great sacrifice, can lead to fairly extraordinary experiences, but they're simply experiences, and we are over-looking the experiencer?

DH: Oh yes, indeed, and one of the traps, one of the side diversions of this whole thing, is at a certain stage to cultivate the siddhis, powers, that do come with the seeing of who one is— and they do come. And it's different for different people. Some people get a good old helping, others don't. But that's one of the snags, one of the diversions, and it's a very serious one.

But I see that as a little different to doing intentional magick, as we commonly think of it? I'm thinking of what 'act' we perform for our magick. How does one use the siddhis, once accessed?

Q2: I agree with Alan Chapman's quote 100%. However, there is a difficulty there. In principle what Alan says is exactly right, and I say the same thing often too. But in practice our minds are more inclined to make some types of associations than other, and depending on what sort of results you want it may pay to work with the grain as opposed to against the grain. If you want mental flexibility above all, working against the grain is the best practice. But if you want quick results at the cost of possibly habituating yourself even further into a narrow conception, then the fastest way is to go with the more intuitive associations. So for example, the third eye is associated with paranormal sight. The natural place for it is between the eyes. So if you want results faster, working with the assumption that your third eye is located between and slightly above your two human eyes is easiest. However, if you want mental flexibility, you might locate your third eye in the back of your head on Monday, than on Tuesday you'd locate it in the palm of your right hand, and left on Wednesday, and so on, and then on Sunday you'll locate the third eye nowhere at all, and use it in its perfectly abstract and dissociated form. This way you don't have a steady location to work with. The results will probably be harder to achieve at least initially, because this will likely go against the grain of intuition at first. But for the sake of mental flexibility such approach is superior. I myself strongly lean toward mental flexibility. For this reason I never work with traditional chakras or some well-defined third eye and other things of that nature. And if you notice, various systems of magick do not completely agree among themselves on the locations and the numbers of the so-called "energy centers" anyway. This isn't a coincidence. It's a reflection of the nature of mind. (Nor do they agree on the number and types of deities and so on.) As far as experience goes, I never felt like I was lacking something or like I was shortchanging myself by following my path. I think people who stick to the dogmas are the ones losing out in the long run, although I can certainly see the short-term advantages of doing the obvious thing.

Really interesting. I tend towards thinking that your 'mental objects' are pretty flexible in terms of structure, purpose and location. You can Chapman-like just decide-and-gesture, but sometimes it's nice to create something repeatable - basically, create a 'new habit'.

In the end, it's 'whatever works', but if you want to accomplish more dramatic things, then you'll likely have to create some sort of 'mental format' to prove it with a route by which to take place, since the 'standard habits' don't lend themselves to it very directly.

Q2: Drama is in the eye of the beholder. And habits to my mind involve tradeoff. On the plus side, habituated patterns become easily repeatable, and eventually repeatable even without conscious involvement, if needed. On the minus side, habits tend to slip out of the view. Habits tend to drift toward the unconscious regions where they can hide well past their expiration date, limiting experience well beyond their intended duration.

Good points all.

Q3: Everything is arbitrary. I know many people will disagree, but I believe all that any ritual does is convince your subconscious to place faith in your Will, which empowers your Will to change the world around you. I used to do lengthy traditional rituals to do what I now do in a short visualization bolstered by a short improvised action. The results are the same, if not better. If I don't have faith in something, I come up with something that feels powerful enough to overcome it and 90% of the time it does. I relate magick to my art training: at first you must trace things and fill in lines to learn how your hand works, then draw from life to learn how the world looks and how to recreate it, then you can draw absolutely anything you are capable of imagining. Magick is art that you create in the mind of the universe.

Magick is art that you create in the mind of the universe.

That's a nice turn of phrase.

what I now do in a short visualization bolstered by a short improvised action.

I think that gets to the heart of it. You can just declare to yourself that clicking your fingers means 'this', click 'em, and you're done. In fact, short processes leave less space for doubt and 'wishing for wishing' errors that can occur in longer, more involved approaches.

Our problem is often that we want to feel ourselves doing something to make things happen. This is a problem for daily life too: people tense up their muscles in order to feel that they are really putting effort into their work, even just walking and so on, when what they are in fact doing is blocking the natural flow by doing this - just intention is all that's required; the rest will 'do itself'.

“When you stop doing the wrong thing the right thing does itself.” - F. M. Alexander, inventor of the Alexander Technique for body movement

Q2: You can just declare to yourself that clicking your fingers means 'this', click 'em, and you're done. From the point of view of getting the world to change according to your will, it's far more important not to have inhibiting, contradictory and blocking beliefs/commitments/expectations than how you focus your will. In the absence of inhibiting volitions every ounce of will is effortless and 100% effective. For most people their volition is so strongly committed to ideas that inhibit magick, that they need some kind of trick to overcome the 90% of themselves (or more) that doesn't want magick to happen. People value stability and predictability that comes with solidity of experience. As long as that's the case, magick will remain difficult, and tricks like ritual and formal meditation will remain popular. Formal meditation is in principle unnecessary and neither is ritual. But we rely on those approaches because 99% of our being says that what we want to accomplish shouldn't be possible or is bad for us.

One thing I have been looking into is Dream Yoga, with the practice of gradually getting yourself to feel that this waking life is a dream (as opposed to just think it or something like it). I see this as maybe a nice way of dissolving those inhibitory boundaries: crack the experience open completely to all possibilities.

I find experiments and comparisons with lucid dreaming are often helpful, because of how 'intention' seems to work in that environment, it's the 'ideal version'.

Q4: A stable mind can get you anywhere you want. That's quite a challenge though - dropping everything and staying focused on a clear goal. But then the question comes - what should the goal be?

Q5: You just have to get focused for a bit until the spell is cast. Also not muddy the waters too much by obsessing on it afterwards -I think you end up kind off casting and recasting small spells when you do that- which is why forgetting about it helps a lot. The hard part is definitely to know what to wish for. Many times you yourself get changed in the process, and you can also get a lot of stuff happening peripherally to finally

get to the result.
Those days I mostly enjoy things as they are except if I'm in dire need, the upheaval a spell can set in motion just tires me. Or just ensure that there are easy ways of manifestation. Else it can gets way convoluted.

You make a good point. If you mostly let things alone - but pay attention - I think the things you actually want mostly come up 'by themselves'. The trick is to have the courage to follow through on any 'inspirations to act' you might have.

You and the rest of the universe will unfold as a single movement towards your goals - however you have to not hold back from your part in the movement. Often your involvement or role can be super-minimal, simply saying "yes" when offered something, but you must fulfil that role.

And on goals: Whether we write goals down or not, they are implied within us at any moment. (If you write down a goal or think it up, where did it come from? It was already within you, acting through you; you just made it conscious is all.) However, if we are conflicted then perhaps explicitly deciding via an act can help push aside any blocks we have.

TL;DR: If you stay clear-headed and allow spontaneity, then passive magick will likely give you most of what you really desire.

Q7: First, when it comes to physical result, every magick is an indirect approach to get the result.
However, the ritual with more physical element should give you more probability of getting a physical result.
Example 1;
If you strip the ritual down to just the desire alone, that's just daydreaming.
If you write your desire down on a piece of paper, that's motivational writing.
For example 2,
If your life is a mess, try tidying up around the house.
I love reverse-engineering rituals, stripping all the fluffs, leaving just the bare essential. It's intellectually enjoyable but it can be like taking protein pills when you want a filet mignon.

But... stripping things down and knowing this can be done then means your free to build it all back up again for pure enjoyment, knowing that the details are not actually essential. That can be quite freeing?

Q7: Yes and No, we can strip things down and (hopefully) go straight for god's G-spot every time. But sometime, we want the foreplay or role-play too. Freedom is to be able to do whatever ritual we want, whenever we want.

Yeah, I'm with that. There are also benefits to doing things in a group. There's sometimes a bit of an issue as to whether you 'take people with you' when you make a major change.

Q8: I do pretty much basics only (plus some specialized "tricks" every now and then, but they rely on the basics heavily as well).

What do you count as "the basics" for you?

Q8: Symbol creation and use (sigils), mantra creation and use, direct- or energetic visualization of something happening. Changing and holding the mental posture (as one website quite nicely put it). Sensing stuff with different senses (I use mostly touch and sight, sometimes sound... I've still yet to learn to completely trust that "gut feeling" type of intuition). And of course some breathing techniques, but they're more for my physical practice than for the occult side usually.
Those are pretty much all the building blocks I use to do my stuff. Even the different kinds meditation can be mostly classified under mental posture thing. I also use physical movement sometimes to enhance the visualization if I'm having a not-too-sensitive day.

"Holding the mental posture"... yes. Stealing things from other subjects, like acting for the idea of the 'Psychological Gesture', can be useful.

Q8: Actually, it seems to me like we're talking about different things; like this explanation has somewhere
[<https://web.archive.org/web/20111101072407/http://www.magickofthought.com/start/>], holding your mind in some way is what I meant. Still, it was an interesting read with the hollywood occult. ;)

Ha, I love the idea that all those blockbuster movies with heavily choreographed action may in fact be Grand Workings. :-)

The gesture was an idea for reliably accessing a 'state' or 'posture' by associating it with a mental or physical motion, just as actors do for emotions. A bit like NLP anchoring I suppose.

I follow that blog occasionally. It's a pretty interesting approach, although I think it may be layering on the structures a bit heavily. And I don't agree that it aligns with 'materialist reductionism' as the author seems to think. Not that this matters really, if it works.

Q9: I don't get it, magick is so simple and yet people get so caught up. Taking a shit? It's causing change in accordance with will. Last time you got a date? Last time you filled up the gas tank? Last time you ate? Without simple magick you're dead, are you dead? Am I? There's your answer.

Sure, there's a sense in which you and the universe work by magick; it's just 'how it all is'. Your thoughts and actions arise spontaneously in the direction of your implied intentions, and the environment around you tends to conspire and adjust and bend accordingly also.

The point here is that lots of people put a load of effort into doing two things:

1. Deciding on what they think they 'want', on 'goals'.
2. Coming up with something to 'do' to attain those goals.

Really, though, these two points are about becoming conscious of things that are likely happening anyway.

First, just because you've not pondered and written out a goal doesn't mean it isn't "in you" already (otherwise, where would the though and the writing come from?). Second, if your goals are implicit in your character at each moment, then in fact all your actions will be aligned with your goals. And if we take the view that "you" are not separate from the rest of reality, then actually the whole universe is moving towards you experiencing your goals.

Unless you actively resist and get in the way.

...

Q6: But that's so booooring.

Okay, tell you what: I'll still let you wear a silly hat. But only on Tuesdays.

Dramatic Effects

There has been some discussion here and elsewhere on the the influence of beliefs and expectations on the 'available routes for manifestation' for a magickal intention.

Meanwhile, some people quite dramatic random occurrences, appearances and disappearances and changes in their reality, and wonder how to harness this.

/r/occult people, what are the most dramatically direct results that you've had from an intentional working? And how do you think the situation differed to the more usual hum-drum 'roundabout coincidence' type of result?

...

Thanks for that. Lots of people seem to report that their first efforts, and when they started taking it seriously, was when a "curse" worked (see here [\[Deleted\]](#) for a similar example that got me thinking about this, not my own). Suddenly you realise that with magick: a) It works, you get what you asked for and, b) It works whether or not it's a "good" thing you've asked for. It's a harsh lesson to learn. Did you try to undo it once it started to happen? (Most people report they couldn't bring back what's been sent out, only re-intend something else afterwards.)

Extra thought: Is it really possible to have something happen to someone if they don't let it/want it somehow?

I love the idea of "re-intending". I am a devoted fan of Neville Goddard, who often spoke & wrote about "revision". He taught that our world is created from our imaginations, and "whatever we can make, we can unmake".

I also tend toward the "there's nothing out there" school of thought, so it seems to be a matter of just controlling thought/feeling, and only that. Is it simple and easy to do IF we believe it is????

"The world is yourself pushed out", as he would say.

Well, for convenience of imagining this, I have a little diagram I quite like.

Think of the "ground" as containing enfolded structure - traces of previous experiences, basically. This evolves and updates automatically: as experiences arise they leave traces which in-form subsequent experiences. Thinking also leaves traces, because it occurs in the same space. This leads to what we call "beliefs and expectations" or habits. Memories in the most direct sense.

Normally, people just get lumbered with whatever happens to form structurally as their "ground" or enfolded structure. Magick, however, is the realisation that you can re-form this ground directly via intention - and so doing, change the form of objects (spatial and temporal, things and narrative) that will subsequently arise as the "content" or unfolding structure of experience.

I also tend toward the "there's nothing out there" school of thought, so it seems to be a matter of just controlling thought/feeling, and only that. Is it simple and easy to do IF we believe it is????

So, yes, there's no-thing out there. What you are experiencing right now is basically a sequence of "mirages", the form of which is dictated by the profile of the dunes on the desert floor.

You don't need to control thought and feeling all the time, mostly just let passing thoughts go. Occasionally, you deliberately summon a particular experience in mind with intention, and thereby update your structure - i.e. insert new facts, draw new shapes in the sand. A fact may be now or it maybe a fact of the apparent future. It's not ongoing control, it's occasional updates, and completely letting go - not interfering at all- in between those updates.

This is great news: Mostly, you just sit back and enjoy the show in all its multi-sensory surround-world gorgeousness, unfolding spontaneously and automatically. Now and again you decide you don't like the direction this is going in, and you re-direct by inserting a new fact, setting a new target, and then let the unfolding head at that new angle.

EDIT: Neville Goddard's nightly "re-imagine the day as it should have been" exercise is exactly this. Restructure yourself each evening such that tomorrow begins from the ideal, enfolded starting point.

Q: Thanks so much. I love that. Also, just happy to see someone on this sub knows about him. I actually had made a longer entry in reply to (and with great sympathy for) BarefootDorothy, but then deleted it. ()(See asterisks below. :)

We are so much more powerful than we realize, and when we begin to stir things up with things like meditation/focused intent, we'd better have some idea what we're doing. In my experience, any kind of "awakening" that occurs when negativity is allowed to abide can be a recipe for certain calamity, unless one changes one's course. I've created a-MAZ-ing circumstances, both desired and undesired. (Time warps, flabbergasting synchronicities, extreme changes, all that stuff.)

Two "kicks in the head" I can point to: "Instant Karma" (they weren't kidding!!) and "the boomerang effect". I would tell you stories (one is even sort of funny, in retrospect,) but... one reason I'm beginning to think I will probably leave these sites behind (even GITM - we'll see how addicted I truly am or am not!) is that my most serious and delicious endeavor right now is **()divesting myself of my "stories" ()**. It's wonderful - but you probably know that!

Your posts have been really instructive and you've provided much food for thought! I thank you, Sir. (I assume you're a "Sir", but no tellin' on these sites! You could be someone's cat, for all I know!)*

You could be someone's cat, for all I know!

Quite probably. It would be worth it for the teleporting capabilities! I might look into it as a possible career move. :-)

As you point out, the speed with which things arise can be quite astounding. If you don't realise what you're doing, if you aren't making knowing decisions, it can get quite out of hand pretty quickly. You really gotta remember, "it's all you".

Yeah, you're right about those asterisks!

The reason to be in these forums is to explore your own thoughts and maybe in the process other people get something out of it too, which feeds back to your own thinking. Eventually, though, there's nothing more to be said!

Good that Neville G is getting a bit of exposure. He got the fundamental thing right (the 'felt sense' with intention) well before most people. Nothing wrong with a bit of theatre or visualisation, but it's good to recognise that it's just a means of indirectly adjusting your global felt structure of the world.

...

Anyway, I wished her fat.

I sniggered aloud at that phrasing! :-)

...

Q: Well, I've never tried to do anything outside of things that can affect my mind, but that's still had some amazing effects. I have a habit of going off on tangents very easily. It's impossible for me to get out of it on my own, and it usually leads to me blowing up at someone. Well, one day, while walking home, I was in another tangent over some conversation at school. Finally, I was tired of this shit; the constant bickering and damage in my head, so I mentally screamed "STOP!! At that moment, I got a strong vision of being surrounded in a whirlwind of fireflies. I'd never seen anything like it before, and it was beautiful. After they disappeared, I was calm, but tired. I felt like I had used an enormous amount of energy to get me out of that funk, but I still hold that memory clear. There was another time with sleep paralysis. My second night of having it, I had woken up to me being held in place by shadow snakes. I was terrified, but again I called out the name of a servitor of mine that tried to recreate the whirlwind abilities. This time, fireflies came to my rescue and started consuming the shadow snakes in their bright lights. It was a beautiful sight to behold, but less draining then the firefly tornado.

Go fireflies! Great imagery.

EDIT: Since the fireflies came to you naturally, you should try to utilise them for other things. Send them out on missions on your behalf. Don't drain yourself though by over-intending; let them take the weight.

Q: Oh, I've actually done that before. Looking back on it, the reason that the first time of making myself relax took so much energy out of me is probably because I had not created a servitor at that point. It's kind of the difference between breaking wood in half with your hands and with an ax. Incidentally, I also used my servitor to save my grandmother's life. Fr about a week, she had been in the hospital on her last leg. What's worse; she had given up hope and seemed ready to die. Knowing how good I am with hope, I sent my servitor over to her to let his light shine on her, to give her some of my hope. The next day, I got a call from my mom saying that she had a renewed vigor for life.

That's a nice story!

Faith, Natural Law, Control

"People lost faith in natural law itself. Nothing seemed stable or fixed; the universe was a sliding flux. Nobody knew what came next. Nobody could count on anything. Statistical prediction became popular... People lost faith in the belief that they could control their environment; all that remained was probable sequence: good odds in a universe of random chance."
-- Solar Lottery, Philip K Dick

A picture of our day, perhaps.

Has our modern world lost faith in natural law? Lost faith in the belief they can control their environment? Forgotten how, or even that you could? Become subordinate to the rule of numbers and of chance? Nobody could count on anything - even themselves...

(More thought-provoking PKD metaphysical meanderings here [<https://philipdick.com/literary-criticism/metaphysical-quotations-from-the-novels-of-philip-k-dick/>].)

...

It's not about controlling your environment. It's about living in harmony with it

Quite possibly! :-)

Many occultists, though, would say that they are interested in the subject because it offers the hope of having influence over their (personal) environment. Getting what they want, basically, or perhaps fashioning the world into a better place.

Do you disagree with that aim?

The quote can also be interpreted as meaning that people have forgotten that what they intend/think has power, and that by forgetting this they allow the world to become less structured, to drift.

If the environment actually depends on our individual and collective focus, if we let go - what is it we're living in harmony with?

Isn't that like letting go of the steering wheel of your car so that you can "live in harmony with the engine"? Or has the universe got cruise control enabled?

Wouldn't disagree, but controlling and influencing are quite different

Not a bad point, but where is the boundary? If I kick off a pattern and let it unfold - say - then occasionally make adjustments to it (influencing it), am I not effectively controlling it?

Just because it is not constantly within my grip - I don't need to do that because the initial creative process gave it a "momentum" - does not mean it is not entirely under my control. I create it, I tweak it occasionally to ensure it's still unfolding in a pleasing direction, in line with changing circumstances.

That's basically complete control, right? Is that a bad thing? Is there something special or particularly "good" about just letting the pattern run post-creation?

To nature, there is no structure.

No inherent structure, yes I would agree with this. The structure of our minds is the structure we experience as the "world", I might suggest?

"If the environment actually depends on our individual and collective focus, if we let go - what is it we're living in harmony with?"
Can you explain please? :)

But of course! :-)

Let's say that the world is a pattern (like a ripple in some water) that is gradually spreading out, unfolding, under its own initial momentum. If we simply leave it be completely, it will just continue uninterrupted.

But if some people unwittingly influence the pattern, it will become deformed and vague in its direction. The pattern will become less structured. The more disparate and unfocussed the unwitting intentions, the less coherent the pattern will become. It is surely inevitable that this will happen.

If everyone lets go and tries to "live in harmony" with that, the world as happens to and experienced by individuals will gradually fall apart, working in nobody's interests. As you said, "to nature there is no structure". So trying to just stand back and live in harmony with nature, let nature take care of things without actually directing it at all, would be a mistake. You cannot actually rely on the pattern of nature unfolding appropriately!

Therefore our participation should be active; we should all be consciously and deliberately shaping our environments, the structure of mind.

(Maybe. I'm just exploring ideas here to see where they go.)

...

Thought-provoking, thanks.

The thing I'd like to give you is that living in harmony is going with the nature of things. How things act, grow, speak, etc. It's not about resisting this flow, it's about choosing its many directions in which it flows and accept the consequences of those choices.

Well, that was particularly nicely put. :-)

I also liked the imagery you conjured in me of a family having to move house because a tree started growing in it. "Darned nature, at it again!", says Father, packing his bags for the third time in a decade. "This time, we're going to live on a barge!" ;-)

So, nature sees neither good nor bad, it just flows as it is flowing. We perceive good/bad, because we have preferences for how we'd like it to flow, from a limited partial perspective.

We are able to influence that flow directly - quite strongly in a local way (our bodies and thoughts), apparently less so in a wider sense of the apparent larger world (using magick or synchronicity). But to actively fight the larger flow as it is, is folly; it doesn't work anyway, except perhaps temporarily and as a delay mechanism, and leads to suffering. So we strike a balance, seek where to draw the line, as you pointed out...

Dominating in the sense of making something do against its nature or against its will. I agree, the line may be difficult to draw in some cases.

Some thoughts:

What we call "the flow of nature" or "the nature of something" is really just an accumulation of flowing patterns from the past. How did that flow began? How has it become what it has become? What contributions have been absorbed? Not questions that are answerable, but it is now as it is, and it is going in a particular (multi-dimensional) direction.

So, we cannot control but we can request - by submitting or contributing new patterns (intentions, wishes, prayers, rituals) to the flow - and they will be accommodate. How so? Because intentions change the shape of the mind, and so change the landscape of the world, and the landscape dictates the flow of experience. Nature flows through us, as us.

Finally, what dictates the extent of influence, the impact of our intention? Perhaps it is the extent to which we hold on to existing patterns, resisting change (basically, fighting ourselves when changing ourselves). Perhaps some patterns are simply too deeply ingrained to change within a lifetime, or are part of the body's life - such as the unfolding patterns of the body itself, or patterns such as "gravity".

There is also the view that our birth was the start of a pattern, and to let it simply unfold, to flow unimpeded, is to be the most authentic we can be to our own true nature. Our ideas about who we are and what we want cannot ever encapsulate this direct truth, which is acting to create our world at this very moment.

Still, it's fun trying. :-)

Unexpected things are totally natural and part of the infinite flow of the fundamental reality.

Unexpected things..

I guess the question would be: unexpected, by whom?
Not unexpected by nature itself, surely.

I understand and agree with your stance that nature "simply is," and does not pass judgement on itself. However, the fact that humans are able to make something like the periodic table clearly shows that nature has its own distinct dichotomies. In a solution of AgNO3 and NaBr, the two solutes will dissolve and form a precipitate of AgBr. Nature doesn't just say "do whatever you want," those two particular atoms will precipitate because of properties that make them unique. In a sense, nature cares greatly that these atoms will act in a particular way, separating them from other atoms that will act differently.

Nature doesn't "care" about this though, in a judgemental way, or even in a consistent way. Habits are formed, impersonally, and those habits persist, and those habitual patterns have subsequent impacts.

Perhaps that precipitate never formed until, one time, it did. And then a couple more times. And then it became an established habit, and mostly happened from then on.

What I'm getting at: Nature doesn't care-take, and it doesn't design or manage, it just kinda "ends up", perhaps? It looks like regularity and law now, but that's only from our perspective in the current state of ordering.

COMMENTS: Multidimensional Magick

*Q: Some say that Tesseract jumping is a better version of suicide, and should only be undertaken in the same circumstances. Some say it is habit forming and leads to permanent tourist syndrome toward any universe one finds oneself in.
What do you say about that? Very intriguing concept - I've never heard of this*

I'd probably offer some extra information: When "jumping" you are effectively allowing the structures and patterns of your experience to shift by letting go and allowing. This involves the enfolded "universe" of your mind, consisting of the environment but also the body and thoughts which appear to you. Any pattern that you don't "hold onto" can shift and realign!

This means:

- When you jump you are not just allowing the effective death of your original universe but also of the "person" you have been experiencing as "yourself" until this point. It is worth considering at what stage you are simply no longer "you" and have effectively committed suicide to be resurrected as someone else, because...
- Once you've jumped once, and seen changes, you will no longer be "home". Before, you accepted imperfections as just part of your solid external world. Having let things shift, you realise there is no such thing. Everything is up for grabs, and you can't go back now! "Tweaking for perfection" could become an obsession.

Sometimes, acceptance may be the better route since the balancing effects of narrowly focusing on one particular change after another might not lead to a beneficial result overall [<https://www.youtube.com/watch?v=8mdwAkWvWMw>].

I'm reading it more like 'the patterns you willingly release can shift and realign'

That's an equally valid way to say it too. The reason I phrased it my way was to imply that the natural state is of letting go and that "holding on" is you resisting change unnaturally. Perhaps that's how you ended up in an undesirable universe in the first place, by blocking the direct manifestation of your desires?

...it turns the concept of faith, something that's often so difficult to get past, into a given and makes one focus instead on what their faith produces. thanks for posting

Yes. I think it captures a few solid ideas into one handy worldview/system, including resistance, identity and True Nature and all that stuff. Had the links for a while but only thought of them again when I spotted /r/DimensionalJumping. (I've been experimenting more with a direct "enfolding, unfolding dreamlike mind-space" type format of late, but actually that fits in quite well with the Multidimensional/Tesseract symbolism.)

Anyway, glad you found it interesting too.

No participation reddit?

New to me too! [https://old.reddit.com/r/NoParticipation/] Seems like a domain-based way to restrict contributions to subscribers only.

words are the trouble, like usual.

Pesky words! Okay, I'm going to try and explain my choice better:

I'd say that you can only know what you are holding onto, not know what you are not holding onto - you can't make a list of all the things you you don't know you don't know - and that's the problem with this approach.

You might make a list of what you want to change. But those aren't the only things that will change. Anything that you aren't holding down will shift, subtly or dramatically depending on how extreme the main movements are.

Blanket Metaphor Time

Imagine the world was a blanket (yeah, I love the blanket metaphor) with loads of 'bumps' or 'folds' in it at different heights, representing the current objects of the world. You are one of the bumps, with a limited viewpoint. You've seen some of the other bumps, but not all. You decide to change the shape of two of the adjacent bumps you can see, while holding on to two of the other bumps. Great, yeah? Well, no.

When those two bumps change shape, say grow taller, they pull on the fabric of the blanket. Sure, the two bumps you are holding onto stay the same, and you get the changes you want, but everything else that falls outwith your scope in the world is subtly "pulled". Door handles may turn the other way now; the colour of Alfred's hair might be lighter; Nelson Mandela is alive yet again; Berenstoon Bears. No big deal?

Thing is, lots of other "folds" might have been teetering on the edge of more dramatic change. Several 'bumps' that were adjacent to each other are pulled into a single form, or one pushes into the other, collapsing it...

At the other end of the blanket to your bump/perspective, a chain reaction has started, the effects of which may not fall into your line-of-sight for days. All because you held onto (prevented the change of) one aspect of the world, keeping it static against the larger flow you have requested and so interfering with the normal self-consistency or "coherence" of the whole.

Summary

- We can list the things we are holding onto: that list is finite and within our perspective. We can't list the things we aren't holding onto: that list is infinite and beyond our scope.
- To make any change it is required that other things are allowed to change also, because each object is part of a seamless whole. Any changes that do occur "pull at" the rest of the world as part of the process.
- Artificially restricting change may destroy the previous narrative coherence and lead to more dramatic, unintended changes to compensate for it.
- It is therefore not possible to consciously control the details of the jumping process.

EDIT: Rejigged my description to make it flow better. Obviously, by making this change I may have inadvertently caused other aspects of the world to be altered. If the hair colour of your SO shifts overnight and they develop a hitherto-unlikely love of cornflakes & peanut butter for breakfast, you can blame me.

Q: that makes perfect sense - can't go wrong with the blanket metaphor.
BUT (you knew there was a 'but' coming) - how can you really 'hold on' to anything? As a made up example that hopefully illustrates what I'm thinking:
There's a boy named Tom, and Tom's life is shitty - objectively shitty. We're in an example here, so let's make it as bad as can be. He was born into a North Korean prison camp, and at that, for whatever reason, his position is as low as can be. He routinely gets beat, raped, starved, whatever you can imagine in such a horrible place. Everything is really, truly terrible, and trumps the worst that a 'normal' life dishes out.
Everything except for this certain bird that always lands on the barbed wire fence and sings beautiful songs. Tom gets lost in that bird's song, it's the only thing that gives him peace, or love, or hope or joy - maybe it's the only emotion that he feels, since pain and cold and hunger aren't really emotions. Imagine Andy in the Shawshank redemption with the opera song. Like that but worse, right?
For the sake of exposition, let's say that one day there's an older man dying and Tom happens to be around him while it's happening. He's pulls Tom close and tells him something similar to this [https://old.reddit.com/r/DimensionalJumping/comments/2ax00o/dimensional_jumping_for_dummies_revamped/].
Obviously Tom doesn't have much to lose, but he wants to hold on to that bird. What does he really know about it? Its song? The shape of its body? The way it makes him feel? How can any of these things be more than an 'imagining' and how to 'hold on' to such a wispy thing?
Even if he could - does he know where the bird lives? How and where it hatched? What it eats? If any of those things change - possibilities all of them, since no doubt he'll be wishing for a change of scenery to say the least - how can that bird still be there?
Example:
It's similar, in a way to Zeno's paradox - no matter how much you 'have' (there's an interesting wording) of something to 'hold on' to - the shape of the bird, it's song, the way it makes you feel, etc - you'll never have it all. There's always something missing, always something lost.
So - when you say 'you can only know what you are holding onto', and I think your argument for that was quite sufficient, what then? Tom knows that he's holding onto the bird, but how does Tom hold on to the bird?

Reply Part I

That was a nice piece of storytelling and a great point! Nice when a discussion teases out the issues like this.

To recap:

- What does it mean to hold onto something and how do we know what we are holding onto? And:
- If everything is continuous and whole then how can we hold onto a "part" of it? In other words, how do we define the perimeter of an object? Do we actually need to?

How does Tom "access" the bird and retain it in its current form when everything else is going to shift?

To answer this, we're going to have to push a little into the nature of the world. The blanket metaphor is handy for showing interconnectedness, but of course it implies a 'spatiality' that is not actually present. For this next part, we must dispense with it and realise that in actual fact the whole universe isn't out there, extended, but enfolded into the space right here - intended?

Have to go sort some stuff out. Part II later!

Reply Part II

(Readers: See Part I and the preceding discussion for context.)

Well, we're going a bit deeper than I'd initially meant to, but let's go with it and see where we end up, shall we?

Before we offer advice to Tom about his situation, I think we have to talk a little more about what the world is, how it appears to us and how we interact with it. Obviously, we'll still be trapped within metaphor, but with some juggling we can work our way onwards - and arrive at a practical approach for him.

Beyond the Blanket: Into the Desert

Where is the world right now? It is not “out there”. I suggest that the world is enfolded into the space right here. We talk of the conscious and the subconscious, as if the subconscious was beyond our awareness, unavailable and secret, but it is not. We are simply being biased towards one form of experience versus another as being “real”. We attend to sights and sounds and textures while ignoring another sense that we have: the background and ever-present felt-sense.

This felt-sense contains - no is - the world enfolded. It has no spatial or temporal structure but all aspects are within it. And what we think of as the present moment experience is simply an aspect or perspective of the felt-sense, unfolded into images, sounds, sensations.

Literally, we have a sense of the world and it turns out that this actually is the world.

One can think of the experience around you as a mirage that is floating above the sand dunes of a desert floor. We confuse the mirage with the real world, when in fact the form of the world-mirage reflects the shape of the sand dunes below.

We cannot interact with the mirage directly, although we may be fooled into thinking so; in fact, we can only change the dunes and see those changes reflected in the mirage. Although we might experience single moments as unfolded sensory experience, in truth we simultaneously have access to all time and all space via the dunes.

So, in everyday life we actually make changes by intending alterations of the timeless dune landscape. We might intend our arm to move right now, and it will, and we will feel that we “did something”. However, we could equally intend that our arm move tomorrow, and when tomorrow comes it will seem to happen then. Strictly speaking though, it was always happening that day, from the moment we intended it.

In our metaphor, the mirage is the multi-sensory present moment experience, the sand dunes represents the felt-sense, and what we truly are is the entirety of the desert landscape. When we intend what we are actually doing is shifting our own shape; we become the world we subsequently hallucinate. The world, in other words, is ourselves.

This accounts for its occasionally dreamlike nature: the apparently external world is in fact symbolic of our current state. Or to be more accurate, our current state is symbolic in nature. We don’t need to delve into this to solve our current predicament. Suffice to say that the objects we encounter are in fact meanings.

To finish off, we note that just as all objects were actually continuous forms of a whole in the blanket metaphor, here all objects are dissolved non-spatially and non-temporally into the felt-sense. The difference now is that our metaphor suggests a way we can interact with the world practically.

A. Can Tom hold onto the bird?

So, armed with his new metaphor, how can Tom change his situation while holding onto the bird that has given him so much comfort?

First we must decide what it means to “hold on”. This is easy enough now: since the patterns of the world are the patterns of ourselves, we simply need to intend - basically, just decide - that a pattern is going to persist. We do this accidentally all the time, by implication. (For instance, identification with something implies a resistance to change because you 'stand as that thing'.) Here, we are simply doing it deliberately.

However, importantly, one can only make deliberate decisions about things that are unfolded as objects in awareness. Tom can easily unfold “the bird” from his background sense and intend it will persist - simply by recalling it and making the decision. He cannot do so to aspects which have not yet been object-ified, though.

So, Tom decides that the bird will persist and then relaxes completely. He ‘gives up to God’ as it were, and intends that his situation shifts to the best possible one. With the bird still present.

B. Should Tom hold onto the bird?

The thing is - if the whole world is shifting for his benefit, it’s not clear he should retain the bird. The bird fulfilled a particular purpose: it gave him comfort when the rest of his situation was dire.

Now that he has allowed his situation to flow towards a better one, the bird will no longer have the meaning it once had. In fact, it is likely that Tom’s feelings towards the bird will be quite different. He might have gratitude towards the bird, but he no longer has a requirement for it.

Which sounds harsh. The poor bird!

But what is the bird anyway? The bird was its meaning - of hope and escape. It was the aspect of him that knew there was another way. The bird was his pathway to changing the world and with the world changed, the bird has no place. The bird was actually an aspect of Tom all along, and can now be allowed to dissolve back into his awareness.

Conclusion

A key word here might be "realignment". Why would we want a world which was part changed and part not, a partial alignment to a new existence? An incoherent world means an incoherent self and experience.

In other words, it is not clear that Tom should hold onto anything. Perhaps he should actually let go completely of all patterns in awareness - let the winds of destiny shape his desert floor consistently and naturally - if what he really wants is “the best thing for Tom”.

Afterword

So, how does this apply to the specific workings in the original post? Well, it suggests that the details of the working are a symbolic representation of >3-dimensional space, and stepping from one part of the tesseract to another represents a 'releasing into' parallel possibilities. In other words, the important thing is the understanding and opening to this type of change, rather than the details of the diagrams and so on.

The felt-sense I have described has no dimensions and no limitations, except those placed upon it by the intentions enfolded into it. Recognition of this alone will improve your experience of the world - i.e. yourself.

...

Right, I'm back.

I'll begin by saying that my original posting doesn't necessarily recommend performing Multidimensional Magick; it just points out an interesting approach. For me, it's as much about how it illuminates the nature of experience. With that in mind, we're going to push it to the extreme.

Why Jump?

It may well be that "stoic acceptance" is a better approach to life rather than expose oneself to an unpredictable process that one cannot fully guide. However, what would it mean to guide, to know in advance, what was going to change? We wouldn't actually want to have to go through each aspect of the the world individually and adjust it. The key here is to ask what the nature of the change is going to be.

What's really happening?

- We're letting go of the world so that it can shift.
- We're intending certain changes.
- We're allowing the world to shift to accommodate those changes.
- In the process of that accommodation, the world rebalances as a whole.

So, potentially we get something we want and simultaneously everything becomes more harmonious at the same time. The more we try to control the details consciously, the less coherent and harmonious the result is.

To ponder: What if we just didn't do the intention, and simply let go completely? Might that perhaps give us not what we want - but what we really, really want? In other words, the question might be not so much about whether we jump, but whether we control the jump at all.

It's not Solipsism

Solipsism is when we think the "person" we are is the only person on the world. This is something different. In one sense we are saying that the whole world is the person. Taking it a step further, we realise there is no "person", there are no "people", there is only the world. You and I are both the world.

It can be hard to reconcile this mentally with an idea of a "you". One approach is to think of each of us as our own dreamworlds, which are connected at some higher dimensionality. In other words, an intersubjective idealism.

For practical purposes, you can just treat "all this" as your dream, with you being the dreamer, the dream and all its content. The "person" you seem to be is a dream character, just as the other people you encounter. Since "everything is you", you will not behave solipsistically, you will not be cruel to yourself.

Tom Falls into the Mirror

All your ideas about changing oneself, bettering oneself, escaping oneself - all of those ideas depend on what one thinks of as "oneself". Without having that clear first, we cannot really weigh up the pros and cons of apparent suffering vs transformation.

One of the problems with Tom's story and our interpretation at the moment is that we are talking about "Tom" as if he is separate from his world. We talk of meaning and what the world means to Tom. This isn't quite the correct wording though: The world is literally parts of what Tom really is. Tom is the world; "Tom-the-person", meanwhile, is just a perspective and a collection of thoughts within that world.

When Tom sees war and catastrophe, that is not just a representation of Tom's inner turmoil, it is literally part of Tom, unfolded into sensory experience.

...what now? he's not getting beaten or starved anymore, but surely his sanity must be in tatters? we can assume he lands in a 'real' place. His mom is gone. In fact, to the world he finds himself in, it's as though she never existed. The thing which made his life possible is irreparably lost.

But the thing that made Tom's life possible was not "his Mother", she was just an aspect of the experience. What would happen in this extreme case is that Tom would be confronted with his true nature: He is an "aware space" in which experience arises.

He is not any of the content of his experience. He is the background in which experiences appear. He had forgotten this, assuming an external world and that tone part of experience - his thoughts and body sensation - were "him".

Was the jump worth it? Would he be God?

Being God: Would ya?

One worry people might have is that, effectively, this sort of magick implies that one can be God. More worryingly, it implies that one already is God.

Before they've thought about the implications, people quite like the idea of Infinite Power. Actually it might not be so attractive - it could get boring pretty quick. It's cheating. It breaks down what we think is important in our lives.

- If you could change anything instantly, without going through an apparent process, it means you could do anything and have anything. It would just happen. (God.)
- Or you might change things to you liking, but choose to forget that it was different - i.e. you deliberately forget that you used your Godly Power to update the world and make it nice. Just so you could enjoy it all more. (God + Memory Wipe.)
- Alternatively, you might say it's okay to have what you want and remember asking for it, but you're going have those things arrive through seemingly normal channels. In fact, you will have updated the world to get what you want, but you will experience it as happening via coincidence and opportunity. (Magick in the World.)
- Another option is to hide from yourself the fact that you get what you want. You simply always get what you ask for, but never realise it. You live a life of struggle and triumph, terror and joy, and only at the end will you realise it was your own creation; you were chasing your own shadows in a fictional grand adventure. (Powerless Person.)

At any point, one might "realise" themselves from one situation to another via insight. The Powerless Person might notice that, hey, something is going on here => Magick in the World. They might later realise they aren't a person at all, and are effectively the world itself! For a while, you become God. Then you get bored of that, and decide that you'll make everything ideal, but then forget that you did it (God + Memory Wipe).

Then you're back to Powerless Person...

Conclusion

Aurelius has it right. As he implies, the world is yourself pushed out. All change is to the self. Live from the perspective of a person, but understand this is not the case. Objects appear and disappear; they are patterns in experience. The universe is transient and it is made from meaning. But that meaning is you.

thanks so much for your response, and for taking the time to have this whole discussion with me and flesh out the bones of what this idea can mean. A proper reply later..

Well, it's a dialogue, so we're unfolding it together for the benefit of all!

Don't you think it's strange that there 'seems' to be a self-realization phenomenon on a global scale going on these days??
I decided to check this subreddit today after 2 months of constant synchronicities, "injected thoughts", visions and divinations and all too conveniently I ran into you and your posts!!
Eschaton? Noosphere? Universe reversing itself? Everyone 'awakening'?
What do you think is going on.

When you ponder it for a bit, it actually makes sense that there should be changes on a global scale. Although I always scoffed a bit at the optimism of this in my early days, think about it:

When you become clearer about things yourself, you effectively dissolve the boundaries between your personal self and the world (realising they are the same things). Meaning that the barriers between your own thoughts and intentions and everyone else are greatly reduced. If you have "realised" how things are, you help everyone else (also you really) realise the same thing.

So you're saying that all those steps basically get boiled down to: allow the world to shift

Once you look at what you're actually doing: yes. At first though, we might think we are going through various steps, thinking things through, deciding what we want (as if we don't already know deep down), choosing something then letting go, letting it happen. The four steps I listed. **But we only need to do that because we went off track at some point.** In the end, **what we're really aiming for is a state where we're balanced, and our desires and the world are aligned anyway.** No resistance. If we hadn't "fallen" at some point during our lives - started pushing and pulling instead of flowing - we wouldn't feel the need to do magick in the first place. Our world would be us, effortlessly, whereas currently its movement is busy fighting through our defences. However, while we still feel we've got things to "work through", there will still be stuff to "be done".

correct me if I'm wrong - you're going down a sort of Alan Watts path of "God playing hide-go-seek with itself"

Well, I don't really like that angle because of its anthropomorphism and I don't quite see us as a part of anything. But I'm struggling to describe it at the moment.

Is there such a thing as transformation?

There's such a thing as a change in perspective and identification. Do you think one should have to work hard for the goodies? Might that not be like rippling the water in the hope of clearing view to the bottom of the stream?

Implicitly there are different levels to these conversations: First, everything is as it is already, so let things be. You are already whatever you are, you don't need to do anything to get there. Life will forcibly unravel you and make you clear (since the world is you and it tends toward harmony).

Second, yes but... can I make it happen? Then there are two options: Accelerate the process by deliberately searching out and working through aspects of yourself, analytically or experientially. Or quicker: Just drop straight to the non-resistance level, including letting go of more structured beliefs, and deal with the massive shift. The middle ground is intended shifts with the "collateral damage" of partial reharmonisation. (Or perhaps you could just intend to Be God Now, thanks.)

Which you choose depends on what you're aiming for and what results you want in the interim. Are you looking for harmony, a nice car, total annihilation and rebirth, or what - for instance.

a cover for not having the perseverance to really push through whatever it is...

But is the "pushing through" not just a bit of theatre? Something we just play at, which actually has nothing to do with seeing how things are or changing ourselves. You do all this stuff on the stage, getting your performance just right, so that you eventually allow yourself to exit stage right and go out into the street.

the narrative by-products of the system one chooses to live by.

That's very interesting. Is it that the basic truth is fashioned into a narrative, which implies a worldview which then impacts the behaviour of followers and therefore the world?

In other words, the end-point might be the same for all (originally) but the extra "prove you're worth it" path each organised religion sets its followers (rather than just saying let go and have faith) actually mutates the teachings and causes collateral damage. There's somethng in that (if I've followed you correctly).

if I'm a zen superhero and I can accept everything in my life with equanimity, what about the people around me and how it affects their lives? what about my kid who was depending on me to get food on the table?

Well, the position isn't so extreme. What you describe there is a "selfish solipsism", but most teach a compassionate stance. After all, you have worldly responsibilities ("chop wood, carry water") and Shiva looks out the eyes of all. It's not nihilism. Tibetan Dream Yoga, for instance, is very specific that - yeah, it's all a dream, but you still have dream bills and dream gravity, and the dream bankruptcy or dream impact won't be any more pleasant for them being part of a dream!

Rambling's good.

And, just as a final aside, I don't mean any of this as an attack against you or what you're saying...

Of course not! And obviously I'm pushing things to the edge a bit to open out our discussion, and enjoying your responses and challenges. Will reply properly tomorrow.

right - just better to throw that little caveat out there. this is the internet after all.

I agree. Those pesky t'nets! How something is read can depend on the mood - better to state explicitly where one's coming from if it might not be clear! But yeah, ideas and discussions like this are either fun or useful or interesting or less so. What they aren't, though, is personal.

...

Philip K Dick definitely felt the shifting, transparent nature of the present moment experience - but I think he did not cope with it very well, struggling to make sense of it. Flow My Tears the Policeman Said, Ubik, Eye in the Sky and The Man in the High Castle are all on my top list of novels which generate the "feeling" of this. You can detect him trying to make sense of his experiences within those books.

Good call on Waking Life. I think it's very smart in lots of ways and I think Richard Linklater is somewhat in-the-know (he also directed A Scanner Darkly, after all).

That part where Linkater himself tells the story of Philip K Dick's Flow My Tears synchronistic experience shows you what it's about. We all say "yes" in the end. (Transcript of that part is available here [Dead link] for other readers.)

I also love The Holy Moment chapter.

EDIT: There's also his How To Build A Universe essay [http://downlode.org/Etext/how_to_build.html]. Meanwhile, I thought I'd read Divine Invasions, but looking it up I'm not so sure!

How many countless people have been shown some sense of a way (and perhaps gained a willingness to take the first few steps as a result) becuase of Dick's burning to know the truth!

This is true of me, definitely. Just even to be led to suspect that there is "something else to all this" is a major step. The likes of Philip K Dick (and non-fictionaly people like Robert Anton Wilson) enabled the everyday reader to be opened up to these possibilities.

Agree with you about Linklater's PKD connection. I also think what his works communicate is probably a small fragment of whatever esoteric knowledge he possesses.

His film work drips with it, there is a lot going on there, especially relating to time and connection. If you haven't seen it, you might enjoy the short film On Cinema and Time at the BFI website. (Just re-watched and it actually includes the pinball scene and the holy moment scenes, coincidentally.)

I'd forgotten all about the rooftop guy who dissolves! You should check out this interview below; there's lot of interesting Waking Life stuff in it:

DAVIS: Tell me about the character who seems like an alien, the kid who speaks in a very detached monotone about human life?
LINKLATER: That scene has a funny lineage. My animation partners on this, Bob Savison and Tommy Palotta, had done a short film called Snack and Drink that I think's going to be on the DVD. And it's about that guy. His name is Ryan, and he was a 13-year-old autistic kid who they knew. They just shot some video of him walking up to a convenience store and getting a snack and a drink and talking about cartoons and music. He's kind of regurgitating a litany of things -- you know how autism works in the mind. So they were like, "Hey, you've got to get Ryan in here somewhere." I did have room for a teenager, but then I thought of another idea. I always had this idea as a kid, that you're in a science fiction sort of world and that you would encounter an alien who had been here a thousand years. He had kind of used Earth up and was departing, and you encounter him at that moment, on his last day.
-- Waking Dream, Technosis interview with Richard Linklater

I do think that Linklater has experimented a bit more than he necessarily lets on - other interviews suggest so anyway. I also think Matthew McConaughey might have asked him for some tips relatively recently. :-)

...

It's The McConaissance!

For years, McConaughey embodied complacency; he was an actor who bought too heavily into his own allure and therefore stalled out early on. The fact that he has been able to unravel that perception in a few roles shows how wrong we were.
-- The McConaissance, The New Yorker

It triggered for me when I saw The Lincoln Lawyer. I thought: something's changed here; something's going on. True Will leads to True Detective?

Meanwhile, it turns out I do have the ebook of Divine Invasions on my desktop machine but I've never actually read it! So that's something for me to look forward to. Thanks for the nudge.

Me too!

...

I'm sitting happily tethered to this projection of my life but I am aware of this concept because it is the polarized side of how I cast spells. I take parts from these other realities and bend them to my own will to shape my current one.

When I was first being initiated I used a moment of improbability and "jumped" my life track to this one but I have no idea how and can not do it again. After reading this I don't think I I'll try :3

Well, you have to give up everything if you want everything; relinquish all control to gain the ultimate control. Resistance is useless!

...

...have you ever read the term "tesseract" used to describe journey work?

I was familiar with it as a mathematical shape - a 4-dimensional hypercube - and as a way of representing time diagrammatically (and in crap films!) before I came across this, but hadn't seen it used as a concept in other esoteric practices. But I think the overall approach is intimately linked with practices involving inner and outer.

Could changes be a subtle as a plant growing where it was not growing previously?

Exactly this. Let's explore!

The World is You

What if we look at the world as your extended self; in its entirety it is your true self. If you change one part of the world, there will be corresponding adjustments elsewhere, in two senses:

- 1. The sense of it being a continuous material.** If you tug on one section of a blanket of material, other parts of it will get changed also. If you create a new fold in one area, other folds will be changed: they will be pulled to a new location, may combine with other folds, or even collapse completely into the flat background. Self-balancing.
- 2.The sense that all of the world is meaning, is an aspect of you.** When when you change the form of yourself, the world will correspond to that (because it is that). For instance, having a clear sense of self you may notice that the skies literally have less clouds in them. When you have a clear idea of what you want in life, you might that the winding path into the village literally has less stones or pot-holes than it used to; it might even now be a straighter path. Self-presentation.

The essence of Multidimensional Magick is also that of changing the enfolded aspects of the "inner self" because the "outer world" is just an unfolded image of that. The limits of what can happen depend on the balance of intention and of letting go - "decisions and permissions".

But how?

Inner and Outer

This sounds a bit vague initially, because we are left with wondering what/where that "inner self" is. Actually, it's right here right now.

- The "outer world" is the present moment's sights, sounds, textures, thoughts - which all arise in one mind-space. These experiences are transparent, mirages, and cannot actually be changed directly.
- The "inner world" is the subtle background felt-sense you have. Everything is enfolded into that. This is what you change with magick.

The thoughts that arise to you and the objects you encounter are both just experiences and both come from the same place, unfolding from this felt-sense. So to change yourself is to change the world, and vice versa.

Attempt at illustrating that and the feedback-loop nature of experience in this diagram. The unfolded is experienced as sensory objects; the enfolded is experienced as the felt-sesne.

The Underlying Process

So really, I think all magickal processes involve releasing our hold on the mirage of the moment to better connect with the felt-sense. It is always there, just as the stars are in the sky even at noon, they are just obscured by the brightness of the sun.

At that point, any intention will shift the enfolded structure, subject to your beliefs and identifications. Basically, we "insert new facts" into the universe at the lowest level. The more you let go of holding onto any particular pattern the more the felt-sense, and therefore the world, can shift. Most people have quite a tight hold of their personal self and of certain basic rules of reality - not to mention that many basic rules have now become quite deeply entrenched as "habits of the world" - which limits what might happen.

Fundamentally though, there might be no true limit. And even minor changes could lead to instant changes. Perhaps this explains the stories in /r/Glitch_in_the_Matrix, for instance. (The ones that aren't just dreams and forgetfulness, that is.)

Meanwhile...

...the 3d projection of a tesseract from the wiki...

I try not to look at it. It's so hypnotic. One can so easily get lost in time and space... :-)

TL;DR: All magick is changing your self-world. Any changes to your self changes the world; any change you see in the world is a change in your self. This includes plants growing in unusual locations.

I really enjoyed the blanket analogy. I think I like it so much because there is a homey facility with fitting sympathetic magic into it. Even if it is one person's blanket, the shifting could make someone else have cold feet.

Thanks for the thoughtfulness of your reply!

Haha, I really liked your comment - thanks :-)

...

Yes, it's quite similar overall. In effect, it's another conceptualisation of possibility. In truth, it's just a scheme by which we might allow ourselves to intend over all time-and-space, across the entire enfolded world. There are no actual dimensions and realities and many-worlds or whatever. Rather, there are inter-subjective minds. And the intersubjectivity is not a limited sort; it doesn't restrict possibiilites.

This happens to me randomly. People to whom I've spoken about it think I'm crazy and self-centered and a solipsist. I should figure out how to control it better, because to me it's currently just a curiosity and/or an annoyance (e.g. picture burning something because you turned on the wrong burner and ruining a nice dinner).

It's actually not solipsistic (something I'll pick up on in a later reply) but I think that in general for a stable world you need a stable posture, as it were. By which I mean that we are not fluctuating between detached relaxation and narrowed attention, mixing releasing and pushing.

Ctrl-Z Magick

People occasionally report "reset" events that occur when they are in danger (example [A Hiccup In Time], example [Discovered this sub and have two things I can't understand]) - such as time jumping back to before a crash, or an injury being reversed. These jumps seem to be spontaneous, and not willed.

Has anyone experimented or had experience with this "Ctrl-Z" undoing of events intentionally?

...

Ah yes, I remember reading about that. Thanks! Pretty fascinating. It brought to mind Rupert Sheldrake's thoughts about morphogenic fields - rats learning a maze help the skills of subsequent, unrelated rats. My thinking then was: If the universe is basically timeless, then - like our student friends - perhaps it needn't matter when the rats are trained; the fact of maze training would help all rats to some extent. In other words, just as the later rats benefit from the first rats knowledge, so the first rats might have been benefiting from the second rats' skills. (This would need to be tested for specifically, and I'm not even sure that the nature of such an effect would even be available for testing.)

However, that's not quite the same as being able to "take time back" [<https://tvtropes.org/pmwiki/pmwiki.php/Series/SapphireAndSteel>] when one encounters a situation they don't like. It does demonstrate that time itself isn't a sequential set of isolated moments that can only unfold in one direction though. If we can take time back, then: how? And: does the whole universe get taken back? Just your locality gets warped? Is it a case of personal realities?

It's worth considering that the original event that gets undone might be an extremely realistic, full-spectrum premonition.

That's an interesting possibility: An intense premonition that leads you to automatically take action to avoid it while in a state of 'imagery'. It's hard to separate the two possibilities though, obviously. Quite a few reports (e.g. suddenly being a mile away from where you experienced the crash, and there being two people in the car who experience the jump, etc) don't fit that idea, which makes me think there's 'something' more to it than that. Since magick (invoking our friend Fotamecus, for instance) is known to allow us to stretch or compress time, there could be some mix of time manipulation and premonition happening. But then, at what point does that get so complicated that a "magickal reset" becomes the simpler explanation?

Another explanation is just a shared 'drop out' into a dream, so that a stretch of the experience just didn't happen at all anyway.

The reason for asking the OP question was that, since it's hard to tell the difference between the above explanations when they're not deliberate, perhaps stories of intentional resets by people who are already knowledgeable about the occult/magick could be insightful.

I "reset" losing my watch one time. I still can't explain how it happened. I was at camp, at the pool, and took it off so it doesn't get wet. When we were already on the bus to go back to camp I realized I had left it there. My first thought, this was really weird, was "No! I didn't lose my watch! That didn't happen!" Completely denying that it happened, then I noticed my watch right there on the bus seat next to me.

Thanks for that, interesting. Various "stories" of types:

- Falling on a hill badly and "willing" it undone. Ankle still broken, but bones perfectly aligned for setting.
- "Willing" a reported fatal car crash undone. Going to the site, seeing an obviously bad tyre mark pattern.
- Lots of recovered objects, lost elsewhere but discovered at home or in unusual situations after "deciding" they aren't lost.

Individual stories to be taken with a pinch of salt, but all seem to have the common theme of "asserting" a positive alternative to the situation, or "asserting" the complete absence of the situation (but not focusing on the unfortunate situation and then trying to mentally changing it).

I don't think I ever encountered anyone claiming that experience before the 2000s, but that's entirely my personal experience, and not something I'm holding up as historical canon.

Me neither, but the nature of the experience to me seems like it would be less "special" - e.g. UFOs and spirits and so on - and more just bewildering and confusing. I can imagine not really talking about it except to a friend or two, who probably wouldn't be very interested in talking further. Because it's rare, there's not really been a community for these people - until the Internet became generally accessible and various websites meant they'd hear other, similar stories. Circa the start of the 2000s, funnily enough.

I think it's all storytelling, myself, and not even a misattributed experience resulting from a stressful incident. But I could be wrong.

In general with 'odd stuff', I'd agree - but these stories tend not to be very showy or looking for attention, compared to some of the others. I tend to think the experience is genuine; what the nature of that experience is, I don't know.

The suggestion of an intense premonition/mini-dream is a possibility. Like a minor, accidental DMT hit. Or simply the adrenaline hit of a near-miss messing with the memory. (Because of course, these incidents are reported from memory, so it's their memories they are reporting not the incident.)

PKD - Punched Paper Memory World

One of my favourite Philip K Dick short stories is The Electric Ant. Give it a read first...

SPOILERS

Anyway, it makes me think: Although we don't have a punched paper roll inside us, we do have an equivalent - the memory-surface of our minds. Any experiences we have leave traces, which are then activated by subsequent experiences. We don't really see the room around us directly, we get a couple of glances, and the visual and feeling memory of the room are activated. We experience our memories, rendered as senses in a "perceptual-experiential mind-space".

So, if we were able to edit our memories - like the electric ant amending his punched paper - would we be changing our apparent reality, in a direct experiential way, not just altering what we'd recall when thinking-about something?

When in magick we "declare something to be true" by assertion, act or ritual, is this what we are really doing?

And to what extent did our world of experience have an external starting point anyway; perhaps it began with random noise which slowly formed stable patterns via feedback. In that case, reality is only memory - albeit maybe not personal memory - and so is completely flexible...

What happens when the universe forgets something?

See also this preview book [http://youaredreaming.org/assets/pdf/YouAreDreaming_04252013.pdf] which describes quite well the dream-like nature of waking reality - as a mind theatre inspired by, but not dictated by, the "senses". Or noise and memories?

...

Our punched paper is comprised of DNA

I don't think that's true. DNA may operate as a reactive surface for biological development, but it doesn't govern your experience of reality. For instance, you learned to ride a bike - is that in your DNA now? You learned how to recognise particular objects as you went along, is that?

The "punched paper" you have now is, perhaps, patterns you've accumulated in your brain. Although I think it's better to use the word "mind" since it has less baggage (and we experience our minds; we don't experience our brains).

Misc Communities Misc Posts

Magick: Just how things work anyway? (r/magick)

So, obviously there are many traditions and approaches to magick, ending up with the Chaos approach of 'freeform belief', which itself now seems to have fallen out of favour somewhat. Most traditions portray their magick as being challenging, needing many years to understand and master, symbolism and underlying structures, and so on. Even Chaos magick had an implied model-of-reality to it, which you were cleverly cheating. Alternatively, authors such as Alan Chapman in his book Advanced Magick for Beginners come to the conclusion that magick is essentially just about intention: any act can be a magickal act, if you assign a meaning to it. An act is then just an 'experienceable thing' to represent your intention to yourself, since you cannot directly experience intention (the 'doing' of magick). Even the act might not be required!

TL/DR: Given the easy access we have to all relevant information these days, do mages in general still hold to a particular approach and believe in it, or are we all becoming stripped-down utilitarian relativists?

- Do you have a favoured tradition that you really believe in?
- Has your approach become simpler, or has it become deeper, over time?
- How has this informed your view of what magick 'really is'?

Imaginary Friends & Created Characters ([Aeon.co](#))(r/Tulpas)

An Aeon magazine article on "imaginary friends" in childhood which then broadens out into the independence of fictional characters in creative writing. It doesn't mention tulpas explicitly, but some of the content brushes very close and might be interesting. Excerpts:

[QUOTE]

I remembered that a former colleague had once told me about his son, Joe, who’d introduced a cast of invisible characters to their family. One Friday afternoon, Joe and I spoke on the phone:

Joe: I sort of think that Sweek [the planet where his imaginary friends live, basically a "wonderland"?] is actually my room, because I can’t go in a spaceship and go to Sweek, 1) because I don’t have one and 2) because Sweek isn’t real, it’s just my imagination.

...

[On an author's inventions seeming to come to life:] The study’s authors call the phenomena ‘the illusion of independent agency’, which ‘occurs when a fictional character is experienced by the person who created it as having independent thoughts, words, and/or actions’. An author invents a character on the page, and before long feels like that character has a life of its own, and that the author is simply there to record its independent decisions and movements.

Not long ago, I interviewed the author Hilary Mantel and she explained her writing process as being similar to that of a medium, like the character of Alison in her novel, Beyond Black (2005). This is how Mantel describes Alison at work: ‘She starts a peculiar form of listening. It is a silent sensory ascent; it is like listening from a stepladder, poised on the top rung; she listens at the ends of her nerves, at the limit of her capacities ... The skill is in isolating the voices, picking out one and letting the others recede... -- Two Lands in my Mind, Aeon Magazine

Heaven Sent (r/askheaven)

Where exactly is heaven located? I don't mean sky/underground, but in terms of accessing it right now. Do you conceive of it as been sort of "in the background everywhere" and you tune into it?

What is the relationship between heaven and other worlds - is it in a privileged position, or is it just basically a more flexible, dream-state type environment?

...

[COMMENT BY DreamingOrAwake]

Those are good questions..

Where is heaven exactly?

In position it is not above, nor below, it is more like an extra dimension. The physical world can be expressed in coordinates x,y,z,time. Every living being is living in a physical body or at least connected with it. If you are a bit sensitive, you can feel an aura around every living creature. This is what I call the spirit-body. The spirit-body surrounds the physical body as if it has one more dimension. So it is surrounding the x,y,z of our physical body.

And very sensitive people or animals can sense something just before it happens. So the spirit-body is surrounding the time-coordinate of the physical body. Our source (or soul-light) is even on a higher dimension than our spirit. It is connected with heaven already. There are different connections that we have with our source (soul-light).

Different people have developed different techniques for it. Religions reflect these differences:

- Christians like to name their heart-connection, the place of the soul.
- Zen-Buddhists often name the mind, a connection in the center of the head. Other Buddhists use the connection in the heart, or the connection on top of their head.
- Hindustan have a connection for each chakra. Each chakra is connected to a different group of gods.
- I believe Maya-people felt connected with the stars.
- Australian aboriginals feel connected with the earth and nature.

But I believe that all are a connection with our source. It is not a privileged position, because everyone can feel at least one connection. The strength and how much we can live from these connections is different per person. A lot of small children have a good connection, and can show wonderful things. Sadly many people ignore their connection or get their connection polluted in some way. They like to reconnect, but for them the illusions in the world have become much more important. For me: I can connect to heaven at any point in time, even under stress. I have not seen many people capable of doing this. It feels I am also more connected with my inner child.

Tuning in

One way of tuning in to your source in heaven, is by connecting with your inner child. First ground (connect with a tree or a mountain), and then go backwards in time. Go back to when you were a baby. Go back to before you were born.

These stages give different feelings. But somehow you automatically connect to your source. With exercise and repetition you can heal and strengthen that connection. When I am connected, I am still aware of my body and the world around me. And I am still grounded. It may not be so easy for other people, but I think anyone can learn it.

Other worlds

If your connection is not clean, you can easily get in the many dreams (and astral worlds) that are around our physical dimension. These are not bad, but can keep us away from reconnecting fully. Sometimes these dream stages can help us. Some dreams can be wonderful and full energy. Some dreams can take us away from our grounding. Some dreams can show us what is stopping us from going further. I usually ignore all these dream states, and focus on my body and grounding instead. I invite the energy of heaven to come to me instead.

Portals

If I find some spirit that has problems, I often help this spirit to go to the light (=heaven). I do so using a similar meditation technique, but stay much more focused on my surroundings. I can often sense such spirits with my hands or aura. I ask the helpers from heaven (whatever you want to call them), to create a portal to heaven for this spirit. Different spirits often need different portals. Using my grounding, aura, and environment, the helpers can create this temporary portal. I guide the spirit to the portal ("you can go there"). And it slowly dissolves from our physical dimension, and moves to a different dimension. Usually this new dimension is a heaven like dream. It is a small dream-world created in the heaven-dimensions for this spirit where the spirit can go to. After the spirit has adapted and healed, the dream slowly dissolves. Usually they grow into a different form of themselves that is fully connected to their source.

Other worlds

So the relationship between heaven and other worlds, is that heaven is more like a higher dimension of the other worlds. It is where we are connected to our source. In all other worlds we are not fully connected. In some sense our physical world is seen as a dream-world from the heaven-dimension. The physical world is a combination of frozen dreams. According to my guides (helpers) there are more parallel physical worlds. And while we may learn in these physical worlds, all guides want to help our worlds to get unfrozen, and everyone reconnected to heaven. They don't tell me how this will be done, but help me with my personal life in the physical world instead. ;-)

[END OF COMMENT]

Much to ponder - thanks!

According to my guides (helpers) there are more parallel physical worlds.

Tell me more about guides/helpers, their purpose, nature and actions!

There is a lot to tell about it. I'll make some posts about it.

Great, looking forward.

The Feeling (r/energy_work)

I've just been reading the Daniel Barber book (listed on the sidebar) and was struck by the similarities between this...

[QUOTE]

By consciously creating a strong somatic effect (gut feeling) within ourselves which mirrors the gut feeling we would have if our desired intentions, expectations and feelings were already extant, we have a method for managing, or even manipulating, our reality. This somatic effect is our interface into The Quantum. This is how we pass commands, for good or ill, to the universe.
-- Daniel Barber, The Visceral Experience, p11

[END OF QUOTE]

...and the work of Neville Goddard ("summon the feeling of the wish fulfilled" from Feeling is the Secret and The Power of Awareness) and my own approaches for breaking down boundaries and creating a more unified experience (see latest post here, again all about stretching out and asserting a 'feeling'). Meanwhile, synchronistically I was rewatching Christopher Nolan's Inception last night and noticed the line:

[QUOTE]

Ariadne: I guess I thought the dream space would be all about the visual but, it's more about the feel of it.
-- Inception (Christopher Nolan, 2010)

[END OF QUOTE]

I'm personally coming to the idea that things like modal visualisation (image, auditory, touch) are really only effective insofar as they generate, perhaps just as a byproduct, this felt sense or direct experiencing/knowing of a situation being true (or how it would feel if it were true). Which implies this felt-sense is the background reality, from which appearances arise?

Do you any of you guys focus more on the direct feeling like this? Or do you tend to focus more on a particular route - picturing or sensing energy, and maybe use a feeling to tell if you're "there" yet?

...

And the way you described that really put another spin on it, thanks, because it's true that there is the 'general world felt-sense' (or signature) and object-level or situation-level 'signatures'. And the results can be quite rapid.

Maybe not that exact object or even, but one with the same spirit, it's really fascinating

That's great. It can also account for the fact that we encounter the same situations, relationships and even "actual people" again and again. In every workplace I've been in, for instance, I've had an identical mentor-type-person looking out for me (not officially, but effectively), and in any social group, similar recurrences. The same people, in different attire. It's fascinating. Fall into a general depression, a global 'felt-sense' of doom? Your apparent world will start to crumble within days. Everything will line up accordingly. Summon the feeling of achievement and stability and good luck? It switches around. I think the phrase "count your blessings" is a nice way to encapsulate that you must retain within you, your felt-sense, the 'signatures' of the aspects of life you like. Otherwise they'll gradually dissolve. Worse, if you switch track, they'll drop out more dramatically. This applies even to the body. Perhaps much body degradation is due to people's gradual withdrawal over time into their head area. Their bodies become less 'coherent' and defined; you let go of the 'feel' of yourself. I think this can be recovered to some extent though. (Can't remember the name, but there was an interesting book about a guy who created "bed exercises" for himself to bring himself back to good condition; really what he was doing - if it was true - is expanding his 'presence' again and intending a signature of health.)

all see[m/k] to remove our presence from our bodies

Yes. And it is about maintaining expanded presence of your body-area and the world around you, rather than simply "staying in the present moment", which doesn't capture it properly. Everything is to be included. It's not a holding-on, it's a aware being-with.

Part of my training is to keep my mind, spirit, energy and breath in the entirety of my body at all times. It's exhilarating and extremely healthy.

Just the ticket! :-)

Is it energy or is it realised metaphor? (r/energy_work)

When we use "energy" to accomplish something, are we really summoning and using such a thing - or are we in fact generating an experience as a prelude to our target desired experience?

In other words, does energy become an intermediary "permission slip" experience that allows us to generate our intention, even though we could make the change directly with the appropriate belief and intention?

EDIT: I should say "produce the intended result" rather than "generate our intention".

...

Energy is no more a "permission slip" for change than gasoline is a permission slip to drive

Very good :-)

My rephrased version might be: is energy our sensing of "pure potentiality". The reason I find this difficult, is that I don't see how it is moved and transferred. If I "use energy" to turn a wheel does that correspond to a physical thing that transmits and moves, or am I basically saying that I have this ability to change anything and I am "releasing the filters" to allow my change to take place.

I would like to recommend a book to you; "Akido, Aikibojitsu and the Structure of Natural Law" by John Read. I would like to explain but I am just not eloquent enough to convey it, although John Read is. His book explains this perfectly.

Thanks - will check that out! :-)

give ourselves "permission" do things which make it happen. Did I understand you correctly?

Yes. I guess I'm trying to reconcile energy work with "magick", in particular where in the latter the act itself can be irrelevant and what matters is the meaning behind the act. So if I visualise energy - even summon the experience of feeling - travelling from me to an object, how does that differ from me reaching out with my mind and simply intending. My thinking was: is that extra "sensory theatre" (excuse pun) when really it is the connection and intention that does the work, with energy being your "excuse" to allow the result to happen, making it "plausibly justified".

So the issue is not whether or not the energy is behind the effect, but whether that energy is simply the intent and we are just attempting to process it by visualizing it.

It's probably a mixture of the two - but by "intention" I mean something more than simply wanting, more akin to what you are calling energy, so this is making sense. My "intention" basically is "directed energy". Language, eh :-)

The "sensory theater" of visualizing things is a method of using your mind to channel it, although you're right, it's not truly necessary for the effect. The energy itself is though.

This makes sense to me now. Okay, I'm suggesting that the extra theatre is so you can "experience yourself doing something"... but really you can just do the directed energy and what you experience then is the result (possibly a sense of resistance or push-back, but then the desired outcome hopefully).

Point is though that, even though it theoretically should work without the visualization, this proves that, at least for me, it is definitely quicker and easier with.

Ah, interesting. Now the extra bit would be, if you have a stronger belief that it would work with visualisation or - more what I mean - that this has become an "established route" for you, in a way that "willing" doesn't. I'm getting inclined to think that there's an element of mentally "occupying the space" of the target, whether that's the external thing (nosebleed) or a body feeling (sense of truth of other facts), before change happens. Just as if I really strongly frown and say "arm: move!" it probably won't happen, but if I mentally occupy the space where my arm is, then simply "asking-imagining-feeling" the outcome brings the result.

I think I can explain this in a way that makes sense. Reality comes from within outwards, not from outward in.

Ah, nicely written. So, would we say that magick is basically "requesting" and having results occur by apparently external available routes/mechanisms (a version of prayer), whereas energy work is grabbing reality and manipulating it directly?

:-) I think that is quite a good division.

One that possibly falls between: Neville Goddard's approach involved "summoning the feeling of the wish fulfilled", basically intensely feeling what the outcome would feel like. I guess that is a transformation of the inner, pushing it to the outer. It does muddy the inner/outer waters a bit though, perhaps.

Mind-Formatting: Synchronicity & Imagination (r/lawofattraction)

I've been having a couple of discussions elsewhere which might be relevant to this subreddit. I am always on the lookout for better metaphors to describe how the mind, perception, reality, intention work - e.g. the Infinite Grid metaphor for describing a shift from one experience to another. More recently, following a post about synchronicity:

- Synchronicity as a result of mind-formatting, followed by:
- The metaphor of The Imagination Room

You can probably see how these fit into the LOA scheme. Do you have a particular "way of thinking about things" that helps you understand and use this approach? How has it affected your success?

...

I'm majoring in metaphysics

Ah, nice. Actually, you might find Bernardo Kastrup's website and the related Metaphysical Speculations forum of interest. It's a little focused towards straight philosophical idealism perhaps, but sometimes interesting things come up.

I love the imagination room analogy

Great. It's quite good fun, isn't it?

I'm on a bit of a quest for what you might call "practical metaphysics" for describing personal experience, different metaphors that you can live from. It's easy to get into thinking-about things, without actually really adopting and experiencing them. So with things like The Imagination Room, the idea is that while you go about your day you can bring up that image, and kind of "feel it" in place and experiment.

Right, applicable metaphysics. Things people can use to improve their lives.

Yes. People can spend a lot of time trying to be "right" and think that will improve things. Actually, they are just being conceptually right - building self-consistent thought-castles in the sky. They end up feeling correct, but their lives remain the same. A decent metaphysics for living would actively shape lives into a happier form; you would absorb and become it. As Slartibartfast says on the old Hitchhiker's Guide to the Galaxy TV series (I assume it's in the more recent film too):

[QUOTE]

- SLARTIBARTFAST: I'd far rather be happy than right any day.
- ARTHUR: And are you?
- SLARTIBARTFAST: No. That's where it all falls down of course.

[END OF QUOTE]

Well, in an applicable metaphysics you'll get both!

Indeed. I personally consider the LoA to be both the truth to a lot of questions about existence, as well as the most applicable, hence why I threw myself into it so completely.

Agreed. The only problem with it is, because it's formulated as a list of instructions without a supporting structure, people get confused. They try to make changes in their world while still remaining, themselves, as they were. But - as the room metaphor points out - it's a matter of shifting or imagining the whole experience, which includes the person-experience. Neville Goddard from the New Thought era (The Law and the Promise, Out of this World, etc) was quite good on this, although his language is a little obscure sometimes for modern tastes. He had both the idea of world-as-imagination, and all-possibiliites-already-exist, but he never really wrote up a single description for it.

Right. People hear about this and the testimonials to its legitimacy, and accept and attempt to apply it. They don't realize that they will never see real results unless they put forth the effort to learn WHY it works, and the truth behind human nature. Without that understanding of the background processes, one can never truly use the LoA to full effect

My feeling is that people genuinely don't understand the difference between thinking about something, and imagining it from their own perspective. They do the equivalent of creating a little thought bubble containing their wish, looking at it, rather than summoning the experience around them. No amount of explanation seems to work. That's why I've come to think that spatial visual metaphors are the best way. For an example of how hard it is to bring people back to their present, spatial experience, I recommend checking out this conversation between Rick Archer and Rupert Spira [POST: Rick Archer interviews Rupert Spira]. You've got one guy (Archer) who is supposedly interesting in understanding how things are, another guy (Spira) who is leading him to it, and the first guy is constantly wanting to talk about it rather than have the experience. Maybe this is because: Most people are slightly dissociated, and coming back to being 1st-person and "embodied" is actually an unpleasant idea? So they wriggle and resist it. LOA and its ilk all involve confronting and being yourself fully.

Precisely, without the understanding behind it, and even sometimes with it if they don't take it to heart, people make their wishes and desires, but don't complete step 3, allowing. By not imagining it, like you said, they still offer resistance, most likely by doubting it will come, etc

"Absolute allowing" - with that, if one could truly commit to it, everything would be far easier.

I cultivate a view that I live in a kind and loving universe. By accepting that, I accept that deserved or not, good things will happen for me. It allows a lacksidasical certainty of outcome.

Nice style. The whole notion of "deserving" is an error anyway; unless you imagine that the universe operates on that principle. A true "law" works regardless of whether you've been a good boy or girl or not. The "gratitude" aspect to LOA is, in my opinion, a matter of associative triggering - in much the same way as part of a memory results in auto-completion of the recall (e.g. a smell or texture triggers a memory of a childhood event), feeling good results in filtering down to, and mechanical selection of, feeling-good-type events.

Associative triggering: same as smiling to make yourself happy. I think you are quite right, by being grateful, you are implying / accepting the outcome.

That's a nice example. LOA: The Amoral Santa Claus.

Time Travel, Personal Universes, Extended Persons (r/timetravel)

So, there are various theories and rebuttals for/against time travel. Wouldn't we have met time travellers already? The consistency principle prevents changes, surely? Various paradoxes? Multiple universes? Are there timelines? and so on. However, perhaps all of these can perhaps be tackled using the following principles, by short-circuiting the notion of a time-line and a persistent, consistent experience:

- Time travel is actually the creation of a discontinuity in your personal experience, such that it changes to resemble a different time. There is no 'travel into the past' as such - rather, you jump to a different 'dream'. This is the sense in which you branch to another universe. And that is also the sense in which time passes normally.
- The 'you' that jumps isn't physical. Rather, your everyday experience is like consciousness or awareness 'looking though a viewport' at the world - or similar to experiencing being a character in a dream. Hence, your body doesn't need to be transported, it is part of the 'world experience'.
- People are 'extended beings' in the sense that they are not simply located in a given universe/instance, they are 'extended' over all possibilities. So, your mother in one universe is your mother in another universe, but a different aspect of her being.
- It is possible that not all characters in your experience have a 'consciousness' looking through their viewport/perspective. You are not able to tell the difference. (Alternatively, all characters - including your viewpoint character - and all branches - are part-fragments of your overall experience.)

Time travel is this view is therefore an extreme version of changing the present moment, and does not involve 'time' as commonly thought. Therefore all changes are possible, and all experiences; all criticisms are valid in one present experience/viewport or another, just not in the one you are at. It also means that memories occur in the present, and so changing the past from here simply involves a discontinuity in the present moment experience, plus memories which remain consistent with this when summoned. So, can we short-circuit the problems of time travel by reframing our position in it and moving away from the notion of a 'timeline'?

Dimensional Jest (r/timetravel)

[META] Realityshifters and the Mandela Effect (r/MandelaEffect)

Cynthia Sue Larson's [Realityshifters.com](#) website was one of the first to tackle the subject of "reality shifts" online and has been collecting personal accounts since 1999, including encounters with what we would now call "Mandela Effect" experiences. Her latest extended blog post focuses specifically on the effect, on its breakout as a mainstream topic and her own view on its interpretation (invoking the concept of a superposition of states). Regardless of whether you agree with her take or not, it's a well-written piece and worth a read as a thought-provoker. Excerpts from the introduction:

[QUOTE]

The phrase “Mandela Effect” has been trending upward at an exponential rate between July 2015 and July 2016, as seen when viewing a graph produced by Google Trends. While many are surprised by the recent surge of interest in the “Mandela Effect,” those of us who have been researching and writing about this phenomenon of reality shifts and alternate histories have long been anticipating just such a rise of interest. The Mandela Effect is one of those things most people won’t believe in until it happens to them.

Like falling in love or going through heartbreak, the Mandela Effect is something you have to experience in order to fully embrace. And even then, it often takes more than one or two experiences to break through the resistance most of us have to accepting the existence of something that fundamentally challenges our unspoken foundational assumption that facts and historical events don’t change.

[END OF QUOTE]

The entire article can be read here: Amazing Rise of the Mandela Effect [<https://cynthiasuelarson.wordpress.com/2016/08/07/rise-of-the-mandela-effect/>].

"On shared false memories: what lies behind the Mandela effect" - [Aeon.co](#) (r/MandelaEffect)

An essay on the Mandela Effect has been published over at [Aeon.co](#) which might be of interest. It begins:

[QUOTE]

On shared false memories: what lies behind the Mandela effect
[Caitlin Aamodt is a doctoral candidate in neuroscience at the University of California, Los Angeles. Her research interests include behavioural epigenetics, cognitive evolution, and neuropharmacology.]
Would you trust a memory that felt as real as all your other memories, and if other people confirmed that they remembered it too? What if the memory turned out to be false? This scenario was named the ‘Mandela effect’ by the self-described ‘paranormal consultant’ Fiona Broome after she discovered that other people shared her (false) memory of the South African civil rights leader Nelson Mandela dying in prison in the 1980s.

[END OF QUOTE]

[...]

Notes & Observations:

It does rather presume that the default interpretation of the Mandela Effect that people adopt is the "sorta quantum physics" one, but I guess this is because it's very much taking Fiona Broome's musings as its starting point (fair enough). It also perhaps misrepresents the Schrodinger's Cat thought experiment as an explanation of the wave nature of particles leading to "two simultaneous macroscale realities", rather than its origin as illustration of the absurdity of this interpretation. It then later fails to truly justify isolating a "many-worlds" concept as derived from quantum physics from a philosophical version of it applied to subjective experience. ("Many-worlds" is really a philosophical notion anyway, surely: it is not something that can be tested; it's one possible narrative that can be attached to a raw mathematic structure which itself has no particular meaning. This possibly trips up the essay's own conclusion.)

Beyond that, its neuroscience-y account seems to me to be rather hand-waving as an explanation - but it's reasonable in terms of highlighting areas to think about for an audience ignorant of the topic. I do think that the conclusion that "a true scientist must test his or her alternative hypothesis by trying to disprove it", whilst cute, is a somewhat of a missed opportunity to highlight why that approach is actually highly problematic for this particular phenomenon. It's a basic issue we have that descriptions of the Mandela Effect cannot assume the "independent, simply-shared objective world" concept usually employed in scientific studies. But then, this is an essay by a neuroscientist rather than a philosopher (or a physicist, for that matter). It also mentions /u/EpicJourneyMan by name, so it may be of particular interest to him:

The Redditor EpicJourneyMan recounts an extremely detailed account of Shazaam from when he was working in a video store in the 1990s. In his post, he describes buying two copies of the movie and having to watch each several times to verify that it was damaged after renters complained. He then proceeds to describe the movie plot in great detail. Confabulation seems to be more frequent in the face of repeatedly unpacking a memory; in other words, someone like EpicJourneyMan, who regularly ordered children’s videos and watched them to find damaged tape, is more likely to confabulate a specific memory from that material.

Anyway, have a read, and there's a comment section to participate in if you feel so inclined. Meanwhile, Aeon is often a source of interesting viewpoints on a variety of topics, so it's worth checking in now and again, even if this particular essay doesn't hit the spot for you.

...

Q1: Pretty much the same debunking comments that is spread throughout Reddit and online. Again most of the explanations for false or incorrect memories work when taken on a one by one case, but ignores that it a large number of people having the exact same memories, in most cases independently of one another. Confabulation is a real thing and so is creating false memories, but creating the same false memory is something that should be explored further.

Yes, it's very much of that sort, albeit written for a publication under the author's own name and declared expertise in what they assume is a key relevant subject (hence posting it). It's somewhat of another example of starting from a particular platform, and then trying to answer to an abstract, generalised version of what the Mandela Effect experience is - providing an explaining-away, rather than approaching it on its own terms and explore the limits of (and address the inherent problems with) developing an explanation. There's also a tendency to use a slightly fictionalised narrative about how people experience memory in daily life as regards this phenomenon: people do not really "remember" things as such except in a specific subset of circumstances, but instead have "contextual encounters". That is, the more interesting examples aren't about remembering facts as such, they are about ongoing personal encounters which are derived from facts, and its the shift in later encounters that triggers a discontinuous experience.

The previous incarnation of the sidebar tried to capture that:

[QUOTE]

DEFINITION
"The phenomenon where a group of people discover that a global fact - one they feel they know to be true and have specific personal memories for - has apparently changed in the world around them."
Note: Given nature of the effect, 'evidence' inevitably takes the form of shared personal memories; physical evidence of the previously remembered state is unavailable. If such evidence is discovered, that's proof of an alternative explanation.

- Your post should be about your personal encounters with examples of the Mandela Effect.
- Your post should include specific details indicating why you think it's a Mandela Effect.
- Your post should follow from the definition provided in the sidebar.

[END OF QUOTE]

However, it was perhaps a little opaque for the casual reader, and in any case people don't usually read the sidebar, and (a little like the author of our essay) push ahead based on their own first-level assumption about what the Mandela Effect is (and usually conflate the experience with the explanation) without much further consideration to a detailed definition.

Ref. NG for "froms vs influence"? (r/deadchildren)

...

Hello! I was just saving that as a link to add to the Neville Goddard post elsewhere (people are often concerned about "other people" and accidental side-effects, and this lecture nicely summarises the "select a scene" approach vs targeting people's actions).

Your question - It's easiest to interpret "assume" as in "take on the image of" - you are summon the feeling-state of being wealthy. You have a scene which you are using to imagine yourself to be rich (as per Neville's approach). Furthermore, as you go about your day, you persist in that feeling "of the wish fulfilled" - the feeling that goes along with that state. Remember that what is really underneath Neville's approach that the scene around you now is basically thought anyway, just a very bright one. If you imagine something on top of that, overwrite the scene three-dimensionally with all senses, **you are shifting this state to that state**. Simply doing so at all, fully, leads to a movement of state and a result. However, if whenever you see evidence that you are not what you want and you get caught up in that - hence Neville instructions to "persist in the state" of the with fulfilled.

Try it and see eh. To broaden this out a bit: devil's in the details a little. So, literally say to yourself right now: **"One million dollars"**

What happens?

Yeah, my next thing to say was, it matters what the intention is behind the words/act:

- If you say the words "nice house" with the intention that doing so means-that you will have a vivid mental picture of a house, that's what will happen.
- If you say the words with the intention that it means-that you are going to be living in that house, similarly.

Which is why you can use everyday objects to make unconnected changes remotely. There's extra stuff about circumventing "plausibility" and time and all that, but it's not really important. Not having an intention is where people go wrong; like people who go to the gym but don't actually intend that going there means-that they will get fit. Looking forward to the house party!

The Story: Mistaking Narrative for Causal Understanding (r/deadchildren)

...

From the article -

There is no better illustration of the pitfalls of a good story than economics. The shortcomings of this discipline as a predictive or even explanatory science have been well advertised, but one rarely acknowledged reason for those failures is the penchant of analysts to mistake narrative for causal understanding. How often do we see charts of fluctuations in, say, share prices or economic indices decorated with arrows indicating the political or financial events that ‘caused’ them? Even when these are not transparently spurious, with spikes that are evidently mere noise commandeered to serve a story, the narrative is often an empty posture of omniscience. Some economic movements are of course predictable in the broadest terms – no one expects markets to look the same if the Eurozone collapses – but there might be no logical reason to expect some events to have a big effect and not others. Even so major an event as the 2008 crash lacks a consensus ‘explanation’ with anything like the force of the explanation for, say, the explosion of the Space Shuttle Challenger in 1986; we can agree that subprime mortgages played a part, but if we knew exactly how then the effects would have been predictable. [A good example of the need to ask: "how, exactly, does it explain this?"]

This economic storytelling isn’t just the art of charlatans and false prophets. It is endemic to the discipline. The standard theory of market fluctuations attributes them to ‘exogenous’ causes, meaning that they are induced in a potentially stable market by external political events. This makes it permissible to tell a story about what ‘caused’ the market to behave a certain way. The truth, however, is that the real consequences of such disturbances are generally unpredictable because the internal dynamics of the economic system are inscrutable: everything depends on feedbacks that might or might not amplify a particular modest disturbance into a major disruption. History typically works that way too, as does traffic flow, crowd behaviour and many other human social systems. The corollary is that narratives do more to mask true understanding with a superficial veneer of authority than they do to offer a useful explanatory framework.

QBism, the Perimeter of Quantum Bayesianism - Fuchs (r/deadchildren)

...

FIG. 5. **Sarcasm.** In a lecture bottlenecked by repeated accusations of Quantum Bayesianism’s solipsism, the author sometimes uses the following technique to move things along. Referring to the previous Figure 1, he asks the stubborn accuser, “What about this diagram do you not get? It shows an agent and a physical system external to him. It says that a quantum state is a state of belief about what will come about as a consequence of his actions upon the system. The quantum state is not a state of nature, but so what? There is an agent with his belief; there is a system that is not part of him; and there is something that really, eventually comes about—it is called the outcome. No agent, no outcome for sure, but that’s not solipsism: For, no system, no outcome either! A quantum measurement without an external system participating would be like the sound of one hand clapping, a Zen koan. If we were really expressing solipsism, wouldn’t a diagram like the one above be more appropriate? A big eye- ball surveying nothing. Now there’s really no external system and nothing to act upon. That’s solipsism.”

[*The sense in which there is something "external", though, might be better described as something not being "selected into experience", rather than something actually external to the experiencer due to a boundary or relative location - TG*]

A1: "Solipsism" is a trigger word for a lot of people. Once they hear or think that something is solipsistic, their thinking shuts down. It's hard to deal with this in physics, because physics is by design a collaborative process, and very few people know how to reconcile collaboration and solipsism. Most people assume that collaboration necessitates a non-solipsistic worldview, so dealing with this in physics is hard. But dealing with it in private life is easy: just don't talk to people who are triggered by "solipsism."
You know when someone tells you "If you really believe in solipsism, why are you talking to me?" You can just say, "Why would I ever want to cross my arms? Don't you know that the only reason to cross one's arms is to keep the left arm from falling off with your right, and to keep the right arm from falling off by hanging onto it with your left. If both arms are the same body, why cross them????" The absurdity of this position should be obvious.

Too Many Worlds: MWI and You (r/deadchildren)

...

Particularly nice - Most MWI popularizers think they are blowing our minds with this stuff, whereas in fact they are flattering them. They delve into the implications for personhood just far enough to lull us with the seductive uncanniness of the centuries-old Doppelgänger trope, and then flit off again. The result sounds transgressively exciting while familiar enough to be persuasive. You see, for some reason, Tegmark doesn’t trouble his mind about the many, many more almost-Maxes, near-copies with perhaps a gene or two mutated – not to mention the not-much-like Maxes, and so on into a continuum of utterly different beings. Why not? Because you can’t make neat ontological statements about them, or embrace them as brothers. They spoil the story, the rotters. They turn it into a story that doesn’t make sense, that can’t even be told. So they become the mad relatives in the attic. The conceit of ‘multiple selves’ isn’t at all what the MWI, taken at face value, is proposing. On the contrary, it is dismantling the whole notion of selfhood – it is denying any real meaning of ‘you’ at all. Is that really so different from what we keep hearing from neuroscientists and psychologists – that our comforting notions of selfhood are all just an illusion concocted by the brain to allow us to function? I think it is. There is a gulf between a useful but fragile cognitive construct based on measurable sensory phenomena, and a claim to dissolve all personhood and autonomy because it makes the maths neater. In the Borgesian library of Many Worlds, it seems there can be no fact of the matter about what is or isn’t you, and what you did or didn’t do.

Excerpts from 'The Akhenaten Adventure' by PB Kerr (r/deadchildren)

Excerpts from The Akhenaten Adventure by PB Kerr

I was in conversation with a user a while back (username) about all matters oneirosophic and he pointed out some passages from one of his childhood books, which are interesting in that they highlight many concepts which are common ("logical space" and "thinking means possible"), and even portray some of the same attitudes ("how it works but not really"). It's always interesting when fiction describes an underlying reality in detail, especially when it's done a way which seems a more "philosophical" than would seem to be appropriate for its audience. A case of trying to pass on a bit of knowledge into the imaginations of the young before the monotony of everyday life beats it out of them?

Anyway, I've transcribed the relevant quotes below.

//////////

Excerpt from page 111:

“Get rid of what?”

“The rhino of course.”

“What rhino?”

She looked again and saw that the rhino was gone. The sharp, animal smell that had accompanied the creature was gone, too.

“Magic,” breathed John, who was terribly impressed by Nimrod’s display of power.

“Magic? Good Lord, no, my boy. A djinn doesn’t do magic. That stuff is for kids and simple-minded adults. A djinn works his will. That is the proper way to refer to what we do. We work our will. It is, to put the case slightly differently, mind over matter. That is all.”

Excerpt from pages 166-171:

“Try and create in your own mind the impression that your word must only be used very sparingly, as if it was the red button that might launch a missile, or fire some enormous gun.

“John? You go first. I want you to open your eyes now and visualise the absence of one particular rock. Picture the rock’s disappearance as a situation in logical space. Fix it in your mind, as if the reality couldn’t possibly be any different from what you’re imagining. And then, keeping that same thought, utter your focus word as clearly as you can.”

John collected his thoughts and, remembering how Nimrod exercised his own powers sometimes, brought his feet together, raised his hands in the air at about chest height, like a footballer taking a penalty kick, and then shouted: “ABECEDARIAN!”

For ten or fifteen seconds, nothing happened, and John was about to offer his apologies and “I told you so”s to Nimrod when, incredibly, the six foot high rock he had chosen, vibrated quite visibly and a shard about the size of a walnut fell off.

“Wow,” said John. “Did you see that? Did you?” He laughed, almost hysterically. “I did it. Well, I did something, anyway.”

“Not bad for a first attempt,” said Nimrod. “It didn’t disappear but I think we’ll agree, you certainly made an impression on it. Philippa? Try the bigger one next to John’s effort. Think how your picture of the rock’s absence is attached to reality,” he suggested. “Remember, the rock’s disappearance is a possibility that must have been in the rock from the very beginning.” He paused. “When you’re ready, when you have accepted that logic deals with every possibility and that all possibilities are its facts, then press the red button that is your focus word.”

As she concentrated on the boulder and prepared to utter the word of power she had chosen, Philippa raised one hand like a ballet dancer and then waved the other like a traffic policeman.

“FABULONGOSHOOMARVELISHLYWONDERPIPICAL!”

Even as the last consonant left her lips, the boulder she had chosen began to wobble, and it kept on wobbling, quite violently it seemed to Philippa, for almost a whole minute before it stopped again. She clapped her hands together and squealed with delight.

“Yes,” Nimrod said patiently. “You certainly disturbed its molecular structure. That much was obvious. Only it seems to me you both have to get a clearer idea of nothing in your heads. You’re both confusing the idea of alteration with disappearing. A common philosophical mistake. Altering the appearance of something is very different from it not being there at all.

“Now try again. Remember, whatever is possible in logic is also permitted. A thought contains the possibility of the situation of which it is the thought. So what is thinkable is possible too.”

The twins were surprised at how much concentration was required to focus their djinn powers, so that it quickly seemed like hard work and left them feeling out of breath, as if they had lifted some heavy object, sprinted across a field, and attempted to solve a complicated algebraic equation at the same time. After two hours, all they had succeeded in doing was making a few largish boulders become smaller boulders, at which point Nimrod let them rest for a few mintues.

“This is hard work,” admitted John.

“In the beginning, yes,” said Nimrod. “But it’s like building physical fitness. You have to learn to develop the part of your brain where the powers are focused. Teh part that we djinn call the Neshamah. It’s the source of djinn power. The subtle fire that burns inside you. A little like the flame on an oil lamp.”

Nimrod rubbed his hands. “All right, let’s try making something appear. It’s getting near lunchtime, so how about a picnic? Here, I’ll show you the sort of thing I mean.” And so saying, Nimrod waved his arms and created a very sizeable picnic on the desert ground, complete with tartan rug and a picnic basket containing lots of sandwiches, chicken legs, fruit and thermos flasks of hot soup.

“There we are,” he said. “All you have to do is remember that you cannot create anything contrary to the laws of logic. The truth is that none of us could say what an illogical world would be like. And since that is the case, the very fact that you can think of making something from the energy that is within you is enough to admit the possibility. As soon as you have convinced yourself of the possibility of creating a picnic out of yourselves, the picnic becomes easier to bring into being. Do you see?”

It took a while longer, but gradually, as the twins begin to realise that all objects contain the possibility of all situations, they started to get the hang of djinn power. Finally, after another ninety minutes of head-ringing thought and examination-level concentration, there were three very different, but apparently edible picnics lying on the ground.

Nimrod approached Philippa’s picnic first and picked up a cucumber sandwich. “The proof of the pudding, so to speak,” he said, and tasted the sandwich circumspectly. Almost immediately he spat it out.

“This tastes quite disgusting,” he said, and turned his attention to tasting one of the hot dogs from John’s picnic. “And this doesn’t taste of anything at all.” Nimrod allowed a mouthful of hot dog to fall off his tongue on to the sand like a bolus of clay. “Ugh. Like rubber.” He took out his red handkerchief and wiped his tongue. “Both of you made the same elementary mistake. You were so concerned with how the picnic might look, that you forgot to imagine how it might taste. Now do it again, only this time try to visualise yourselves having to eat the picnic. The most delicious picnic that ever was. Remember, there’s nothing worse than a picnic that looks good but which you can’t actually eat.”

After another hour and several more unsuccessful attempts the three of them finally sat down to enjoy the picnics that the twins had made with their djinn powers. The twins ate while Nimrod talked.

“Now this is much more like it,” he said, tasting their respective picnics. “John, this popcorn tastes, er... just like popcorn. I can’t imagine why anyone would want to take popcorn on a picnic, but there’s no accounting for taste. To me it has always tasted more than a little like polystyrene packing. And Philippa, I can’t remember ever having tasted a pretzel stick that tasted more like a pretzel stick.’ He shook his head. “Really, I must have a word with your mother. I can’t believe the kind of picnics you must have

had.”

“I can’t believe I’m eating food that I made out of nothing,” admitted John and opened a third packet of crisps.

“That is precisely what was wrong with your first attempts,” said Nimrod, helping himself to some of Philippa’s cheesecake. “The thing is, you’re not making anything from nothing. Certainly not this cheesecake. You make things from the energy source that’s within you. The subtle fire. Remember? And the elements that surround you, of course.”

“How does it work?” asked John, forking a slice of cold ham and some pickles on to his place. “Djinn power? I mean, there must be a scientific explanation for it.”

“Er, some djinns who were scientists have tried to understand how djinn power works, yes. We think it has something to do with our ability to affect the protons in the molecules possessed by objects. Making something appear or disappear requires us to add or remove protons and thereby change one element into another. When we make something disappear like that rock, we are subtracting neutrons from the various atoms that make the rock. So you see there’s nothing magical about it. This is science. Physics. It’s impossible to make something from nothing, especially a good picnic. Now if you’d said you’d made it from thin air, you’d have been nearer the mark, John.”

Nimrod yawned. “Anyway, I think that’s enough practice for today. It’s best not to think about the science too much in case it affects your ability to use your power. It’s a bit like riding a bike in that respect; easier done than explained. Next time we’ll try you out on making a camel appear, or disappear, something alive. That’s much more difficult than a picnic. Creating something alive can make a bit of a mess. Which is why we do these things in the desert where no one really minds if you make a creature that’s inside out…”

"I got Kevin" (r/Kevin)

Over at /r/Glitch_in_the_Matrix there's a story of strange phone goings-on:

Today, December 9th I go to call my mom to tell her a funny story about old people waiting for the traffic light behind the phone truck but I can't seem to get through to her, finally get through but it is really static filled and my mom says something weird is going on with my phone. I finally get home and try to call back and I hear a man's voice say hello and when I respond the phone rings again. Try and try again and I get this weird message about not saying anything, its one of those automated voices but it sounds more human. I try one last time and I get the man's voice and I ask who is this because I'm calling my mom and in a rude manner he say's "Kevin, what do you mean who's this?" and when I go to explain it rings again then clicks off.

So obviously one of you guys has been messing with the phones again. I particularly like how, being a Kevin, he is indignant that he has not been immediately recognised as such - surely it's obvious! Kevins are a class apart!

From now on, when someone's phone isn't working properly or they can't get through and get a stropmy response, they'll say that "I got Kevin".

* * *

TG Comments: /r/DimensionalJumping

POST: Changing the physical and the mental

There are no restrictions I'd say, but it comes down to that "plausible if unlikely" thing. To some extent, your own patterning matters here. The instructions try to encourage not really thinking about it, just doing the exercise and carrying on, because the more philosophical amongst us start to contemplate things like: "surely material change being 'heavier' and harder to move", and things like that.. Which is why it pays to think of those "imagination rooms" and so on: the "physical" isn't 'stuff' that happens 'out there' and has to come to you. But that's just my thinking on that: whatever happens for you, that's how it's played out. You can't really specify the route by which anything happens in this exercise, after all; it fits into the context we’ve set up (so the understanding goes). Exploring how and what works and drawing conclusions is what it's all about!

(It's definitely an ideal method for mental change though.)

That was something I considered, unfortunately it's just my nature to analyse things, I'm more hoping a newbie might give this a quick read and I guess try the easier thing first, then forget about it, but introducing layers and lessening belief in the physical changes happening may have been the wrong idea.

If you are ("one is") already embroiled in 'matters philosophical', then working through it all to see everything as 'sensations floating in imagination' is a good way to get through it. If you're not though, I think it can be better to remain ignorant, and let experiences lead you. If there's just minor confusion about the whole thing, adopting one of the metaphors provides a logically patterned path/explanation/route. It's the "faith" thing: those who are willing to have blind faith in the process, whether that's the traditional "[Entity] God will provide" or it's "dumb patterns get updated automatically", tend to allow the world to shift more easily. A second group might adopt an active metaphor to aid this. The third group have a strong image of the world as a "spatially-extended place unfolding in time" and, although this doesn't inherently limit results, it does make it less likely you'll simply allow things to shift, following the last instruction ("put the glasses away and carry on with your life" in the knowledge that it is done). The glasses exercise (along with the owls) is basically a demo exercise, though. You get results that show there's "something going on" and that hopefully gives you confidence to experiment more directly with the-world-as-imagination.

...That's an excellent approach. I've done something similar, although I wasn't thinking of it as "the subconscious" as such. For me (and most people I've discussed it with), focusing on the hara tends to immediately be an opening out into all space, a little like putting a drop of purple colouring into a water and suddenly the property of "purple" becomes everywhere. Placing a feeling or property or fact there corresponds to soaking your entire space with that feeling. Amazing how something so small can have such a dramatic effect. If you haven't checked this out already, you might find the exercises in chapter 4 of The Michael Chekhov Handbook. The 'atmosphere' exercises give one of the nicest descriptions for exploring applying an attribute to experience, in the way you describe. Although you're obviously comfortable with slightly mystical language, I've found that book (intended for actors) and the Missy Vineyard book (intended for posture and ease) a great way to get people to explore the "imagination-ness" of their experience without having to confront the philosophy or strangeness too deeply initially.

EDIT: Yes, interesting. Creating 'atmospheres' is quite a good way to avoid getting hung up on specifics if that's something that's problematic. And it also avoids need to maintain something, which people who try to "raise their vibration" often struggle with. By creating a background property that is just "there", you free yourself from the tendency towards micromanagement. And as to money: it's a very abstract thing to try and deal with; it has no felt properties for most people. I think ideas such as "wealth" are probably better. If you can't summon a sensory aspect of something, then you don't really know what you are trying to create in the first place.

It's kind of magical, the auto-posture-correction that happens. And the other stuff...

I went through a phase of, not having realised what I had been doing, screwing it up, and so had to become actually conscious of it. If you centre your attention in your head at the centre line you get the same effect, but our bad habits tend to mean we lose it after a while by shifting our attention. However, when I went to bed at night I would always "rest" in that location, and no matter my condition that evening (party adventure fun or whatever), I'd awaken "resurrected" next day. When I stopped doing that, things began to fall apart very rapidly! All to do with getting stuck in a particular state. On the power thing, I find expanding your "presence" to include and fill the space behind you, and down into the ground (a half mile should do it...) brings that magic mix of stability and intensity. The more of the world that you include "within" you, the more powerful and assured you tend to feel, I have found.

I will surely give this a go, seems pretty easy. (Micheal Chekov's exercise isn't it?)

Just be sure to be aware of a mistake you might do at first, which is to divide yourself into two (trying to "do" the expansion from one location while pushing out into another) rather than "become" that space. Chekhov (or really Lenard Petit teaching Chekhov) has an exercise where he explores what he calls the "backspace" by pretending you have eyes on your shoulder blades, but since you know what's actually happening here, you can just go straight to the expanding-becoming into/as that space. My own approach has been to just "switch context" to the infinite background space, which has the side-effect of releasing your hold on all content, and then change experience by imagination-intention. But describing things that way kinda presumes someone has already bought into the "imagination space" view of experience - so Chekhov/Vineyard exercises, being unwitting about this, can be a bit more acceptable to the uninitiated. They are also a lot more fun than I am! (I've been pushing the Missy Vineyard book for years, along with the Andre Bernard one, but the Lenard Petit book on Chekhov is quite a recent discovery for me.)

I never intended it. I sit straight, absolute straight whenever I sit, totally unintentional. Just Miraculous if you ask me.

Indeed. You realise that you don't need to "do" anything. You summon the desired state, like inserting a fact into a particular future time slot, and the world-and-your-body just shifts effortlessly towards it, in the most efficient balanced way. It makes it so clear that our culture, and in fact most of the world, is running off an incorrect model of how actions actually work in the moment.

...Right, it's super-simple, exactly that - **"just decide!"**

It's just not easy to describe. You need the experience. Once you've got out of the habit of beginning a movement by "reasserting your current position", and instead just imagining the state you want to be in, everything comes for free. I'm quite keen for people to try this for themselves, since it is the essence of the whole "shifting state" thing this subreddit is based on - except in that case the "body" is the whole "world-pattern". World-pattern is to current experience as posture is to current body position.

the main issue with most of us around here or shall I say the world is the inability to not interfere

Agreed. The problem with this is that when you do the surrender thing initially, you get lots of "stuck thoughts and incomplete movements" finishing themselves off, and that can be uncomfortable. Which is why I'm a big fan of recommending people do 10 minutes of "giving up" every day, specifically giving up control of attentional focus. In other words: "cease and stop generating". This lets things disentangle. Because really, you want your 'rest state' to be open and balanced, ready to shift in any direction without blockage, and any unfinished business gets in the way of that, or leads to avoidance. You can deliberately intend this by overwriting yourself actively, but that rather presupposes the very thing you are trying to persuade yourself of...

Zen Body-Being is excellent too (by Peter Ralston for those don't know, see short extract here). I put together a bit of a reading list for one of the other subreddits; I should maybe set up something similar here, with a short paragraph for each. Really though, I think Berkeley-Spira-Bernard-Vineyard-Petit-Ralston is a sound basis for personal exploration, giving multiple views of the same concept, but each with a practical aspect. There's not much point in reading endlessly; playful experimentation is the key, and then consuming imaginative fiction to fire yourself up with ideas for metaphors.

...

Okay, here you go: recommendations plus quickly-typed summaries. First link goes direct to a PDF, the other links go to sample extracts so you can judge whether to invest.

- Three Dialogues, George Berkeley: It presents the view of philosophical idealism in the from of three dialogues (funnily enough). In conversation, our heroes explore the nature of experience and come to some interesting conclusions. For our purposes, you should interpret the "mind of god" here to something like "the background awareness".
- Ideokinesis, Andre Bernard: This is quite similar to the Missy Vineyard and Eric Franklin takes on movement. Again, it's about using 1st-person imagery. However, Bernard's description is streamlined and clear, with the principles for imagery nicely laid out. It's directly from the 'original lineage' of this approach.
- Presence Vol I & II, Rupert Spira: Here, Rupert Spira takes the reader through an investigation of the nature of experience, revealing it to be sensations, perception and thoughts arising in awareness. His approach is to point to the direct recognition of this, rather than exploring it conceptually.

Recapping the other links: Zen Body-Being, Peter Ralston; How You Stand, Move, Live, Missy Vineyard; The Michael Chekhov Handbook, Lenard Petit (esp. chapter 4).

POST: Suggestions

[POST]

Hi guys. I have a couple of suggestions. Thinking that dimensional jumping is meant literally, newcomers often react, very reasonably, with incredulity. To help clarify things for people stumbling across this sub, I suggest that a plainer explanation for the sub's name be included in the introduction. Maybe something like TriumphantGeorge's explanation rewritten would help clarify things :

- *Yeah, the sub's naming is a historical accident really, as reflected in the intro post. Initially it wasn't really "about" what it's become about - that is, having fun exploring the nature of experience for curiosity and utility - and although it's a quirky and provocative name, it does make the initial impression misleading for the casual reader (or the skeptic who isn't a skeptic and is looking for a fight). But on the other hand perhaps a strong and engaging image gets people thinking in a way that a more dry or abstract presentation would not.*

The following text might prove more useful included in the introduction as well. It's currently at the bottom of the sidebar and, unfortunately, it seems people tend to skip reading that in its entirety, if they read any of it at all.

NOTE

There is no established theory of "jumping" or its mechanism, although there are numerous ways of viewing its nature. **It is for readers to decide for themselves through personal investigation and introspection whether jumping is appropriate for them or not.** An open mind combined with healthy caution is the correct mindset for all approaches targeted at the subjective experience. Never believe something without personal evidence; never dismiss something without personal evidence.

This is important as it establishes the the general attitude that we have in this sub, a balance between curiosity and skepticism, encouraging exploration but never requiring anyone to place faith in anything besides their own mind and first-hand experience. I know there's more than enough info with which a newcomer can get started in the overview section of the sidebar and the stickied posts, but, evidently, based on the commonly asked questions seen in the sub, many don't make the effort to read through those. At the very least, we can easily respond to posts asking if this is a long-running joke or fictional subreddit as well as troublemakers making unfounded claims that this is a brainwashing cult or some shit with a simple "Read the short introduction on the sidebar, please."

If they read even just the introduction, it would help clear things up a bit and we can continue with a more informed discussion. If they don't bother reading it or outright refuse to do so, then we can avoid wasting time and effort explaining the ideas behind this sub, as they are obviously unwilling to examine those ideas and will most likely be incapable of understanding them anyway.

[END OF POST]

Agreed. Adding the 'note' section now. The intro might be due for a reworking soon anyway; when it hits 6 months will have to remake it anyway because reddit will archive it. (I have been maintaining a certain level of continuity with the origins of the sub, out of respect a bit, but I think some updated context makes sense.)

Thanks George. Btw, I love the Owls apparel ad :D Had a good chuckle over that one.

It's a great suggestion, and I think the timing is right. It's easy to forget that we've actually got almost 6K subscribers now, and we're getting mentions outside of reddit (often due to misunderstanding the nature of it). I think what we'll do is, when we update the intro post in the next month, we'll do it as a version which combines that comment and the sidebar, and move the techniques, the key posts, and other stuff into the wiki. If this doesn't happen, feel free to remind me. (Related: It's only recently that I realised that the mobile app hides the sidebar; I always use the website-via-browser on mobile. This probably contributes to the problem.)

Haha, yeah, I had Photoshop open and couldn't resist mocking something up and putting that little easer egg link there, given OP's insistence that a subreddit like this should have some merchandise on offer. At least, I think that was the constructive suggestion he was making? ;-)

Q1: Do you think it would be worthwhile to create a new subreddit and post a sticky thread as well as change the sidebar to say this subreddit has migrated? Or even close it completely so when people try to access /r/dimensionaljumping it simply shows up with a message which says this subreddit is now at X subreddit? The name is really giving people the wrong impression.

Yeah, that has occurred to me too. Actually, people do keep requesting joining some dead subreddits I've got which were set up for exploring this sort of thing (the practical application of philosophical idealism) as a follow-on from some other philosophy stuff I was involved in, so there's an appetite for it. Maybe instead of updating the intro next month, we could launch a fresh subreddit which makes the central concept and attitude more obviously central, rather than one metaphor that's controversial due to (as others have pointed out) its apparent similarity to "many-worlds", which tends to be taken literally. Be interested to hear what others think.

I agree. A reboot would solve many problems. We might even leave open the old sub, for those interested in exploring the topic only from a physicalist point of view (alternative timelines, MWI, consciousness transfer, "other you" issues, etc.)

Of course, I'm not the originating moderator here - but if it were just my choice, I think I'd lock this subreddit and have it as a read-only historical resource - because all the old posts would be here and it would be mixing two things up to let it devolve into something else (those posts and ideas would still be associated with "dimensional jumping"). Alternatively, "recondition" it so that the former key posts aren't prominent anymore, and let it return to its "mirror method" origins. More to think about.

Q1: I think that these are both excellent ideas. Reconditioning it to the "mirror method" is probably the best outcome, especially since it seems like the original creator intended it to be like that anyways. If it were reconditioned, locking it up is also a pretty good idea. I think it would be a bit irresponsible if it weren't read-only, since I imagine that you will move on to the new subreddit. Without you helping them, most people will get stuck thinking that there are actually multiple physical dimensions, especially if they get results with the mirror method! If the move were to happen, it would also be really nice if you provided a key post underlining a basic, clear explanation of the underlying concepts - think what is a pattern level. I think that lots of people who are past the something is going on level get lost quite easily since it is not trivial to find basic, fundamental information. Note that this is not a criticism of you. I understand that it gets tiresome to start from the foundational level each time you use terms such as patterns.

All good points. I think there's definitely a case for refactoring stuff into a wiki to solve some of these issues, so that the subreddit has a "memory" rather than things being lost, rewritten and rediscovered in the posts and comments. (This could involve both wiki pages and key post links, and some sort of FAQ.)

Although there are patterning-related links in the introduction, they're not very prominent and they're also not very introductory. And the overall structuring isn't clear. Even though we introduce things in reverse, the "explanation stack" is probably something like: "awareness" => patterning => active metaphors => exercises. There is a slight issue with being too definite about things beyond the first stage - but that's where being clear about the "correct attitude" comes in. That open but questioning attitude is probably 50% of the value in this, perhaps.

Paging the other mods! Is the original mod even active anymore?

The originating account isn't, but the other mod is. (I'll bring it up explicitly once the ideas have evolved a bit as to the options.)

...

Additionally, we should probably emphasise a bit more the idea of the "open verdict" - As in, you don't actually need to have an opinion or belief about something, unless you need to make a decision based upon it (and even then, you are just making the best choice "as if" it were true). Instead, you can simply treat ideas as interesting or fun or useful, rather than "true". Pretty much every idea that's currently popular will either be cast aside, reconfigured due to a change in context, or simply forgotten as our culture moves on (and ideas are cultural I'd say, rather than aspects of "reality"). Expanding on that sort of "meta" stuff might be a good thing for us to do in future.

you would be a great sociologist :-)

Or a robot! :-)

POST: I think my imaginary friend might have accidentally explained how dimensional jumping involving water works...can someone please verify this?

Well, let's remind ourselves of the Law of Metaphor: *"However you imagine that it works, That's how it works."*

There is actually no specific "how it works" when it comes to the two glasses exercise; there is no mechanism involved. And the instructions are structured accordingly. However, in the spirit of "active metaphors", it's perfectly fine to adopt a pattern and format things with it, based on your pal's output or any other apparent informational source. All part of the fun. Vitamin C is rather good though.

Q1: "However you imagine that it works, That's how it works."
Are there any exceptions to this law? How do we explain those times when something trusted and reliable (a technique, a device, a paradigm, ...) that we're sure will work, unexpectedly does not?

It's really a way of saying that there is no "how things work", that there's no mechanism behind the scenes, only a patterning. And the extension of that is: you can pattern things deliberately. There's a difference in intensity, perhaps, between "kinda thinking something might work this way" and the patterning of things (and remember: there's also the patterning that has been accumulated so far). Typically, it's the difference between imagining-that something is the case, versus just thinking-about something. Formatting vs contemplation.

Q1: So, when "it doesn't work" is because of low intensity or strong pre-existent interfering patterns...
you can pattern things deliberately
But there is no specific "how deliberate patterning works" either, I suppose. Is it arbitrary turtles all the way down?

Yep, them turtles! The "patterning" metaphor is itself just pattern - but one that's deliberately abstract enough to hold everything within it, but still structured enough to be useable as a description, and as foundation upon which to conceive of change. This is why, for convenience, we separate things out into the content of experiencing and the nature of experiencing. If you keep trying to understand "how things work", you don't actually find out anything, you just keep having... more dream.

Additional thoughts on that - While you might conceive of there being "levels" to the world, granularity, and drilling down deeper into reality by investigation - in fact you are only ever at the same level: that of "experiencing". Say, if you used equipment to look at a wooden table: you see the table, then you see wood grain, then molecules, then atoms, and so on. Are you getting "deeper"? Are you getting "behind the scenes"? Only within your conceptual model of things. In terms of the content of experiencing, you seem to be doing so. In terms of the nature of experiencing, you are still just experiencing 3D-immersive-scene imagery arising within the "open aware perceptual space" that you are. Imagine a series of photographs documenting a journey to the centre of the Earth. The photographs depict going down a long tunnel, dodging lava flows, strange diamond caves, and finally a battle between dinosaurs on a beach at the every centre of the planet. But: do the photographs themselves ever change their level? If the photographs had been created by an artist in a studio, they would still depict the journey; how would this change things?

And so - Returning to the patterning metaphor, it's all part of this idea of "active metaphors" - that by adopting a pattern, we reshape our state, and it becomes active in our ongoing experience. This is the broader version of simply asserting a specific fact. Instead, we are asserting a "how things work", which will in itself shift experience, and also further enable new facts. With no fundamental "how it works" at all - only that we are an "open aware perceptual space" that "takes on the shape of" a distribution of fact-patterns as a state, and even that is not really sure - we are free to assert one. We are the only mechanism involved here, and our structure is the only structure.

I agree, but our waking life appears to be much more reliable and "solid" than the erratic visions we see each night.

Yes, but you can fairly easily make persistent dream environments that are just as stable as this one. The more your explore dreaming, the more it seems that the only difference is that you return "here". And if one day you didn't return here, or woke up from here, that would be that I suppose. The act of assertion itself has no mechanism, is simply "is" - a reshaping of yourself, by and as intention. The intention itself ("an intention" = the fact-pattern being intensified, "intending" = the intensification) has an implied "how certain aspects of the world works" within it, as part of its extended pattern. For example, simply wanting a new car implies certain formatting, such as 3D-space all the way up to various textures. Assertion always works in the sense that the intentional pattern is intensified. The way in which is might "not work" is that the experiential results aren't what you desire. The "culprit" here might be: the context of the intention (e.g. just visually imagining something without context, without deciding that it means-that something else) - or the patterning/formatting that is already in place, the facts you might benefit from reducing the intensity of - or simply the intensity of the pattern might need to be stronger, in terms of being relatively factual.

Q1: And if one day you didn't return here, or woke up from here, that would be that I suppose.
Whoa! DREAMensional Jumping!!! 8-O I'm skeptical on this, but I'll definitely resume my lucid dreaming exercises. This stone cannot be left unturned.
or the patterning/formatting that is already in place, the facts you might benefit from reducing the intensity of
How do you "unassert" an existing pattern?

Well, here's a sense of what you're aiming for: "persistent realms"

In terms of "un-asserting" a pattern, it's typically best to be asserting a positive pattern or target I'd say - by which I don't mean upbeat, I mean it's framed as "this" rather than a "not-this". For example, if you've got a limp from an accident, it's generally easier to assert the fact "walking normally" rather "fixing the limp". The latter is involves an indirect intention. By "indirect intention", I mean that you explicitly or implicitly intend that an act means-that your limp gets better, via a conceptual pattern. In the limp example, sometimes people would imagine some sort of healing light and all that stuff. From a pattern-based viewpoint, one might pause and form "the background" find the "fact" of limping, and having got a handle on that fact, dissolve its intensity. In general, if you view yourself as an imagination space with all facts dissolved into the background - with the ability to assert that something is true, or that an act or experience means-that something is true - then you can't go far wrong.

Q1: Ok, an "acid" pattern neutralizes the "base" pattern...But, if it's just a matter of decreasing intensity, an obsessive and repeated assertion of the new fact should be faster and more effective than the "assert it once and carry on with your life" praxis...How does detachment fit in the puzzle?

In this description, "assert it once (without obstruction)" can be thought of as overlaying a pattern onto the pre-existing landscape. Hence "plausible if very unlikely-seeming" results, within the bounds of what is allowed, as it were. So although "assert it until it is true" is what you'd want to do with anything disruptive or novel. For instance, you want to create an "imagination object" to assist you, that's what you have to do, and direct fact assertion can perhaps be viewed amendment of part of the "world object". Most people don't really know how to "assert" or "intend" anything; it so it's achieved by implication or misdirection, as with the two-glasses exercise. Typically, once people start trying to assert something directly, they encounter the problem of "doing". You can see this in everyday life, where people wrestle with their bodies in an attempt to move around, intending staying still and moving simultaneously, as they try to "do" movement. Detachment - probably better phrased as "non-attachment" - would be the non-triggering of patterns, attained by ceasing to control and narrow one's pattern- or spatial- attentional focus. Really, what we're after here is no cease interfering with, or reacting to, unfolding sensory experience - because that amounts to a "re-intending". Basically, "be okay with whatever happens". Being in this state means we are not obstructing the state-shifts that arise from/as intention. The feeling could be described as a flowing: the state is stable, the sensory experience is unfolding "by itself", occasional intentions to shift state and therefore redirect experience.

POST: How long does it take to see results?

I say: **fuck that struggle stuff**. However, I'd also say: you might need to do more than stare into a mirror, as if the mirror-staring was itself going to do anything in and of itself. If your theory is correct, then surely it implies that no physical activity within your this-world experience could cause anything? It would all be "sensory theatre". What you'd actually be seeking to do is to switch from one 3D-immersive line of thought, to another one. You would also implicitly need to accept that everything you experience arises within your "thinking space", and there's no "outside" to that. Essentially: you have your own copy of the world, and you're not really a person in that world either - you just "that which experiences".

I'm trying to say fuck positive thinking because I absolutely have tried it, for months on end, and it just doesn't work.

Well, the whole "positive thinking" thing rather depends on how, exactly someone is thinking. There's a difference between thinking something (intensifying that pattern) and thinking about something (imagining it in its own little bubble), for example. It always seems a bit odd to me that people would advocate things like "positive thinking" without going into what they meant by "thinking" - it's not at all obvious. Perhaps people just don't want to commit to saying something is possible if they haven't done exactly that themselves - which is not a bad rule to go by. I would tend to say that in principle anything is possible, but with some things you might have to reconsider how you think things work - by which I mean, the "nature of experiencing" and what "the world" is - if you don't manage to cheat yourself to them via misdirection. If you can't explain how you lift your arm, for instance, how can you work out how to change your facts?

"Time" is a concept - all you ever experience is The Now. You might have experiences which are "about" the past, present and future, but you will still only ever be having experiences in The Now (because there is no other place, and even that isn't a place, it's just you). Always keen to save myself typing: this comment [POST: Hold your horses.] about the assumptions we make as to how the world is structured, specifically that "space" is a part of experience, rather than necessarily part of the world.

EDIT: While "dimensional jumping" is not literal (in the sense of "the multiverse" and all that stuff), and it's about exploring with changing the content of your own experience, it would be a mistake to think of it as psychological either, in the sense people usually mean. The main point is to explore the nature of experience and see what you come up with, drawing your own conclusions.

Q1: I had a strange glitch earlier, this post being at the top, and showing that it only had 4 responses. I was viewing it on my mobile, and suddenly the page kinda glued itself, me being unable to move it up or down. Perhaps that was the sign of a shift I've been looking for? Of course it reverted back, and I won't look into too much, but interesting none the less.

I wouldn't overthink these things - after all, mobile apps are glitchy enough anyway - but then again, anything which makes you more aware of what's happening in the world, gets you to pay more attention, is a good thing.

POST: Need help putting this all together

I tried the 2 glasses technique just a few min ago. I wrote fired in the first glass and not fired on the second. I don't think I concentrated as hard as I could have. I spilled a little water on the pour and then again when I drank it.

Don't worry about spilling a bit. If you are unsure of yourself, just redo the exercise in a quiet moment. Don't worry about "concentrating hard" - the instructions don't say anything about having to do that. There is no effort involved in this; relax and enjoy pouring some water. Just follow the instructions! Especially the last one. And then wait, say, a week and see what happens. The ideal mental approach to this, is to treat it like an experiment. You are conducting an experiment, an investigation to find out something about the world, using a desired outcome as the target. (I get that this can be difficult for things you have become desperate about, and it's okay to fret a bit, but "not interfering" is what you want here.)

POST: Is there a limit to the 2 glass method?

Don't say "and stuff". Just say "magic powers".

POST: Lurker with a question...

So, my question is, is there, or has anyone experienced what might be called an emergency jump? There's a reason I'm asking, just a bit reluctant to share it at the moment.

I'm reminded of this link and conversation [Sleep Out Of Jail Free], perhaps.

Q: Thank you, that was actually very relevant to my experience. It happened just last night. I was in bed and woken up by what sounded like a jet flying over where I live. Shortly after that I heard a blast and everything lit up quite brightly. I remember thinking "Looks like it finally happened. Guess it's time to die..." Then my next thought was "No, there's more I need to do, it's time to wake up." And then I fell asleep, woke up here just fine, the only thing was the side of my body that was facing the light, was warmer than the other side of my body when I woke up.

There have been quite few accounts, elsewhere, of people having dreams and waking up with the corresponding marks and scars. Which isn't to say that where there's overlap such things are "just" a dream; in the broader sense it could apply to any sequence of overlapping experience where aspects of one experience are carried over a discontinuity or "boundary" into another.

POST: A Few Questions Before My First Jump

First, do read the sidebar text.

Other than that, just super-quickly:

- a) there is no "other you";
- b) there is no "monkey paw" effect, there's no more likelihood of negative outcomes than there is when pursuing something over the longer term in the usual way, so you can think of it as simply accelerating a change;
- c) no more chance of "going wrong" than any other choice you make;
- d) you don't reverse a change, you simply make another change in the direction you now want to go;
- e) if you make a change then, just as normally, whatever else is implied by that change, whatever logically makes sense, is what will change also, although some of those connections can be hard to anticipate of course;
- f) each change should be considered a fresh amendment, there is no reason why one would affect a previous one unless they overlap in type, it's like a "landscape" that you are gardening - changing something here, then changing something there.

Really, though, just do the exercise. Treat it as an experiment you are conducting into the "nature of experience". You conduct the experiment, notice the results, learn something about the nature of the world and yourself. You can think about it all you want, seek reassurances and so on, but really you just have to do it and find out what happens for you. This is no different to any other decision or course of action: you don't get to "pre-know" your experience before you actually have it. And, as things generally go in life, this is pretty much the height of a zero-effort, zero-consequence experiment, surely? Ultimately, it is beyond description, **you just have to do it.**

POST: Two Cup Method Questions

[POST]

Hi everyone, I'm new to the Dimensional Jumping subreddit, and I had a few questions related to the Two Cup Method.

1. How long does it usually take to see signs of the Two Cup Method working.
2. If you wanted to could you potentially use the Two Cup Method to get powers? I'm asking this out of curiosity.
3. Can you potentially modify the Two Cup Method for your own personal preference?
4. How will I know that the Two Cup Method has worked?
5. Are there any other methods to Dimensional Jump besides the Two Cup Method and Mirror Method?

[END OF POST]

Quickly (but see here [POST: A Few Questions Before My First Jump] also):

1. Give it a week, perhaps.
2. Generally the results are not "reality rule-breaking" but there is no reason in principle why you couldn't use it to change any pattern that is contributing to your experience, including more basic "formatting".
3. Of course, but it would be a good idea first to both get some experience by conducting some experiments with it in its current form (it is deliberately constructed this way), and to understand why it is structured the way it is (otherwise how can you know what to modify?).
4. You'll know that it has worked, when you experience the outcome that was the target of the exercise (it is better to think of it as an exercise or experiment, rather than a "method").
5. In truth, **there are no methods as such** - there are only different ways to go about "re-patterning" yourself in order that your subsequent experiences are in line with your amended state. (The other basic exercise is the owls exercise, though.)

The general idea is that, by experimenting with these exercises and observing the results, you come to a more general understanding of "the nature of experiencing", and take things from there. Ultimately, then, this should be viewed as an investigation, with these deliberate attempts to bring about outcomes being the springboard for that.

Regarding your second point, does that mean for reality rule breaking jumps/bigger jumps, we're better suited with the mirror method?

Or perhaps some method of direct imagination, rather than just leveraging pre-existing world patterns (which is what the two glasses exercise does). But, as always, it's really something to experiment with yourself, see what happens.

Ohh okay. So should I just attempt really detailed, specific visual meditation? Do you have any recommendations how exactly I should go about it?

The visual aspect isn't necessarily important as such. Still, for this sort of thing, check out the links in the edits of the Neville Goddard post (use the search facility) - the docs linked in EDIT3 are pretty good for that stuff, as I recall.

POST: Love and the Hall of Records

You'll still experience the record, with your friend's character still seemingly interacting with you, but your friend will not be playing the character anymore, it'll be an empty shell of a character, or may be played by a different customer.

Ultimately, though, where this goes at the end of the metaphor is that there are no different customers - and in fact, not even one customer, **because "awareness" is uncountable.** To expand -

You can think of the records in these stacks as being more like multi-player video games, with lots of interacting players.

However, since there is only one player - "awareness" - then it's more like a single-player game in which the different video frames are experienced. Or more correctly, there's not actually a player at all, because "awareness" is more accurately conceived of as a "game-space" which 'takes on the shape of' a particular game (with all possible games dissolved within it, eternally available). So although might say that "all records in the Hall of Records will eventually be explored", but I'd suggest that since the records are "before" time, this is a meaningless phrase. "Time" is an aspect of experience, not of the Hall of Records itself. And the player isn't in the game; the game is in the

player-experiercer. Which means that the whole game is "made from you". No person has free will, including the person you apparently are. The only free will that there is, is that of "awareness" itself, so you can't violate anyone else's free will, because there's nobody "out there" that has it. Or if you take the view that selecting "records" which involves others doing things you want a violation, then you also have to consider redirecting your own person's path as a violation, because you are not that person really; it's just the perspective. Now, this all sounds a bit empty. "Where is the love?", you might ask, if there are only images or sensory records, and no people as such. But you don't, in fact, love people anyway, I'd suggest. What happens is, that certain conditions, certain states or experiences, have as one of their aspects the experience of love. And I'd further suggest that the experience of love isn't contained within the content of a record, but rather it is the experience of open awareness itself. And although the idea of that is somewhat cold, the reality it points to is the very opposite; it's the fundamental aspect from which all good things "borrow" their quality. To use a cliché, it's like experiencing a calm area in an otherwise stormy pool of water. You are the water, those you love are the calm areas. They are not "soul-mates", they are - if you like - openings within your own soul (the only one there is, meaning "awareness"). Now, the outcome - that you will treat other people with respect - is much the same, but that's because intending unpleasantness is a reshaping of yourself into a state of unpleasantness - and because intending situations which remove apparent people from your ongoing experience is to remove the easiest possibility of experiencing love. (An additional side effect of this view is that all people are "eternal", because they are effectively patterns which are always present, "dissolved" into the background of you-as-awareness, and because what they really were is actually the only thing that is fundamentally true: awareness.)

Aside - Another useful metaphor along the video game line is that of electronic golf setups, perhaps. In front of front of you is a beautiful golf course (world full of people) apparently, but really it is an image, and your actions do not in fact affect a "world", rather they reshape the image on the screen. So you assume you are affecting something external, something independent, but really all intentions are affecting the screen - the screen which is you. This means that it's not only valid in-game interactions which affect the image - that is, taking shots appropriate and consistent with the current picture being displayed - but any intention affects it. Although it is not hinted at by the picture itself, doing things like battering your club against the screen (being aggressive, violent, hateful) in fact also affect the gameplay, just as much as taking shots, because all actions are a reshaping of the screen/image. Taking shots updates the position of the ball and your onscreen location, sure, but meanwhile you other actions are affecting the golf course, including whether spectators and fellow players that appear onscreen.

Q1: At the ultimate level of reality you are correct. However, almost nobody reaches that Buddhist level of enlightenment, most fragments of awareness still experience themselves as separate for quite some "time" (outside of time, of course), so I think my elaboration of the Hall of Records model still has value for this "middle" layer of reality. Also, there is a question of measure (in the mathematical/probabilistic sense): all records may be experienced by the single awareness that exists, but maybe not with equal intensity/intention. Here I'm going to use the metaphor of a quantum-mechanical wavefunction: some parts of the experience-space have low probability/measure, although all of it is integrated and affected by the equation that governs its evolution. In a metaphorical sense (realizing the limits of language here). But what I'm really trying to do here is motivate an idea that roughly corresponds with "karma" but without the punitive aspects imposed by Western distortions of the concept. We all suffer from the illusion of separateness, but we suffer more when our intentions isolate the fragment with which we identify. Here's another take on the idea [Boltzmann brain]... All models are wrong, some are useful, as the saying goes...

[QUOTE]

Boltzmann brain

The Boltzmann brain thought experiment suggests that it is probably more likely for a brain to spontaneously form, complete with a memory of having existed in our universe, rather than for the entire universe to come about in the manner cosmologists think it actually did. Physicists use the Boltzmann brain thought experiment as a reductio ad absurdum argument for evaluating competing scientific theories.

The Boltzmann brain gained new relevance around 2002, when some cosmologists started to become concerned that, in many theories about the universe, human brains are vastly more likely to arise from random fluctuations; this leads to the conclusion that, statistically, humans are likely to be wrong about their memories of the past and in fact are Boltzmann brains. When applied to more recent theories about the multiverse, Boltzmann brain arguments are part of the unsolved measure problem of cosmology.

[END OF QUOTE]

I'm wary of talking about reality (or: experience) in terms of "levels" - although a description can have levels, of course. **Experience just is.** We also need to be careful about "levels of enlightenment", because of course the fundamental truth is always true, regardless of your current experience. That is, "enlightenment" isn't a particular experience or a state, it is a recognition - a recognition of the nature of all experiences, always. But, of course, that's not to dismiss your elaboration of the Hall of Records model - it's a nice extension of it, expanding on a particular type of description. Like the basic version, it is not true but it can be useful - and moreover, one can have experiences "as if" it is true, even thought it is never actually so, fundamentally. Provided that is borne in mind, we can get a lot from it, and at the very least enjoy it as a narrative which might provide the seeds for an enjoyable worldview. A pattern we can adopt, even!

Meanwhile: do we suffer from the "illusion of separateness", or do we adopt the experience of apparent separateness? The difference is subtle, because the former implies the experience itself is an illusion, whereas the latter suggest that experience is just what it is, and it's our description of that experience which is false. In other words, our intentions don't "isolate the fragment with which we identify", because we never are fragments - we just have "as if" experiences of pretend fragmentation. I realise we're probably saying the same thing here, but I think it's worth talking about the same thing in slightly conflicting ways, just as a method for highlighting that things like "fragments of awareness" are part of a descriptive scheme, and we never actually are fragments of awareness (because that implies a description from a 3rd person "view from nowhere" what does not actually exist in experience, except as a thought about experience which is itself an experience).

On "karma": I think we can definitely construct a model of what I'd call "dumb patterning", which is to say that there's no judgment aspect, there's only a matter of the relative "intensity" or contribution level of a particular pattern which plays out while dominant. If you "intend" something (that is, "an intention" is a fact-pattern and "intending" is the intensification of that pattern's contribution to ongoing experience), directly or by implication, then that pattern contributes to experience until it is dissolved or exhausted. If you were to die (that is, your current experience of you-as-person reached a logical endpoint), for example, then those patterns would continue to contribute to the next-moment, whatever form that would take. To release karma, then, you would need to either counter-intend it in some way, or detach from it and release it, or otherwise imply that the pattern's intensity of contribution become zero. Obviously, there are parallels here with the "superposition of states" type metaphors you allude to!

Ultimately, though, I think the main insight we gain is that descriptions don't explain anything - they are "parallel constructions in thought" which can, if we intend in terms of them, also become the patterning (or even deeper formatting) of our ongoing experience. Hence, none of it is "how things are" or "how things work", but we can certainly have experiences "as if" it were so. Any description in terms of a non-1st-person view is immediately "wrong", however it can be used to generate experiences "as if" it were right. Which is good enough, I'd say (so long as we keep the distinction firmly in mind, so that we don't "fall asleep" in the dream of patterns).

Q1: Yes, I agree we are talking about the same thing, or focusing on slightly different aspects of the same thing. Part of any apparent disagreement is that we are using slightly different definitions of the same words (or I'm being sloppy in a rush to get it all down), and when we push language to its limits, small differences can seem to create conflict when there is none. I don't really believe in the literal truth of the Hall of Records model, or my elaboration thereof. It is simply a model, but one with a practical application: if I wish to preserve the experience of "love" (real or not in the ultimate sense), with those seeming-experiencers who are still experiencing my spatiotemporal realm concurrently, and with those who've left, then I need to be scrupulous about the freewill aspects of jumping. Last night, after I wrote the OP, I had a dream that my partner and I were walking on a street next to a river (one that exists in our neighborhood in real life), the street was crowded with people, and he needed a drink of water, so he went on ahead without saying a word to me. I was furious, and decided to make an abrupt turn and take a different route back to our house. Later in the morning I realized that this was a dreamscape dramatization of what I had just written (complete with water as a symbol of the 2-glasses method, which I happen to like a lot). This makes me think I am on the right path, at least in terms of my personal jumping experience.

I think you do not need to worry about preserving the experience of "love", because it is fundamental. It is not actually an experience as such - it is not content - but perhaps more accurately described as the background to all experience? In the same way that relaxation is pleasurable, but is actually the absence of obstruction, tension. (That immediately all sounds a bit romantic! But you know what I mean.) And since the seeming-experiencers (really, content of your experience) are "made from" that background, then you don't need to worry about "other people" in that sense either. (Interesting dream, nice bit of symbolic drama!)

Q2: *it's just the perspective*
then why bother with oppositional perspectives? i.e. people I despise - why should they exist?

intending unpleasantness is a reshaping of yourself into a state of unpleasantness
all that should be able to happen is that I desire to 'move' into a 'shape' or state whereby everything I despise no longer exists
of course you'll run in to the problem of other people choosing to enact their desire for "the world" to be as they choose, leading to an arms-race of sorts...a spiritual arms race, if you will... otherwise, what is to stop you or the Pope or anyone from imposing their version of true reality upon everyone on the planet, in the universe and me?

I disagree that you are in competition with "other people" in some sort of "battle of the wishing". Your world is your own, and the patterns you have accumulated are yours to address. Meanwhile, "true reality" has no versions; it is "before" that sort of thing. "True reality" is simply the fact of being-aware, and all other facts are relative only. Ideas like "everyone", "the universe" and "me" need to be treated with caution, especially the assumption that they are independent and "out there" somewhere.

POST: I just did the two cup method

I know its silly but i changed so i could have telekenesis lol but ill keep you guys updated if anything changes. Update: one of my passwords that i know 100% was right didnt work

Let me guess: you did the two glasses exercise for "telekinesis" and now everything feels "up in the air"?

(Sorry, couldn't resist.)

Up in the air? What does that even mean lol but the password change is the only difference so far

It's a pun! "Up in the air" is a (kinda cliched) metaphor used to describe life when things are in transition, nothing is settled - and the joke is that, if you had powers of telekinesis, then things would be literally up in the air. (Yeah, I never said it was a good joke.)

POST: [Meta Discussion] Awesome podcast about the perception of reality and using your brain to unlock the universe from a scientific standpoint.

Ah, it's Anthony Peake! Not listened yet, but I've read some of his previous stuff, where he talks of his concept of essentially (re-)living your life as a sort of memory, a version of the old idea of the "eternal return", and the idea that you could select different paths through that. Where he has fallen down previously, though, is in describing how this happens in your "brain" - when of course your "brain" would be inside your repeating experience, any evidence of it would be an "image" of the idea of a brain. So the "brain", as understood normally, would not be the context of experience. However, that isn't to say some concept or idea of a "structured, patterned environment" that you are selecting experiences from isn't valid - an eternal memory block, if you will. A couple of the sidebar metaphors already tap into that concept; it's the common way to get to an abstract notion of the world that doesn't imply an unobservable external substrate. Meanwhile - Kirby Surprise, in his book Synchronicity, explores much the same territory, talking about "brains" by actually reconceptualising them as "M-branes", and being careful to highlight that the description is an "explanatory fiction" and not "what really happens". It's very much a blend of Peake and the more abstracted stuff we sometimes discuss here. There's a good interview with him linked in the intro post which might make a good companion to the podcast above: direct link here [<https://www.youtube.com/watch?v=2-iMw9KA93U>]. Neither the Peake nor Surprise models could be studied "from a scientific standpoint", I'd suggest - only a metaphysical or philosophical one. They are not "scientific" ideas. That is not to criticise them, though; "scientific" isn't equivalent "real" or "true". By saying they are not "scientific" I'm just saying that, while you can explore them by personal experimentation and contemplation, you can't use the "scientific method" to study them, due to issues of falsifiability, repeatability, and the incompatibility with the "objective world" container concept. In this sense, concepts and theories like multiverses and string theory aren't scientific either. (Even the Daily Mail, the only trustworthy source of scientific information of course, gets that quote right sometimes!) This is why I'm always wary of people saying, "is such-and-such scientifically proven?" and "could we study this scientifically?", the implication being that their experiences aren't "real" if they can't be modelled "objectively". Something perhaps can't be studied scientifically, due to the "subjective" nature of the phenomenon, but they can be part of a structured investigation leading to useful descriptions, as here, where experiments are done and results noted and patterns observed.

Aside - I've brought this up before, but the models described in Quantum Bayesianism (see here and here) also have some overlap with this stuff. In particular, see the section discussing The Now in the Nature article. The author saps out of going all the way with this - not because the model limits it, but because he basically doesn't like the idea: "When you and I are communicating face-to-face I cannot imagine that a live encounter for me could be only a memory for you, or vice versa." This is key, however, and is something which comes up in discussion of the Hall of Records metaphor too. It is the problem of recognising that there are not two experiencers, and in fact not even one awareness - there is not "awarenesses" or "an awareness", there's just "awareness". Might follow this up when I get a chance to actually listen to the podcast.

Science can include non repeatable phenomenon. Objective evidence and reason are required for science. So some of these types of ideas could be scientific even if they lack reproducibility. And others such a precognition, if at the will of the person, could be reproducible and falsifiable in a controlled setting.

Hmm, I'm not sure in what way an idea can be "scientific" if it can't be repeated. Of course, there are various granularities of "repeatable" - no experiment can ever truly be repeated. A choice is made as to which aspects of the environment constitute "the same setup". I'm guessing that's what you mean. As in, no precognitive experiment could ever be entirely repeated, but multiple experiments exploring precognition under the same parameters could be performed. However, in the specific case of "multiverses", for example - and some of the areas that come into play in our discussions in this subreddit - we are talking about the entire environment being subject to change; the conceptual boundary which defines the objective frame is breached. That is, the only "aspect of the environment" that is stable is "that which experiences" (the "subjective context", you might say). At this point, "objective evidence" is a (potentially) meaningless notion. This is why we return to the idea that the only fact that is fundamentally, unchangingly true is the property of being-aware. It was always just a concept of convenience, of course, the "objective world" - it makes the thinking simpler, to have a fictional persistent substrate upon which everything else rests. However, over time it has been adopted as a literal thing, and now we're pushing against the limitations of that. At that point, though, we have to seriously reconsider what any experiments mean in relation to a concept of a "world". The standard description of the world as a "stable, simply-shared, spatially-extended place unfolding in time" becomes problematic. But that's the fun of it all, of course.

TriumphantGeorge Compendium - Part 5

POST: Can we jump dimensions just by making major life decisions?

Q: I've noticed that people get caught up on the title of this subreddit. It's a bit of a misnomer in my opinion. We are all constantly, from one moment to the next, "jumping dimensions". That's what reality is: Your awareness/self "driving" through an ultimately dimensionless Field of All Possibilities. "Jumping", making a major life decision, meditating, etc. are all just forms of "steering" your self.

Not "one moment to the next", though. It's important, I think, in order to make the metaphor useful for formulating descriptions and intentions, that we don't conflate sensory change ("moments") with changes of state ("dimensions"). The notion of steering might be better thought of as selecting, perhaps, to avoid the imagery evoking the idea of driving along roads turn by turn, rather than the more useful idea of defining/implying sequences and the entire route, but of course that's somewhat a matter of taste (provided the intended meaning of the metaphor is clear).

POST: Dimensional Jumping: Mirror Method

Basically, when you dig deeper, it turns out that there is no difference between "literally" jumping and "metaphorically" jumping. If there is no difference between having an experience "as if" you jumped dimensions versus "really" jumping dimensions, then it becomes a meaningless distinction. One might then consider whether your current experience is merely "as if" you are "a body in a world", rather than "really" being so. And so on.

POST: A TECHNIQUE that WORKS EVERYTIME for me. (plus some infos on DimensionalJumping)

The thing is real but the techniques here clearly show some lack of understanding.

Oh really? :-) Your post reads like a response to some other notion of "dimensional jumping" rather than the one here, surely - the name-only movie and magic version, perhaps.

Doing 5 minutes in that way is better than visualising it 30 days 24/24.

I think this is a response to some sort of law of attraction type thing? That's not what this subreddit is about!

Ultimately, I'd agree that the most direct approach to exploring changing anything is to completely imagine-that something is happening, in a fully committed way, such that ongoing experience is patterned. In fact, ultimately there is no method or technique or mechanism other than that, we might observe. Such things are just "sensory theatre" and are also results. Intention (and implication) is the only cause. However it's not usually a very useful instruction, to say a variation of just commit fully, since it effectively means you are telling someone: "the way you change is by changing, so just change!" - with no perspective upon which to hang it. That's why, instead, it can be better to present a way into the subject, to first demonstrate that "there is something to this", and to let them feel their way to a direct appreciation via personal investigation. This is more than just "learning to hack reality" though. The real aim is to come to full understand your situation - that is, the "nature of experiencing", what "you" and "the world" actually are and the relationship between them. Without that, basically everything we do is sort of nonsense. (See: this recent discussion, for example.)

And so...

As soon as we talk of "brains" and "mind frequencies" and "probably you's" as actual, rather than perspective-structuring metaphors, we are already drifting I'd say - although I agree that the TV channel metaphor can be useful as a way of thinking as indeed can the idea of fully switching directly. But metaphors is what they are - such things are never actually experienced as such, we only have experiences "as if" they were true. And descriptions or "explanations" are themselves just more experiences: the experience of "thinking about 'how things work'", something which is parallel other experiences, and never actually gets "behind" them. Because there is no "behind". This is an important thing to note, if we are not to lose ourselves in romantic notions of (for example) a new-age type reality story which is comforting or makes for a good pep talk but has no actual basis in experience, and so depends on temporary enthusiasm or the deeper patterning that comes from authorship ("it works because it is yours"). The latter of which is, I suspect, what your own success comes from - which is great, but that does mean it is unlikely to translate as is to others without context. _ EDIT: The post was removed for being more appropriate for LOA than here. Note that the author has reposted here in the /r/lawofattraction subreddit.

POST: I'm a bit of a skeptic, may I ask some questions?

Do any of you believe in dimension jumping but not any other supernatural things?

It's not supernatural, in the usual sense of the phrase. I'd even say it's not even outside of normal experience, really, since it's just the same everyday how-stuff-is, except pushing against some assumptions we have around the notion us being a person-object within a world that's a "stable, simply-shared, spatially-extended place unfolding in time".

How long do the changes take?

Depends. It's not independent of you:

To what degree does the butterfly effect play?

I'd say "the butterfly effect" isn't a particularly good metaphor for this, since the whole idea of a world "out there" that is being nudged and the repercussions flow in a sort of causal sequence can be problematic (see below also: the world is not necessarily an "objective place"). It might be better to conceive the world as an abstract "coherent landscape of facts and patterns", where raising up one fact deforms the landscape around it, fits the world to that fact, regardless of spatial and temporal considerations. (And this entire landscape is within you-as-awareness; there is no outside to it.)

Of course, if one pattern is that of "objects are persistent and previously-observed facts don't change" then any results you have would seemingly arise by more plausible means!

So, nothing would disappear or whatever, but a previous test you'd undergone might later turn out to be "in error", a sudden growth spurt might happen from nowhere - or more vaguely you one day might kinda-sorta-notice that you'd got taller without you or anyone really noticing, and when you ask they go "oh, you do look a bit taller" in a distracting manner, then go back to what they were doing. Anyway, you get the idea.

Is there any scientific proof for this?

It's a meaningless question, essentially, because we're talking about an area which is "before" the possible use of the usual handy fiction of the world being a sort of objective container of events. For example, you can't conduct experiments with independent observers, because "independent observers" is one of the assumptions we are investigation. Meaning: that it's a matter of direct personal experience and, then, philosophical or metaphysical discussion. There was a related discussion recently, here. (Do remember that you are not meant to simply believe in anything here. As the sidebar says, this is a matter for personal exploration, experimentation and contemplation. In fact, a core idea is that "explanations" and "descriptions" never get "behind" experience; there are themselves more experiences. Descriptions are used for thinking and patterning; they are never, and never can be, something that captures how-things-are.)

Finally, I wouldn't worry about your height: a) you are young when it comes to "vertical growth prospects", and: b) these sorts of things don't limit you anyway, which is another outcome of exploring this kind of topic actually.

POST: Jumped

Yeah, you have no idea the ways the Universe uses to achieve the results you asked for. Maybe getting shitty internet somehow causes situations to happen to ultimately leads to your desired results. Accept, embrace, and let it do its' job ;)

What "universe" is this? I've never seen a universe! I suppose you mean it in a metaphorical sense, though.

Of course! I've never seen a universe either.

I was just being playfully pedantic, really. Something I think can get in the way is taking the "sending requests to the universe" and "receiving messages" tropes literally, because they imply a mechanism or intelligence "out there" that does stuff on your behalf.

Q: Merriam Webster defines universe in a few different ways. This one works best for me in this context. "a distinct field or province of thought or reality that forms a closed system or self-inclusive and independent organization"
My universe and yours cannot be the same, but since each of us experiences only one universe, we have fallen into the habit of speaking as if that one is THE one. Technically we should probably be saying, "Send requests to your universe."

That's good. Similar to the intended meaning of "world" when used here (as in, not in the sense of being a "place"). Still, super-technically, we should be saying something like "reshape yourself-as-universe into the response-pattern implied by a request-pattern", perhaps.

POST: Something went wrong

Last night I did something called "sigil" with the same outcome. At all three methods I intended to get closer with another person. The outcome - the person got injury every time I did it. I don't have any new feelings after the methods above. But the times when it has been successful are only through visualisation and having the feeling of certainty or having had a feeling of the desired outcome. What goes wrong? How and why?

Did you try spending time being there for them, comforting them? Sharing traumatic experiences and supporting one another through injury are some of the many ways that people become closer. Sounds like an opportunity to me. ;-)

POST: Weird thing happened tonight.

Did anything happen regarding the specific intention, the target of your attempted "jump"? For anything else that happens, anything that isn't part of that deliberate aim, you can't really conclude there's a connection between them. Which isn't to say those other things can't be interesting, but it's another category of interesting. If you hadn't attempted a jump "a few months ago", how would you have interpreted your shower light adventure?

POST: Today I Learned: The guy who created Sigil Magick and Dimensional Jumping may have a lot in common

I've never noticed the connection between Spare and the mirror method before - well spotted! Others have proposed alternative, potentially more enjoyable, versions of the "death posture" (AKA exert-until-exhausted) approach, but I'll leave that to the readers' imaginations.

Q1: "I'm off to charge a Sigil" the Chaos Magician said as he headed off to his favourite porn site. Haha. Not too big a fan of said method myself though - tiring if you charge Sigils often, and never quite worked as well for me as the death posture. My alternative more recently though is just regular yoga poses. I'll pick one that's uncomfortable (easy enough, I'm about as flexible as a plank of wood), attempt it until I feel the need to stop, then on release imagine the Sigil's image bursting into white light/flames in front of me. I'm definitely going to have to try the mirror method for Sigils now though. I feel like that weird blank slate of consciousness gets achieved quickly when jumping with the mirror method, so it might even beat the death posture for Sigils too. :)

Whatever works, I say. Although let's think of the trees. So long as we understand our purpose - which is basically to cease re-triggering our current state and thereby allow it to shift with intention unopposed - it's good. You can just lie down and give up completely and get much the same effect I'd suggest, but you have to give up control of your spatial attentional focus, not just your body and thoughts, and some people find it hard to get their head around that slippery idea. Fundamentally, all of this is a little like starting a new "world-dream" and just never coming back...

Q1: Fundamentally, all of this is a little like starting a new "world-dream" and just never coming back
Great analogy. I just posted something similar, a super short method where you visualize your ideal dimension, like watching a movie on a screen...and then you jump through the screen to permanently merge with the new dimension.

Yes. So, if what you truly are is basically an "imagination room" in which there are several "lines of thought" - well, jumping into a dimension is merely taking one such thought strand and making it your 3D-immersive one, by imagining that you are doing so while not imagining something else. There is nothing deeper going on behind the scenes than that; no real mechanism and no technique that isn't at root just a bit of "sensory theatre" for dramatic effect or self-persuasion. You are always just imagining-that something is happening or something is true. The trick is to find an imaginative path that logically implies the outcome you want to experience.

Yes, this is true. Kinda reminds me of this, only you're creating the images, not the TV...[<https://www.youtube.com/watch?v=wW0WRqnLYMw>]

You are taking on the shape of experiential states, really. Previous attempt to depict how we might choose to imagine a jump here [The Infinite Grid of All Possible Moments], but actually it doesn't matter what we choose; it what we've decided it means-that which is important. That's why it's creative and fun to play with.

Q1: That's why it's creative and fun to play with.
Indeed. Can you imagine if you were taught this as a kid? When I have kids, I'm totally teaching them this. It makes you realize how most adults have been living a lie when they abandoned their imagination, as they became older, in favor of being more "realistic."

Agreed. I think what happens usually is that we tend to unteach them this stuff. We lock them into a particular state. Denying them their ability to imagine, we also deny them the ability to intend, and that's the only power there is! No intending, no state-shifting, means full determinism - because actions don't help, only the assigned meaning of an action does, and intention is required for that. But, y'know, that's why the "DJ kids" will be great!

POST: Is time travel possible?

Initial thoughts - I think it's probably better to not frame this as "time travel" as such, because that comes with a lot of conceptual baggage. If instead we consider what we're experiencing right now to be like a "sensory dream" or a "strand of thought" of being-a-person-in-2016, then what you're aiming to do is start a new strand (of being-a-person-in-1996, say) and then never revert back to this one. This at least gives you a sense of what exactly it is you want to accomplish, and where you might begin. For starters, it involves completely releasing your attachment to this strand of experience. A few people have reported experimenting with this sort of thing, but not permanently (yet). Some people are taking it particularly seriously, albeit for different reasons than you: see here for example [POST: Perception, reality, time travel and temporal dysphoria].

Something that is helpful, I think, is to stop considering "universes" as things which are "happening" at the same time as your experience is happening. If you can embrace the notion that all that is ever "going on" is your actual experience - like you are scanning your attention across a static landscape of pre-existing sensory moments - then conceiving of this sort of change becomes simpler. What you are seeking to do, is to discontinuously move from "this moment", with the current facts implied by it, to "that moment". The rest would potentially take care of itself, just as when a dream begins. When a dream begins, if you are aware when it starts, what happens is: your body goes quiet, you get something like sparkles appearing in front of you, which turn into sensory fragments, which eventually coalesce into a scene, which then pops into being a 3D-immersive environment. From that moment on, all subsequent "moments" follow from that first scene, logically, without any direct intending on your part. It is also done by "autocompletion", in the sense that the first moment implies all the others. Since we are an undivided whole, like a metaphorical blanket of material, to define one part is to define the entirety, like how making a fold in a blanket inherently implies the shape of the rest of the blanket. Therefore, all you need seek is a single sensory 3D-immersive moment which implies-that you are back in 1996. It is hard to put this stuff into words, isn't it? It's like trying to talk about something that is "outside of thought", but using being able to use thoughts!

In the case of something huge (waking up in the past, in a different body, having missing limbs return, a different gender, etc), it would require you to in a sense believe you are that person already, then let reality force "rationalism" down your throat and insist that the previous moment was just a dream and you always were the new person.

In one sense, though, it's not really a "huge" jump - because you aren't going anywhere! You're not doing something you don't already do every night anyway; it's just that you're not going to be returning to this thread of experience. But it doesn't necessarily matter how you conceive of it, so long as you conceive of it in a way that has an internal logic to it. You could certainly go down the route of rationalising a large change in the way described so that you could accept it - while still retaining your current concept of what a "world" is. But equally, you could work on changing your concept of what "worlds" and "experiences" are more generally - effectively changing what "rational" means - and therefore have discontinuous changes make logical sense anyway. In other words, you can work on believing that you are "already that person", or you can work on believing that the nature of experience itself is different than you have been thinking up until now (which effectively involves realising that you are not actually any "person"). By taking the latter path, you are opening up all sorts of possibilities without having to go through the theatre of convincing yourself about individual things.

Perhaps then that is just a personal hang up of mine. Fear is a strong word, so maybe it is better to say that I am "concerned" with the idea of breaking the fundamental way I see reality. It seems to me that once you get over that hurdle then you've opened yourself to a more dreamlike reality, where anything goes. So at the very least, I know I couldn't do it the way your saying, because I'd be too afraid of breaking my sense of reality. To me its far easier to make changes that can be self-rationalized.

And that's totally fine. I guess the point is that **you can recognise you have a choice**, and you can go with the approach that feels right for you having deliberately selected it, rather than just having ended up with it by default.

POST: Color changes in the header?

Yes, is the short answer! Of course, just because there's a "plausible explanation" doesn't necessarily preclude there having been a change (since for the world to make sense, every change is coherent, meaning that subsequent experiences will support it, including those of encountering an apparent in-world reason for the change).

unless i start overtly creating a new world-view

That's one way - basically, **"reformatting" yourself with a different worldview**, and having subsequent experiences arise that are "as if" that were true. This is what Active Metaphors are about. The other way, is simply to repeatedly perform experiments such that the outcomes have accumulated so much that to dismiss the results as coincidence would be ridiculous.

POST: Will the latest 2 glass override previous ones?

You should consider each two glasses session as being a separate, independent operation. In other words, it's fine to do the exercise for one thing, and then another time, do it for another. Just make sure that each session is focused on a single intention, though; don't do batches. In the spirit of research (conducting experiments to see if there is anything to this whole thing or not), I'd generally leave a gap of about a week between sessions, to allow a bit of breathing space, and see what happens. And do remember to follow the final instruction for the exercise.

The final instruction being carry on with life?

That's the one! The idea is that the change has been made at the moment of the exercise - it becomes "true now that this happens then" - and there's no need to tinker with what has already been laid out, and indeed doing so excessively tends to counter-intend what you've just put in place. You might find some additional detail from a previous comment useful:

Something to note: there is a difference between writing out a description, say, and actually linking objects (mental or physical) to particular situations or patterns. So no matter what the format, be sure to actually ponder your current and target states, and let the words come from that contemplation, rather than just writing out something or working out the words to use intellectually. That way, the words will be "handles" onto those specific states, rather than simply unattached words that will trigger a more general extended pattern. Apart from that, as someone else mentioned, you are meant to do this once, then put the glasses away and carry on with your life. The change happens when you do the exercise - it becomes true now that things will happen then. Checking and tinkering afterwards tends to imply the initial pattern again, essentially re-intending the starting point, a bit like being in a standing position and confirming just how "standing" you are by sitting down again.

Basically, if you do feel moved to do something, then you follow your intuition and do it - but you don't need to worry about that or check whether there's something to do; it'll arise of its own accord if there is something. So don't even worry about whether to wait x months, or whether to do something or nothing - just leave the whole issue be. It'll take care of itself; you don't need to "work it out".

...Well, that's the trick: generally you can't "pre-know" your experience, because to know your experience is the experience of it! But in your everyday life, you already operate on the faith that your intentions are going to follow through by themselves anyway. Walking along the street depends on it, for example!

Anyway, as always you build up trust in an approach by trying it, and repeating it, until you find you can rely upon it. And after all, in many cases where you are applying this exercise, what's the alternative? It's not like there is another approach that would give you certainty. So why get hung up on being certain in advance with this approach?

You get the idea! :-)

So, treat this as a sort of experiment or an investigation - you do the exercise, and then later you see what the results are. That'll make it easier to let it happen. Good luck!

POST: Visualizing or manifesting feelings/emotions?

If you conceive of yourself as being literally an "imagination space", with the current world around you just being a particularly strong image unfolding within it, then things are a bit clearer. If that were the case, if you truly were an "imagination space", and you wanted a particular experience, how would you go about summoning it? Well, you'd sort of "overlay" or "refocus on" the desired experience versus the current image, as if it were actually happening, including the visual, auditory, textural and emotional aspects. You'd imagine-that it was true, here, now. Now, if you ponder how thinking works, it tends to happen associatively. That is, if you think "red car" then from that point your line of thought could go to any thought where "red car" is incorporated. Basically, from the infinite possibilities of all thoughts for ever, you have selected out a subset that contains "red car" imagery or ideas. The more refined your thought, the narrower the selection criteria, the more specific you are being - the more defined the pattern. And so it is with this. If you "picture" something then that selects out a certain subset of possibilities, the experiences within which that image appears. If you also "feel" something with that picture, then that further narrows the outcomes, to ones with that feeling. If you just do the feeling - say, feeling happy and lucky - then you select all possibilities where that feeling is a part of the experience. Viewing it as direct selection in this way, makes it clearer that you are doing something like associative filtering, rather than a hand-waving "request" or "programming" type operation.

Aside - Note that "visualisation" doesn't just mean a visual image (or it's not meant to just refer to that). It's a multi-sensory image. It includes sound, texture, and if you are visualising immersively (from the 1st-person, as if it were happening, being "clothed" in the image) then the emotional content and felt-meaning of the experience also. Unless you are doing symbolic operations, then that is what you want to aim for: you do not think-about images and feelings, rather you imagine-that they are happening here, now, as if you were overwriting your current scene with the target scene. You imagine-that you are experiencing a scene, but with the meta level where you know-that doing so means-that your outcome is being defined as a part of your world experience.

POST: No offence, but I think you're telling porkies...

When involving the free will of someone else, it has an effect on the outcome.

That's only really a problem, though, if you adhere to the assumption that "the world" is simply-shared, as a "single, shared, spatially-extended place unfolding in time", and that what you actually are is an "object" within such a place. This is not necessarily the case. In fact, it's one of the assumptions that some experimentation and contemplation might lead you to challenge.

The world is both separate and not separate. The truth is that this is no dichotomy. However, with being limited by the perception of being human, on the "surface", there is a type of separation, but the surface of things is also the connector of things. While it is correct to say we are all one, if the intention isn't of that, or of it is focused on a separation based thought, with love not being involved, only fear based want, then don't expect an outcome that is the best one for you in that moment.

I think we can be more focused about this. Namely, we might observe that our intentions often are constructed upon, and therefore continue to imply (are also intentions of), our assumptions or conceptual frameworks. That is, if we intend something in terms of a spatially-shared, temporally unfolding place, then in addition to our outcome, we also get a further entrenchment of that context.

*A1: Dimensional jumping, LOA, etc. Whatever you wanna call it...it's ultimately the same thing. You focus on a desire with a feeling of it absolutely done already in the present. And what you have you don't need. Gotta have that faith and conviction that it is DONE. So you have it DONE in your mind. Next step is to let go. It's all about playful curiosity and wonder. The same as a child would have. If you need or want it and approach it like that. All that you will get is more absense. Dimensional jumping is simply another way to approach this. **THIS NEVER FAILS.** However **your doubts and fears will prevent manifestation because it implies desperation and you will get more things in your reality that evoke further desperation.** Look into the work of Neville Goddard.*

POST: [Non-intentional jump?]My laptop screen was cracked..

We jump unintentionally all the time. [edit: Why is this downvoted. lol]

Although, if a jump requires an intention - that is, if "to intend" is equivalent to "to shift", and a "shift" is a re-patterning of oneself from one fully-defined deterministic sequence of moments to another - then it is, by definition, not possible to shift "unintentionally". Intention will always be involved in such a shift. (Here, "an intention" refers to a fact, outcome or pattern that is being brought into experience by increasing its contribution, and "intending" is the act of increasing that contribution. The result is a "shift" of state and hence deterministic path.)

Whether it is done knowingly and deliberately, though, is another matter. It is not necessarily the case that we have deliberately chosen a particular outcome; it may be a collateral result of (something that is implied by) another intention. I'd argue that many people, in fact, pretty much never intend deliberately. Some people may never intend at all, and largely run through their deterministic path without ever redirecting it in a meaningful way. (Of course, others may be regularly counter-intending against their present state as the corresponding moments arise - that is, resisting and thereby shifting against their own experience and prior intentions.)

So it might be better to say, "**most people, when they intend, do so without realising what they are doing, or even that they are doing it**".

I drive up to a drive-thru restaurant to eat. I want their "Terrific Burger"

Did you intend to have the "Terrific Burger" at that point, though, by making the decision to have it (if formulated as a fact rather than a mere possibility)? The sequence of moments could be a done deal before you even enter the drive-thru! Scenario B could be deemed an intentional outcome if so.

Scenario A: two realities exist at that moment one in which I will have cheese or one where I won't

We could say that **all possible scenarios exist always**. However, in any state then it is already the case that one particular sequence of moments is deterministically laid out. That's what will play out if you don't deliberately redirect (although you won't know what that is, until it does). The devil's in the details, though. If one "intends to go to the drive-thru and order a burger and ask for cheese", then that is different to "intending to go the the drive-thru and have a cheese burger". One defines an act as a fact (with the possibility of cheese), one defines an outcome as a fact (cheese burger will happen).

Both shape their reality, one is just purposeful and with meaning, the other is passively accepted as being what it is ...

What we were talking about, though, was the idea that people are "jumping all the time". In the latter case, the person isn't "jumping" (that is, redirecting their ongoing experience) at all. They aren't "shaping" anything; they are remaining in whatever "shape" they are in. And actually, even in the former case they might not be...

We should note, here, that having the sensory experience of apparently thinking or deciding or performing actions is not the same as intending/reshaping/shifting your state to incorporate a particular outcome or fact. One could experience "the act of ordering cheese" and there be no intention at all involved in this; it can simply play out as a sequence of moments already defined as one's state. "Shifting" involves updating the facts of the world (and therefore the sequence of moments one will experience), and is not an action as such (since it is "before" that, although action might be used as a "handle" onto an change). That's why I think the idea of "we are jumping every xx fractions of a second" isn't much use, since it conflates the concept of "moments" with the concept of "dimensions", and makes "intention" (or "shifting state") meaningless, potentially.

Yet they are but they just didn't know that their failure of intent and choice led them to their consequent result but you know they jumped because prior to receiving the 'Terrific Burger' they did not have a burger to receive. The new dimensional state is different from the previous dimensional state.

This makes it seem as though "not having a burger" and later "having a burger" is a sign of a state change in and of itself, but that is not the sense in which one is in a "state". A state is not an inventory, or a set of facts of the moment. Rather, it is the definition of your entire path of experience - all moments. It is the full definition of the world (or "world-pattern", to keep things suitably abstract). So, at the moment before our friend goes into the drive-thu, he is in a particular state - or rather, the moment is part of a particular state - and he will remain in that state eternally, unless he intends a change. At that moment it is "true now that he will receive a burger then". A state is "outside of time" or "before" time (in fact, "time passing" could be said to be a particular static pattern that is a component of a state) and since moments are aspects of states, it doesn't make sense to use events as indicators of state shifts (unless they were done knowingly and deliberately - perhaps). In other words, "receiving the burger" is an aspect of a particular state, and it was true from the point of his last intention/shift onwards. And this last intention may have been a long time ago, about something completely different (e.g. "it is true now that I win this game of golf then"), with "receiving the burger" just happening to be a fact in the resulting state, as collateral outcome or implication. If he does deliberately intend the specific outcome of "receiving the burger", then that could be seen as a shift - or perhaps better phrased, an assertion of a particular fact in order to guarantee its presence within his state.

It is not a situation of 'I tried and it didn't succeed' but rather 'I didn't know I could and now I can guide my success'.

This, I think is fine. The recognition of one's ability to update the facts-of-the-world and have their experience correspond to a new setup from this moment onwards, is ultimately the most important thing. The structure of a conceptual framework is secondary.

Q: *This makes it seem as though "not having a burger" and later "having a burger" is a sign of a state change, but that is not the sense in which one is in a "state".*

Right, that is why this was just a metaphor of how the concept works and not the literal concept. lol.

This, I think is fine. The recognition of one's ability to update the facts-of-the-world and have their experience correspond to a new setup from this moment onwards, is ultimately the most important thing. The structure of a conceptual framework is secondary.

Which is / was the point. :D You are jumping dimensions anyway so why not intend what jumps you want to make instead of unintentionally jumping to a reality you never desired in the first place.

Yeah... but if it's not a self-consistent illustration of the concept of "dimensions", then there's not much point in having a metaphor ("ordering at a drive-thru") of another metaphor ("dimensional jumping"). Of course, this stuff can get tangly pretty quickly anyway!

Ultimately, there is nothing really "behind" descriptions such as "law of attraction" and "dimensional jumping" - they are never "what is really happening" because there isn't anything behind the scenes, as it were - but I do think they can be useful for formulating intentions, and thereby asserting a pattern onto experience (i.e. defining a state). The problem is, I think, that a lot of descriptions don't actually give a stable platform from which to make the change ("law of attraction" particularly), whereas I think if you follow the "dimensions==states" concept carefully to its end, you get a very good context to use which isn't entangled with content. That's why keeping the "state" concept as the base structure is fairly important (to that description), because otherwise it becomes yet another unfocused "wishing" structure like LOA.

Q: *whereas I think if you follow the "dimensions states" concept carefully to its end, you get a very good context to use which isn't entangled with content.==*

Right. Just like there are audio learners, visual learners, audio/visual learners, and kinetic learners, I believe that explaining it only one way disadvantages others who, by nature, understand things differently because it is how they are wired. So, one way of understanding makes you feel good and understand the concept, might alienate the other 75% who don't see it in that same light.

As I touch on in the other comment (we've bifurcated!), though, what I have in mind here is maintaining coherence so that there is a model that can be understood at a detailed level, and therefore used as a framework. "Dimensional jumping" is just a name - it can't be understood in and of itself. It's the description that it is the name of that can be understood. If that description just amounts to "hey we're always jumping dimensions so let's choose nice ones", then the model actually has no content. It's back to "wishing" and "feeling" again, LOA-style; you can't really build on it. (For instance, the formulation of the two glasses exercise doesn't follow from such a vague notion.)

Like you said, the two glasses exercise doesn't follow from a vague notion, but at the same time I figured out how to jump without the two glasses exercise simply because I knew how it could be accomplished without it.

Indeed, the two glasses exercise is constructed to leverage a pre-existing pattern of the world. However, no component of the exercise is the "cause" of the change as such - a neither are you, the apparent performer of the exercise (in the sense of you-as-person). The main purpose of the exercise is really to produce an experience which becomes the starting point for further contemplation and experimentation.

Like I said in a previous discussion: "As people experiment with different methods, these too are just examples of how other people achieved their desired outcome and not necessarily the reason or cause of the outcome."

Yes, all apparent outcomes are really examples of experiences. Ultimately, if one pursues this, the very idea that there is a "how it works" falls under suspicion, and all experiential content - including the experience of apparently "doing" or "causing" something - is seen as results rather than causes. The cause is sort of "before" experience, if it can strictly speaking be called a "cause" at all.

Yet, my understanding of what happened too is not necessarily the reason or cause of the outcome.

I think one comes to recognise that "understanding" is not, in fact, a description of "how things are", but rather a pattern one can adopt or impose upon oneself, in order to have experiences "as if" it were true. You can't actually understand (that is, think of conceptually or discuss in language) the "nature of experiencing", because understanding is itself an experience, and as such cannot get "behind" the primary strand of experience (of apparently being-a-person-in-a-world, typically). You don't explain these experiences in terms of causal mechanisms, because there is no mechanism behind (or anything else) them. All you can do is create "parallel constructions in thought" which may or may not be useful when it comes to patterning one's experience (that is, imposing particular patterns or facts upon one's state) in future.

Which is / was the point. :D You are jumping dimensions anyway so why not intend what jumps you want to make instead of unintentionally jumping to a reality you never desired in the first place.

I do get why you like the idea of "hey you're jumping anyway so why not make it count" - that's fine. It was more the "jumping xx times per second" idea which I think goes too far, creates conceptual problems when it comes to designing a good thinking framework for formulating intentions.

Note, though, that what I have in mind isn't just "intending for outcomes in situations" here, but actually intending modifications to the "formatting" of our ongoing experience. It's that extra bit that's the motivation for being a bit more careful on this.

I believe we are saying the same thing. :D

Heh, quite possibly so, such is the way of these discussions!

POST: My personal experience with the two cups method

Could you give some tips on how to "carry on with life" after doing the exercise? I recently did the exercise but I can't stop thinking about it.

Passing thoughts are fine. You don't need to "solve" those. Treat them like they were an itchy elbow or something - your attention is briefly drawn to them, then you carry on with what you are doing. You wouldn't obsessively focus on a passing twinge or itch on your skin, so why would you pause and focus on a passing thought? They're both just passing sensory imagery, and equally unimportant. Some people don't actually realise they can choose to not bother thinking about something, to do something else instead - they assume they have to complete the line of thought before they can move on, as if thoughts were always special and meaningful. This isn't the case. It's optional. By deliberately attending to a thought, you are choosing to make that pattern more dominant, and a doubtful thought or a worry means a "doubtful outcome" pattern. A passing thought is just a possibility, an aspect of your state, flickering briefly into the senses. Focusing on a thought, though, is an increase in its contribution. So leave them be. There's a book, non-esoteric, called Stop Thinking Start Living by Richard Carlson, which is quite a good read for people stuck on this in life generally.

POST: more feedback on my jump

Q: *Is it in poor taste or rude to ask for proof in this sub? Only because paychecks would be pretty good proof, and fairly easily shown? Beyond strange, happening upon those cards reminds me of finding drawings in my sketchbook I can't remember drawing, but so much more intriguing...*

It wouldn't really prove anything, though, I suggest? Someone could easily, upon receiving a pay rise, just say that they'd intended for it beforehand. Also, I think, it perhaps misses the point. That is, that the only way to truly satisfy yourself whether there's something to this (or not), is to conduct your own experiments and observe the results. Other people's stories are, to an extent, irrelevant except as an inspiration to check things out ourselves, or maybe provide different ways of approaching the "investigation". Meanwhile, the "meaningfulness" of an outcome tends to be quite personal I'd say (meaning that it's hard to convey the impact getting a result has, because a surface-level description just sounds like a coincidence, and it's the larger context of the situation which tends to make it - occasionally - astonishing or disruptive of one's usual perspective). To an outside observer, they often seem kinda irrelevant or unlikely or mistaken.

Q: *Sure, like any "proof" of that nature it's not worth much on its own, but I suppose occaisional attempts at giving some sort of evidence would make skeptical people more inclined to believe, or at least give this sub an appearance of something more than just storytelling- and this seemed much more "provable" than some others. It was a genuine question, and it seems that it /is/ a bit poor etiquette, so my apologies.*

It's a completely fair question for you to ask: is there value in requesting evidence that a story happened?

If the overall project was to document instances of an objective phenomenon, then there could well be value in it. However, ultimately the underlying topic here is "the nature of experiencing", so in the end it's always down to personal exploration - and then sharing your stories and thoughts in order to inspire others or gain their insight. I think we have to mostly go with the notion that the posts themselves are trustworthy (as per Rule #1) because there's no real way to prove authenticity of the report overall, only (irrelevant) elements of it. Or, rather, we should keep an "open verdict" until we conduct our own experiments and see results for ourselves (or not, of course). It's actually okay that the sub has an appearance of storytelling, because the sub isn't trying to persuade anyone of anything. The guidelines specifically suggest that you shouldn't "believe" anything here (or anywhere else, for that matter), until you've looked into it properly yourself. You (probably) can't prove "dimensional jumping" itself (to others), any more than you can prove that you are aware.

...

No, I disagree. This isn't about "believing" as such (although, for sure, if we define "belief" carefully, when can connect it somewhat to a broader idea of "patterning" experience). You do not need to "believe" in the owls or two glasses exercise in order to get results - at all. In fact, the exercises deliberately omit the underlying thinking upon which they are constructed, so it's hard to believe in them as mechanisms at least, even if you want to.

...Not even that? What does matter, though - and this is where a specific idea of "belief" comes in - is that you don't interfere or counter-intend subsequently. That is, you don't allow doubt to cause you to tinker with your state, and perhaps pattern yourself with the idea that things cannot or unlikely to happen. This is a "non-thing", though, rather than a "pro-thing". So it is better to neither believe nor disbelieve, and instead just do the thing, and then "carry on with your life"!

POST: OCD making me visualise really bad things - will they come true?

Don't worry about them (easier said than done, I suppose). Passing thoughts are just that: passing. The aren't causal. It's not the same as sitting down and focusing on an image with intention. Don't try to wrestle with them; you don't need to "solve" those thoughts and images; just let them be. It's actually the wrestling or solving that is the issue. (Fighting the images basically persists them - that is, fighting something implies that there is something to fight, further narrows your attention upon it.)

You could consider a thought to be like an artefact on the overall infinite static landscape of experience: sure, you can stare at that tree forever and worry about it falling in the woods, or you just look elsewhere (or "carry on with your life", as the final instruction in two glasses says). It is your choice to continue to engage with the thought, even though you might not realise this; you can choose to leave them alone. This is easier to recognise if you can put the thought in context, for example by doing the Feeling Out exercise quoted in this comment. You might find this essay on OCD [missing] an interesting and useful read, and also these books for the perspectives they offer: Richard Carlson's Stop Thinking Start Living, and David K Reynold's Constructive Living.

so if I'm understanding correctly, without intent these thoughts won't happen

Right. A passing thought is just that: a passing image across your "screen" of experience, just like any other passing sensory fragment. Images are not themselves causal; intention is the only true cause. It can be useful to distinguish, perhaps, between "passing thoughts" and "active thoughts". In the active case, one is deliberately summoning and focusing on an image with the intention (or implied intention) that doing so means-that the content of the image will later arise in daily life. In the passive case, it's like having, I dunno, an itchy elbow or something. If you have an itchy elbow, do you stop everything you are doing and focus on that itch, worry about its meaning for the future of your elbow, spend the rest of the day returning to check your elbow sensations for signs of itching? Of course not! You scratch it, move on, if it remains ticklish, you just go "oh okay" and get back to work anyway. If you want, if it's the same thought again and again, you can experiment with the equivalent of "scratching the itch". After all, that thought is just an image - that is, a visual, auditory, motion, textural composite image, which is made from you. You can alter its properties, in fact, and thereby change its "intrusiveness". For example, you might play with reducing the visual brightness, making the image black and white, adding or removing a frame around the image, making it a still image (if it's a moving one), changing its distance from you, changing the image size, make it silent, and so on. Try each property and see what effect it has on how impactful the thought is. Do this just for fun, even, to find out more about what makes a thought or image have an emotional intensity or not. However, in this particular case, it's really just easier to just-decide that it doesn't matter and then return to whatever actually needs doing in the moment, now, in your life.

...

Q: ?!#&/!

Please ignore that reply; it's really not appropriate for what you are describing. You really have no need to worry at all about this. (No disrespect to the commenter, I just think it's important not to be too casual about advice in this specific sort of situation, because it can easily spiral.)

POST: I don't know what to say.

[POST]

My life is in shambles. I wont get into the specifics of it. I love my SO, but our life is falling apart. I've been reading this sub almost obsessively for the past week. Not that I am looking for a "miracle cure", but I felt hopeless. For every step forward we were launched a mile back. I kept toying with the idea, but Im never up between midnight and 3 am. Even then my bathroom mirror isn't that big, I dont have candles, blah blah blah. I read the post (or link, I dont rightly remember) about laying on the floor, head slightly elevated with feet on the ground and to just....be.

So I laid on my bed today. (I used the bed because we have family living with us and the living room floor would have been an odd choice and I would have been asked if I finally snapped.) I am just done with life (not suicidal, just needed to check out for a bit). I turned my tv off, put unplugged headphones on and just tried to melt away. As I laid there, I tried to imagine myself in a white luminescent room (sorry if I spelled that wrong). I didnt so much say to myself as just try to feel it "Body, Im done. If you want to get up and go, get up and go". If I got fixated on a thought, I wiped it away. I continuously went back to the white room. If thoughts did come through that were negative, I turned them to positives before I wiped them away. At one point, I either fell asleep or legitimately let go (my vote is for let go). I felt as though my body started to lift my head up and then my consciousness realized what was happening and slammed me back into my brain. Thats the only way to describe it. My heart was pounding and my mouth was so dry. So I calmed myself. Went back to my good thoughts (usually trying to turn a negative thought or emotion to a good one involving money, since that would fix a LOT of my problems right now), and back to my white room. This same feeling happened 2 more times. Where I felt like my body was just going to do what it was going to do and I was just an outsider watching until I was slammed back into my brain. I dont know what to make of this. It both excites me and scares me. It wasnt normal. Ive meditated before and this is nothing like what Im used to. I feel stupid and silly sharing this. I feel like an irrational person using psuedo-science to rationalize my feelings of lost-ness. But I am literally at the end of my rope. Im not hoping for miracles.... just enough change to make it in life and be genuinely happy. I am going to continue to do this every day. Maybe there is something to this dimensions thing.

Edit: I wrote this right after I came back to "reality" (meaning I sat up, turned the TV back on, listened to my SO's family fighting in the other room, etc etc etc) and as I sit here... I have a massive headache and I feel nauseous and kind of... out of it. This has never happened in other meditation sessions Ive done. I dont know what to make of any of this. Ideas? Conjectures? Theories?

[END OF POST]

Well, that sounds quite fun. (You were doing a 'daily releasing exercise' with the 'imagination room' or a variation, sounds like?)

And your later experience is the beginning of an OBE/lucid dream. You detached and shifted your attention away from your sensory surroundings and your experience followed through. Next time you try it, don't worry - have the confidence to let go more completely, to just allow whatever happens to happen, and you'll have some interesting experiences. If you're not familiar with lucid dreaming, check out Robbert Waggoner's Lucid Dreaming book. If you've not heard of OBEs, Donald DeGracia's free class notes are worth a read. The hypnagogia technique described is similar to what you accidentally did. Don't worry about "evil spirits". A good quote from DeGracia:

Sepherial went on to explain how it's really important to realize that fear is something we create in our own minds and that if we are to get involved in [these] things, we must learn NOT to fear things anymore. You can replace fear with understanding. When you understand something, you no longer need to fear it. If it is truly a dangerous thing, but you understand it, you will not fear it, you will avoid and respect it. And there are other things we fear that, in reality, are not dangerous things. These are the worst kinds of fear [...] to have. These are fears you have created in your own mind, for whatever reasons. These fears are like weeds that grow in the garden of your mind, and you should eliminate these.

-- do_obc class notes, Donald DeGracia

Q1: I have not read of lucid dreaming (I have heard of it, though). I will definitely have to read this book and read up on this, thank you!

It's great. You can have this life and a radically different parallel life (or lives) in dreams as well. Much fun!

...

Have you ever encountered an evil spirit? You can certainly summon demons into your life but... they are you. In these things, you bring a lot of your own beliefs and fears into it. That's why the 'transition point' can be very frightening. But really... treat it like lucid dreaming, access to the larger realms of mind. I've never known anyone had have any problems.

I honestly believe they are real, external things.

That may be the problem! ;-) Joking aside, you can certainly have experiences of apparently independent forms, but I wouldn't view them as external except in a notional sense. The main point is, nobody should allow fear of that to prevent them doing AP/etc. If you encounter things you are uncomfortable with then, just as in waking life, you give them a wide berth. (I suggest.)

If you can! I actually always wanted to do AP growing up, but was terrified of doing so because our house was haunted as fuck. I'd be open to trying it again now that I've moved out, I dunno.

Really, just do it. You seem to be imagining that you are some powerless dot that is at the mercy of anything that happens by. Really not. The best way to dispel your fears is to read accounts by people who have explored it thoroughly: Donald DeGracia as mentioned, Robert Monroe, Oliver Fox. There are many reasons to choose to interpret your experiences as "part of you" and to accept the fear as fear of aspects of yourself. This applies to dreams, OBEs, and waking life (which are the same really). If you occasionally have a startling experience, it'll be no worse than having an intense dream - only you'll be conscious and able to manage it accordingly. Are you scared of going to sleep at night? ;-)

POST: Jumping ship?

What happens to a memory when you aren't recalling it?

What happens to your name when nobody is calling it?

That sort of thing.

A "dimension" isn't a place so much as an experience that you're having.

Q1: But where do "I" come from? How did the collection of experiences that is me start?

A very good question, and there are various ways to approach it. The simplest is: a hypnogogia type process in which random sparkles became patterns, shapes, images, a scene, and finally a full-blown environment, apparently centred around a certain perspective. You-as-consciousness, an open aware space, were always there. However, the world-pattern that is arising within you now, the content of your experience, was formed as a sensory dream. That includes the basic formatting of time and space. **This is The Forever-Now World.**

POST: Questions! I don't have anything holding me to a dimension, I want to see how far away from this reality I can get.

But there is nobody to accept you just the way you are, except for yourself...

Perhaps to get to a universe (state) where you have reached self-acceptance and therefore the experience of others accepting you. Oh, and have cool things.

Anyway, wait, why am I listening to you? You're not even real!

Sha-la-la-la I can't hear you!

[puts fingers in ears] . . .

;-)

EDIT: Of course, maybe you enjoy the thrill of the fight and overcoming (apparent) adversity.

POST: How to shift universes by Bashar

Hi, if you're going to post a link can you include text with your own discussion and experiences? There's no point in this place becoming yet another Bashar link fest. Thanks!

I've never seen any Bashar links here, hence why I posted it. There seems to be a fundamental misunderstanding how parallel universes work and how to shift here.

Bashar, fun though he is, is just one of hundred of different versions of the same underlying idea - which is essentially that there are different patterned experiences available, which individual private views can select amongst. Parallel universes aren't "places".

(You can even channel your own version if you like: sit in front of a computer, type "How does reality really work?", get comfortable and relaxed and then - whenever you feel ready - just start typing out your answer without thinking about it in advance.)

Hmm, how about you give me a quick summary (two paragraphs) of how you think parallel universes work and how to shift, based on Bashar's output?

Q1: Well, that's just it, you've perfectly illustrated that you don't understand parallel universes. Forget about bashar for the moment just look at quantum physics. Every out come/choice is its own real universe. Bells theorem shows the observer creates their universe by observation. So you are just one version of infinite versions of you that all exist. Shifting to another parallel reality happens all the time, it's by your conscious higher self controlled by emotions, thoughts, frequency, beliefs, vibration and visualisation that decides which universe you shift to. There is a recent book called the afterlife of billy fingers, where he explains how everything is recorded in the Akashic records, and you can sift through all the decisions/actions in your life and see what happened if you made a different choice, they are played out and recorded for real. That's how the law of attraction works. It's a physical law, there simply are infinite number of universes of you. It's all holographic you see, it's not real, like a computer running millions of versions of gta at once. That computer is God, as God wants to experience everything. You are just a tiny piece of God running In a simulation. I suggest you take some LSD to find out. Better still die. You can by accident thus having a NDE. Or just leave your body by means of an out of body experience OBE by astral projection. Once you aren't in your physical,body and outside of the hologram you can see this really clearly. So until you take the red pill, reality is exactly what you fool yourself or believe it to be. Clever eh?

Okay, you should forget about quantum physics: Quantum physics is a mathematical theory used to create a description of available energy states and their probabilities in certain narrowly-defined situations. It does not involve creating parallel universes; that's an interpretative fiction which although fine for fun, isn't scientific, since there can never be evidence for it.

(Recommended reading: George Ellis on MWI and the like; N. David Mermin on reification of concepts; Christopher Fuchs on QBism.)

And also forget about "infinite versions of you", because to pursue that notion you will have to work out what a "you" is and how there can be multiple versions. Really there is only one you: the subjective conscious perspective in which experiences arise. The world is not a "spatially-extended place, unfolding in time" and you are not a person in it. Rather, you are a conscious perspective having a being-a-person-in-a-world experience. Which is what allows you to change that experience using intention. There is no fixed underlying substrate. What you are doing, it seems, is confusing one particular metaphor (many worlds imagery, computer simulation imagery) for "how it is really". But the thing is, there is no "how it is really", except for consciousness taking on the shape of experiences. From the sidebar, you'll notice that both The Hall of Records and The Infinite Grid are basically versions of the same idea that 'Akashic records' is based on: that all possible experiences are available, and that one can select one's trajectory through them. Have you read any of the "related posts" as listed in the sticky post? Particularly useful are this one (plus links) for establishing your personal perspective, and maybe this one to give yourself a good metaphor for direct experience. If you don't even have the understanding of what "you" are sorted, then everything else is meaningless and immediately wrong. Parallel universes are metaphors; experiences are like an ongoing dream that never ends. You are never "in" your physical body in the first place.

So until you take the red pill, reality is exactly what you fool yourself or believe it to be.

Exactly right! And that includes any concepts of personhood and the structure of "the world" or "the universe". This is why we talk in terms of "active metaphors" here: the adoption of a metaphor shapes the experiences you have. The short version:

"However you imagine that it works, That's how it works." -- The rule of metaphor

Right now, you probably believe yourself to be something like a conscious soul that is in a place, believe that the world is a "place" made from parts and unfolds in time, and believe that events happen and that actions are performed. None are correct. All good fun!

[COMMENT]

Q1: You are confusing "remote viewing" with " parallel worlds ". Time doesn't exist, and the world you sense is a holographic illusion. Parallel world are a real thing, not some imaginary construct. If you want to really know the truth, you have to leave your physical body and the 3d dimension illusion. In order to do this you have to either :

1. Die, that is have a NDE, near death experience.
2. Take red pill, that is enthogens like LSD, DMT, Aya, shrooms.
3. OBE, astral projection, out of body experience.
All of the above will take you out of the physical dimension, for real. Until you grow the balls to really leave this dimension, you are simply living in an holographic illusion. But I really don't think you are smart enough to discover the real truth for yourself by real practical experience. Think about it, wouldn't you rather know for real ?

[END OF COMMENT]

Sigh. There is no physical dimension. Don't you get it? That's the whole point. There are no physical places. **Everything other than your conscious perspective, that open structureless aware space, is an imaginary construct. Everything.** Any discoveries you make are just... more dream. Your current experience right now is in effect a remote viewing "from nowhere", an immersive thought about being a person in a world. You are never anywhere, in fact. You can't leave a dimension, because you aren't ever in one. However, you can use the concept as a nice way to change your experience dramatically and discontinuously. I've done the tour - but really you don't need to. And in fact people who do often get the wrong idea, because they view their everyday world as a stable platform and the mystical as some special state (they think they leave bodies, see infinity, etc, instead of realising they were never in one, and infinity is in the room right now).

The reality is: there are no fundamental facts. All content is arbitrary.

I have a feeling you've never really directly changed your world...

I'm not mocking any experiences you've had which have helped you; if you've benefited from them then that's great. But remember, they're just... more experiences, more dream.

Q1: You are really not getting this. I already said many times reality is a holographic illusion, it's not real. This is really ultra basic spiritually 101. You can leave this holographic illusion. More specially this lower frequency vibration 3d reality hangs on. Now instead of talking bollocks all your life, why don't you take the real red pill and find out? What are you so scared taking LSD will shatter your completely wrong view of reality ? Surely you should take it, just to prove to yourself all your false assumptions are correct ? Really what are you scared of ?

No, I think you're not getting it. But maybe we're just using different ways of talking about it. So:

- Tell me what you mean when you say "reality" and what you mean by it being a hologram?
- And then: what exactly do you think you are? Do you think you are a person, in a location?
- And then: what do you think taking a chemical does? Does it affect "your brain"?

[Transcriptor note: He never answered...]

POST: Can't Jump? Dimensional Jumping from a Skeptical Perspective.

The easiest approach is to do something minor, just to test the water. Belief itself isn't really the problem - except that it prevents someone from trying things out, or they keep tinkering with things they've already done. The process of change itself is "dumb, automatic, mechanical". The hardest bit is getting yourself to actually do anything in the first place. The simplest ones are, in the spirit of just having fun:

- Create a synchronicity involving the owls. Basically, sit down for five minutes and imagine an owl in the space in front of you, with the intention that your life is going to be filled with owls from this point onwards. That's it. Since there's nothing at stake, there's nothing to worry about.
- Try the situation shifting experiment. This has the benefit of involving no commitment at all in terms of belief or indeed effort. Provided you have running water and somewhere to put it, you're sorted.

The purpose of doing these is to demonstrate to yourself that there is indeed "something going on". After that you can get more focused - although once you've witnessed results, you can probably think of ways to adapt even these simple ideas to your advantage.

POST: Not getting results...

Just "play dead". Don't worry about how or what. Don't bother tinkering with your thoughts, or try to suppress them. The way to think of this is:

- Performing the act is a direct manipulation of the world.

Once you've performed the intentional act, "your work is done". You can just go about your life. And the results will show up in time. You might imagine the world as a landscape that you are traversing. As you walk across the terrain, only a small section of it is unfolded into 3D-sensory experience; the rest of it is present but dissolved into the background. Despite this, intentional acts operate on the whole landscape, instantly. So your change has already been made, there's nothing more to be done - you just haven't reached that part of the landscape yet. When you perform the intentional act, you will quite likely note a shift in your background felt-sense (that sort of 'global summary' feeling), but actual confirming experiences will appear later. The important thing is to resist constantly, intentionally tinkering about with the landscape (mentally or physically) on the assumption that nothing has happened, because you will be reshaping it again!

Main points -

- **Don't overcomplicate things.** It's tempting to want to "do more" than just doing the imagining (the owls) or pouring the water (the glasses exercise), to somehow make things happen. But this is before action. Trying hard is an experience; trying hard is not causal. Just decide what the act means, then perform the act.
- Do it then forget about it - but in the sense of not picking at a wound, rather than you actually attempting to prevent thoughts and memories.

POST: Do you think dimensional jumping can explain something like reincarnation?

If the rule is that "experience always continues" then, yes, in the sense that when you run out of "plausible moments" in whatever trajectory you are on now - a discontinuous jump would happen. A "rebirth" in the sense that you would no longer experience being-this-person-in-this-world, but would still have an experience of some sort. Over at the Glitch subreddit there are lots of stories of people having a crash and it being "reset" to before, with memory, or suddenly a switch so it doesn't happen. If it did happen though, then your other next moment options could be a reset without memory, a new person with or without memory (at birth or after), or some sort of non-Earth type experience. What you actually get (assuming you haven't planned ahead) might be a composite of whatever patterns you have accumulated at that stage (I suggest). After the dream... more dream.

Aside: The Buddhist idea of preparing for bardo sounds quite a lot like our ideas of releasing accumulated patterns and intending states.

...

...I guess that's one reason to give this some attention, sooner. Who knows how many times you've already been through it. (Maybe you've even "been" me one time.)

One thought: how long would it be before you'd maybe choose to forget again?

...A really good analysis. So, I'm inclined to think you'll go along a while, enjoying not being afraid, getting what you want. But: Eternity is a long time. And since you now know that suffering is an illusion - that there's nothing to worry about really, because you are never a person - you might go, well, I'm bored, it's time for another adventure, and an adventure means the stakes must seem real...

This probably (definitely: since you are here, now) means that you will always "eventually" choose to forget, at least "temporarily". However, you might be able to set some things up in advance to help your newly-ignorant manifestation have an okay time - some basic patterning, maybe - provided they don't resist it and do listen to their intuition...

...Maybe you'd choose to wake up in North Korea, as a bit of a challenge? After all, you know that at the end of it, it won't have mattered, because all you were doing was browsing through the Hall of Records. There was no danger of a final sort. The good thing about life, is that it's definitely temporary? Ahem. But yes, lots to ponder.

Nothing matters, but we need to hold on to the thoughts that it does or experiencing itself becomes meaningless, then we would become "prisoners of the dream".

So, forgetting it means adventure but fear... and eventual exhaustion, then remembering it. Remembering it means safety and comfort... but eventually boredom, then forgetting it. Seems like a cycle is the ideal solution, or a bit of adventuring between the bliss.

maybe that's how it's supposed to be by "default"

I don't think there is any intended default. Or rather, any default must have been a "decision" you made previously, implicitly or explicitly. Any "meant to be" must have been triggered by us at some point.

Like using the law of attraction, not questioning the underlying structures?

Well, I meant more that after you've sussed it out, you could perhaps embed a pattern such that you will forget - and then remember. A "memory worm"? Since patterns are triggered associatively, you could link it to a pattern than can only come into experience when not-being-a-person. But then, this is theoretical fun really. There's nothing beyond what we're experiencing now, but who knows what is dissolved into it? (Well the answer is: everything, potentially.)

the experience of being a human seems to come with the pattern of limited lifetime by default

I see what you mean. Yes, I've been thinking about this lately. Although I suppose our actual experience is one of being-a-world-viewed-from-the-perspective-of-one-human. The limited lifetime is part of the definition of the world-pattern.

I guess we will never find out, as free as we feel we're still caged for eternity on a big scale

Well, I'm not sure we're caged at all; it's sort of the opposite, right? All possible patterns are within us. Our human-patterned limitation is that we cannot experience as unfolded everything at once, as 3D-sensory experience. Our overall limitation is that we cannot cease, because we are eternal and undivided. In other words, our final limitation is that we are unlimited.

the ability of analysing, interpreting and understanding your experiences (intelligence) seems to fall into this too.

At a more subtle level, yes, good point. The ability to identify with one part of the pattern and manipulate other parts, even though actually you are shifting shape as a whole.

it's disappointing, that finding out what's behind consciousness is impossible.

We are disappointed that there is no behind, I guess. One of the issues human thought has, is that it cannot capture this, because thought is a form of this. In truth, there is not even consciousness, since it is everything. It's really just a way of saying that the forms we encounter have no fundamental existence, they are all the same thing, but that thing is that which takes on form. **If everything is you, then nothing is "you" because there is no other thing to contrast it with, meaning that it's not even a thing.**

Well, that's nice and clear, isn't it? :-)

...I think that the intellectual exploration helps us strategise - gives us a framework for discussion. It also helps us format our experience, because thinking is itself the triggering of patterns (hence "active metaphors"). But really we have to attend to direct experience to fully get it. It's then very obvious that you are unbounded consciousness in the shape of an experience. What can be difficult at first is the ironic sense of claustrophobia: that you can't get away from yourself-as-the-world, since everything you think-intend-assert-attend to is a literal shift of the world. If you re-identify with the background space as your viewpoint, though, this sorts that out. You basically choose to identify as a "container" and therefore you can intend without "standing on" any part of experience.

If I would be truly convincend that the world is a computer simulation it would behave as such.

Right!

There is no definite truth, and you have to take on some shape. The worldview you adopt becomes the basic formatting for your experiences, implicitly defining the "plausible paths" for your intentions to shine through into sensory moments. Here, in this subreddit, we assert our formatting knowingly and deliberately - which means it's all about finding the least complex, most flexible description, realising that it will shape our experience accordingly. That's why I suggest metaphors like The Imagination Room. They give you a "place" to be as the experiencer - you are the unbounded background - without interfering with the potential experiences available to you, or opposing intentional shifts.

POST: Anxious and scared to jump

Why don't you take one thing at a time? What's the rush? If you'd never heard of this subreddit, you'd likely just be stuck with handling it normally anyway. So get comfortable with the idea first maybe. If you browse the sticky post you'll find non-mirror approaches, as well as other background info. You might just create some owls and do the Two Glasses Exercise initially, as a demonstration for yourself. Then: the most direct method is to repattern yourself using detachment + imagination + intention. Check out The Patterning of Experience or the Neville Goddard post for some information on that. It makes sense to read through the other key posts and get familiar with things before pursuing that too far though, I'd say.

...

Good description. Another thing to note - the "collateral shifts" might not always make logical sense, at least not in a way that's obvious (it might be associatively linked but not factually linked). If you adjust the fold called "my ranking" then it pulls on the rest of the sheet, as you say. But the sheet isn't arranged spatially like the world is, with related objects all beside one another. For example - when you change the "my ranking" fold, one of the folds it pulls on might be the "total number of tinned peaches in my cupboard" fold.

Thats what I'm most worried about. I've been sitting this entire day contemplating what can happen if I go through with my jump. Also is the two glasses method still in form of dimensional jumping, so will I see my universe Id change?

I'm going to suggest you look at it this way: Everyone has their own copy of the universe, a "private view" that contains their own "set of facts". All that ever changes is the stuff in your universe, what's different is the extent of the change. I'd scale it like this:

- conf. bias > coincidence > synchronicity > "manifestation" > shifting > "jumping"

The glasses exercise sits at the level of synchronicity and manifestation. From your perspective, it will seem that things are happening to help you along the way, like lucky events and odd changes, but it will be like an "accelerated" process. Really, don't worry and just try it out and see what happens. Your world is changing all the time in the direction of your intentions anyway, this is just a way of shifting it more quickly. Imagine if tonight you went to sleep and during the night one year passed in the space of eight hours - it would seem that you had "jumped dimensions", right? Think of it like that.

I just did it. How long does it take to see the change?

Wait and see. Top tip: remember that your body is part of the world too. If you feel "drawn" to doing something, just let your intuition move you. And follow the last instruction: "carry on with your life", don't dwell on this, let it happen by itself.

Q1: *conf. bias > coincidence > synchronicity > "manifestation" > shifting > "jumping"*
I think this epic magnitude scale deserve a cool scientifically-sounding formal name :)
Why are "manifestation" and "jumping" in quotes?

Quotes: in the original comment context, because they are terms which have different meanings to different people, regarding the underlying mechanism. Ha, yes, I like the idea of a proper scale name!

...Well, the scale is meant to capture how it is being described (explained away!) by the person experiencing the change. It's the answer to the question "isn't that just confirmation bias, or coincidence?", formulated as "yes, but that is part of a graduated scale of changes arising from the same mechanism!". So it's "jumping" as the final one because that is the metaphor being used for more extreme change - where it seems that not only has the world changed a bit, but it seems that you are in a different (version of the) world! You have translated yourself across the Infinite Grid to another "dimension"!

Of course - as you point out - all the items on the scale correspond to a shifting of the "world-pattern" to different extents, in the ongoing now, with subsequent experiences being in alignment with that.

Jumping, at least for me, implies thinking of whereas superimposition implies more of thinking from.

Just to finish on this - Yeah, I do agree with what you say here, which is why although the subreddit (which predates my participation) is called "dimensional jumping" I've personally tended to push metaphors which take a consciousness-centric viewpoint rather than a content-centric one. You are changing the content of your experience; you-as-consciousness are not going anywhere.

POST: What happens from our perspective when someone else jumps?

Well, there is only your perspective, for you. Your experience of other people (doing this or anything else) is dependent on you, not them. You can really only think subjectively for this; there is no "outside" to your own experience. After all, how would you distinguish from you "jumping to a situation where I experience other people telling me they jumped" and a situation where "my friends are jumping and telling me about it". If it's all just experiences, and you can "ask" for any experience you like, then it's pointless looking for evidence, or interpreting things as being meaningful, outside of your own intentions and results.

I'm not looking for meaning or truth...

Well then I can say anything and it won't matter! ;-)

When I say there's no outside, I mean there's just no outside to your experience. There aren't any people, really, and you aren't a person. You are more like a copy of the world, and you are having the experience of being-a-world-from-the-perspective-of-a-person. When you "jump" you are basically shifting the facts of the world that you are, such that subsequent experiences will be consistent with that. You don't go anywhere, because you kinda aren't anywhere in the first place. So really, the answer to your question is: "that question doesn't make sense". If, we might ask:

- "Is it possible for me to experience a friend telling me they're going to jump, then I never hear from them again?" Yes.
- Or: "Is it possible... and they seem to change personality and even look different?" Yes, also.
- Or: "Is it possible... and nothing really changes?" Totally.

Because there is only your experience. You are always watching a film based on your own script. Jumping is always subjective, and there is no 'objective' viewpoint. There never has been. If you can do "things" such that people behave differently (and you can), that means they are part of you. So it doesn't make sense to ask them, or watch them, for evidence of what happens. They are just behaving consistently with your definition of the world. And remember: the same applies to "auereusFluvialite", because you aren't that person either, they're just a part of you. That all got a bit philosophical eh? Oops.

The trick is, I think, to stop thinking of the world as a "spatially-extended place unfolding in time", and instead view it as a "resource" - a collection of patterns, a toy box of possible experiences, which we can pull into awareness. So, if you think of yourself as not a person, but literally as an "open aware space" which can "take on the shape of" any experience, it makes it a bit clearer. The background of this space contains all possible patterns and facts, and they are always contributing to your experience, but

different patterns are "brighter" than others, and so contribute more than others. So facts like "I am always lucky" and "John has green hair" and "I live in Tokyo" and "Things fall when dropped", they are all patterns which affect experience to a greater or lesser degree. How does this help? Well, it means that the answer to "what will you experience if someone else jumps" is really about: what "facts" about jumping are currently contributing to your experience?

It's the equivalent of watching a movie where the scenes have been selected according to the concepts that are currently active in your mind. (Which kinda happens: synchronicity.)

POST: I did the two glasses experiment...and I'm feeling less skeptical now.

It doesn't seem like the glasses experiment worked for me...

When you did it, did you simply write on the labels, or did you contemplate the situations at the particular points during the exercise? That can mean the difference between a general change corresponding to the extended pattern of the words ("acquaintances -> best friends" applied to the next available context without regard to specific people) vs the specific situation and person you were working on. It sounds like it did work, but as an overall pattern applied globally. It might be the case that all your acquaintances now shift towards being friends now, and that might include your target, or it might be that this specific context window will be the main effect. (Not something you can tell without knowing the subtleties of your state at the point of change, which even you can't know really.) Regardless, I'd let this recent shift have time to settle out before you do anything else.

It doesn't need to be complicated or effortful though; it's simply a case of deliberately deciding what the labels mean, what their context is. It's the same as any pattern activation...

For instance, with the owls exercise one simply pauses and imagines an owl. If that's all you did then, literally, what's happened is that the extended pattern of "owl" and all its associations have been triggered into "brightness", such they will contribute more prominently to your experience from then on. The pattern is overlaid without limitation in time, space, or context. Owl-related aspects appear everywhere and in everything, even apparently retroactively. However, if in addition one had made the decision that imagining the owl means-that you would see more owl t-shirts then, mindful of that, the result would be narrower, more focused. (Although you'd still see some signs of the extended pattern - that can't be avoided, that's what synchronicity is, and "collateral shifts" are.)

So...

Wait a little while, then repeat the exercise, but this time be cognisant of the meaning of the act - i.e. your intention. Actions without deliberate intention just trigger their broad, pre-existing meaning or extended pattern. Actions with deliberately assigned meanings, trigger the more specific patterns associated with the intention. Snappy bullet points from elsewhere:

- Act + Intention + Detachment = Shift
- Assigning a meaning to an act is what gives it causal power.
- Assigning a meaning to any experience can give it causal power.
- Habitually observed cause-effect relationships are the outcomes of previous assignments or associations.

That shit sounds like it's straight out of the Kybalion... (I ain't even mad!)

Well, if it's from the yogic traditions, it's all the same stuff. I mean, how stuff works is how stuff works; there's only different ways of saying it.

POST: New to this, and looking to make a big change

I'm so sorry to hear about your fiancé, that's a terrible thing for you to have to go through. From the ideas discussed here: your fiancé may apparently have passed away from your perspective, but from a larger perspective it's more accurately described as: your two conscious experiences are no longer overlapping. Experiencing always continues for both though, surely, but also unfortunately. I suspect that to make a change to reverse this would be very difficult. By its nature, if someone succeeded in doing it they likely would not speak of it, and it would obviously be wrong for someone to give hope that it can be done if they have not actually done it themselves.

(If there are ways we can help beyond that, we're here for you, obviously.)

He continues on, surely. Perhaps this isn't appropriate, but on that front, every NDE I've ever read sounds like a pleasant experience (see examples of reports), so despite your separation and how terrible that feels, I think you can be certain that he is well. Hmm. So I'm not sure where to go with this, since I can't exactly recommend trying a reset, although you can pursue that. In terms of recovery of yourself from the situation (without having had to practice anything), others have had success with this simple exercise - but that is more appropriate for a time when you feel you want to let go, and it can help things shift once you have a direction again.

You know, the underlying notions that your fiancé was probably interested in, are the basis of this subreddit. Plus maybe lucid dreaming, all those sorts of things. I'll save you the philosophy though, now is not the time. Actually, for your life more generally - it occurs to me for no reason - you might like to check out lucid dreaming. Here's a link to what's probably the best book on it (I keep a folder of the books I like so I can share). It also has relevance to our discussion, perhaps.

POST: Is it possible that I already jumped to where I wanted to go, but forgot that I was somewhere worse?

Q1: With God all things are possible. God is leading the charge, so it is entirely possible that the wisdom of God wanted you to forget that you jumped from somewhere else. Perhaps a traumatic event happened, and it would just spoil your new life here to think about it constantly. Enjoy what you have - it is a gift!!!

*A1: You were downvoted, but you're right, it's true. **With me**, all things are possible.*

Q1: I was downvoted soley because I mentioned "God"... there is a reddit animosity about God for some strange reason. And you are not God, but you are a piece of God, a god spark so to say. Without you or me God wouldn't be whole.

It's not reddit animosity here - it's that the concept of an active entity god, one that "wants" things and acts independently of you, doesn't fit in with the general view of the subreddit, so explaining things in terms of it isn't likely to generate a lot of enthusiasm. It's basically a case of being off-topic.

Broadly speaking, this subreddit takes the view of philosophical idealism. From that perspective, we might say that everything is "one" and we are all "connected" in the sense that all subjective experiences arise within consciousness/awareness. The phrasing would be something like, "an open aware space, taking on the shape of a world-state, as the experience of being-a-world-from-the-perspective-of-a-person" (catchy, eh?). The concept of "God" pretty much dissolves in that picture, because there is no separation between the nature of experience and the content of experience. You can use it as the word to mean "all this" or "existence", or sometimes people use it to refer to "imagination" as both the essence of things and the power of creation, or as aspect of the pattern which is not presently unfolded into sensory experience - but it's pretty much redundant. Plus, it often acts as a barrier to understanding since it doesn't correspond well with most people's conception of "God" as either an independent thing, or something you can be a "part" of. (And people can have "entity god" type experiences too, so it's best to keep that word out of the general description.)

So I wouldn't imagine that anyone here is angry at "God" - that would be like getting furious at existence. (Although that might be a good title for an album...)

POST: Jumping to a reality with magic/different laws/different technology?

A1: A lot of people are going to down vote me but this is already possible in this dimension.

Q1: How is this possible? I'm genuinely interested.

AI: I know there are fake videos on YouTube but there are also real videos as well. Jump on there and search for stuff like PK, TK, aerokinesis, pyrokinesis, electrokinesis, etc. Doing a Google search for telepathy or psychic powers will help you find more information on how to unlock your soul. I've been learning PK for the past two years and I'm still weak as far as my level of ability but there are some folk who are much more advanced than I am so it is not impossible for what you ask. As far as magic or "magick" goes just check out /r/occult or similar groups in /r/psychic. I started out in /r/energy_work. Check the side bar for each and there are other subs that they reference that you could link to. You could peruse my comment and post history to see what kinds of things I've commented in too. I have no doubt that there are dimensions where I'm more adept at manipulating reality but where is the fun in learning if all the difficulty is already gone? Ultimately dimensional jumping, occult practice, or energy work is all talking about the same thing. It's just a matter of finding the niche that you currently relate to the best and then going for it. I recommend starting with meditation if you've never done it before. That is what directed me to start looking into PK and the meditation practice trained me enough to actually succeed sufficiently to know it is real and then keep at it with my practice. The thing that I've learned is that you have to be patient when gaining super powers. It's a hard lesson but I think I finally understand it. I've turned my attention toward growing spiritually instead but that doesn't mean I'm not getting stronger with super powers at the same time. The best part about all of this is that you don't have to believe a word I'm saying though it will help. Learn to do it. Be patient and keep trying. Everyone has different results in changing their perception of reality and thus everyone has different rates of progress. I managed to turn a psi wheel (another good YouTube search term) on my second day of trying but couldn't get it to happen again for two weeks and then it took almost another month after that. These days I can do it almost every time I sit down. We are deprogramming ourselves and learning to do something that is very difficult but doable. I didn't believe it wasn't some kind of stray air current or static for 6 months.

Jeffrey Mishlove's book, The PK Man, is worth a read. The subject's supposed method was, essentially, a deprogramming or circumvention of expectations - which I think is generally what's required for direct and sensorily-experienced intentional change in the moment (as opposed to misdirection + intention). Everyone should try a bit of cloud bursting on boring car journeys, at the very least.

AI: I'll check that out. I have to agree about cloud bursting. Nothing more satisfying than making them disappear. I have yet to master making clouds though. It's weird how stopping motion seems easier than generating it even though energy never truly stops moving. I think it is a human belief born from hardship and whatever the situation appears to be.

It's generally harder to create (apparent) things in front of you; it just generally feels less plausible. You can rationalise clouds dissipating, but it's not so easy to explain away the coalescing of things - it's not something we generally observe (broken coffee mugs reassembling, etc). However, decide that the rainy day is going to be sunny, or vice versa, potter about indoors for 5 minutes (harry potter, perhaps!), and the whole sky can be completely different.

Observing and reacting tends to solidify things, I think. For visualisation, it really should not be effortful; it's meant to "come to you". Have you tried imagining-that and letting it autocomplete? (As in, you imagine the fact of something being there, implying its presence, and let the sensory imagery fill in for you.) I first used David Fontana's The Meditator's Handbook and its advice - it might have been an earlier edition than that - but it basically amounted to: try and try picturing, eventually you'll get good at it, but what you'll realise is that you got good because you gave up, thus allowing the 'unconscious' to fulfil your request for you.

Something to try: check where "you" are looking out from, the location you seem to be. Perhaps it is too close behind the eyes? Sit back a little in your head, such that you are behind the eyes, but halfway back in your head, on an imaginary centre line that runs through your whole body. Then, experiment with resting at different points along that centre line, from the top of your head down to beyond your abdomen, and find the place that feel like "home" for you. That "rest position" should feel more open and calm and aware than the others; it makes any intentional activity far easier. Anyway, do have a play with it and see if that helps at all.

This is harder than it sounds. :(

Be sure you are not contracting when you try to do it. Stay "open" but sort of "include" and 'lightly reposition" yourself there. Remember, there's no physical-muscular component to doing it. Yeah, it's very hard to describe!

As an exercise, maybe just begin by seeing if you can "feel" the position at your lower abdomen, in the centre of your body. Then, decide to move that imaginary point around the room, letting your body follow it.

Can you elaborate on what you mean by contracting? I am noticing that I want to put my awareness 100% into that spot so it is as though I'm in a little elevator. I guess shrinking my perception of me could be what you mea.

Don't narrow your focus down at all. In fact, you should never narrow your attention deliberately; intend only. It sounds like you are trying to "concentrate" - don't do that. Stay open and expansive, but just have your "home" as the new place. The idea here is that you are reconfiguring your rest state; therefore it shouldn't involve any effort at all.

This is quite the conundrum. Lol I'll keep trying to figure it out.

No! Do not try to figure it out! That's probably the problem. Do this right now: imagine that you are a sort of fuzzy energy that is expanding and filling the volume of your body. Now expand out to fill the room. Do not sit in your head thinking about this, actually expand your "presence" to be that fuzzy energy. You become this, rather than sit in your head, try to be in one place and then do it to another.

I've tried multiple times to do this so far and bleh... The funny thing though is that I've done this unintentionally at least a handful of times. It almost sounds like you're describing bilocation.

Hmm. As I say, I can only think you're trying to be "here" and then "be there from here", rather than expanding yourself to encompass that point, but it's tricky to suss out in words! It's really a matter of relative intensity, since you are actually "everywhere" in your experience; you are just attending more to that location than you would. You could perhaps approach it as an imaginative exercise - maybe "imagine that" you are a sphere in your lower abdomen, and that everything else just follows that sphere's movements?

POST: have there been any studies/documentaries about this phenomenon? On youtube perhaps? any outer likes that do not reside from reddit?

In terms of "things changing" spontaneously there are probably been some stuff on the "Mandela Effect" and so on, but it'll have been from a social phenomenon standpoint I imagine. But kinda by their nature, these things can't be studied objectively, because they are "before" objective study. And as with other approaches to understanding the nature of experience and changing it, people generally aren't particularly interested in conversing about it much for a larger audience, because there's not much to say. There's nothing to point to that you can say "that concept is true"; all concepts are up for grabs. It always ends up with a bunch of people trying to describe consciousness. (Which is pointless, since it's the thing that descriptions are made from.)

Basically... It's a subjective thing and a practical thing. If someone did make a documentary, it would be a bunch of metaphors in row. Perhaps someone would drink a glass of water at some point.

What about a book TriumphantGeorge, any chance you will be bringing one out? Love your techniques and I want to read more.

If I came up with an interesting way to present it - a sort of Edward Tufte or Mark Lombari plus Peter Saville approach to it - then I might be tempted. I think there's a bit more work to do on the metaphors first anyway, though. (And: thanks for the encouragement!)

Peter Saville's work reminds me a bit of Hipgnosis.

Yes, it does have that Hipgnosis thing. I think Saville, Mark Farrow and Stylorouge all covered similar ground in their time, but I've always loved that "informational typography + stark diagramming" approach. There are lots of good designers who are more recent, of course, but I think the aesthetic developed by those groups became the "modern style" and there's not really been much since about which you could say: this is a departure. I recently watched Fresh Dressed and it's interesting thinking about

how these elements have intertwined to give us today's visuals. The decline of tribalism in music, fashion and design over the last decade particularly means there's less of an obviously defined development taking place now. Everything is all-at-once. Which is appropriate, actually, for this subject. Back on topic - I think it's maybe important to find a way to present these sorts of ideas [jumping and patterning] that avoids "scienciness", new age, or magickal-philosophical tropes - that is sort of its "own thing" and is immersive, so you're not just reading about it, but having an experience of it too (it sounds cheesy when written like that, unfortunately). A modern, practical metaphysics which separates itself from unfortunate associations - and maybe makes a nice coffee-table book (only half joking there).

POST: To seek on the outside for that which you do not feel you are is to seek in vain, for we never find that which we want; we find only that which we are.

Yeah, he's the man. **Everything arises within the mind**, both the "external" and the "internal". If you want an experience to arise in "the world", then you have to summon or intensify that pattern within the mind. If you go looking for it in the world, all you are doing is exploring your current state. If your current state doesn't have what you are looking for activated with in it, you'll tend to have experiences about what you are looking for, rather than experiences of what you are looking for.

how may one " Experience of what we are looking for" instead of "what we tend to have experience about what we are looking for" ? :)

Say you are looking to live in a specific house, you get enthusiastic about the idea, but you don't actually shift state (imagine it 3D-immersively), you just think a lot about living there (imagine images of the house and people living there). You start noticing yourself encountering conversations, or local news articles, about the people who are currently living in the house, seeing other houses that look quite like it in documentaries about people's lives, and so on - experiences about living in the house, but not the experience of living in the house. It's a variation of that.

Wow i actually experienced this plenty! How may 1 shift his/her focus upon actually experience living in the house instead of living about being in the house? Your explanations are always phenomenal

This is why I try to push a literal interpretation of the "imagination space" idea. When you imagine the house, how do you do it?

If you imagine an image of a house "over there", a house-thought floating in space in front of you, then you are basically intensifying that pattern of house-image-over-there, which is an experience about a house - and you will find that and its extended pattern incorporated into your subsequent experiences, as if that pattern has been "overlaid" on top of your ongoing life. To be clear: when you do that then you are creating and intensifying, right then and there, the imagination-experience of seeing an image of a house. What you want to do instead, is create and intensify the imagination-experience of actually being in the house, and living within the desire, so that you are triggering an immersive, first-person pattern rather than a remote, third-person one.

Summary - Really do summon into the space that you are the experience you want to have, an experience that implies you have what you want. (The alternative is to operate indirectly, and create an image which means-that you will get what you want. You can also do this by assigning meaning to physical objects, attaching states and patterns to them; this is how the two glasses exercise works.)

(according to this idea there is no difference between the 'internal' and 'external, they are **one thing**)

Exactly. Internal and external, like me and not-me, are arbitrary divisions; there is only you-as-state.

How may one intensitfy this pattern? Is it mainly through imagination?

To imagine *is* to intensify - which is why it matters whether you do it in the 1st person (3D-immersively) vs the 3rd person ("over there"). So any intentional act is an act of imagination, of intensifying one pattern relative to the others.

POST: Do you need to drink all the water to jump?

There is no need to get too obsessed with the details here. The intention and commitment is what matters most. I would definitely drink the full glass however. Other drinks might be fine but they usually come with extra personal associations, so why would you not use water?

EDIT: Note, this was mostly a reference to this comment by OP: Also, if I drink half of the water, will I half-jump? Or will it just pause so I can continue later? May I use other drinks? .

Although it might be fun to think of "what ifs", actually you should seek to avoid overcomplicating it for no additional benefit. The more you mess around, the more you are introducing additional associations that you can't anticipate. If you are doing the exercise with the expectation that it will work, then it would seem silly to take the risk - it would be like having a teleport machine and wondering what happens if you only step halfway into it, or only type in some of the coordinates, or set the teleport beam to a lower intensity. Good luck with that! ;-)

(More accurately: it's like using a technique to change the structure of your mind but only following half the instructions.)

Q1: *The intention and commitment is what matters most*
Got it, so if it doesn't work, it is my fault. Just my intent and "commitment"
How may I further seek enlightenment?
There is no need to get too obsessed with the details here.
I don't think I'm obsessed over details, just trying to ask you some questions due to the original instructions being unclear.

Why are you so upset? (**EDIT:** You edited. Previously there was an insulting line about being a fuck-up who never graduated from school. **EDIT2:** You edited **again** to add the final sentence, which does I suppose make you seem more sincere and worth engaging with, but you added it an hour and a half after you posted the comment in its original form - too little, too late, the damage was already done.)

It's just an exercise to demonstrate something about the mind and the world, and people can take or leave it. Nobody's promising anything, or even promoting anything. If it doesn't work, it doesn't work, and people can just move on. You sound like someone who... probably hasn't thought about things very much.

Q1: *I'm not upset, you must be talking about another dimension. I'm only asking you if you support users attempting to cure their social anxiety and other psychological issues with your subreddit?*

I support users doing whatever they want. If someone has social anxiety, then they can "attempt" to fix it with prescribed pills, or "attempt" to fix it with counseling, or "attempt" to fix it with hypnosis, or "attempt" anything else they want. Whatever's helpful, is good, regardless of ideological concerns.

Q1: *Why the quotation marks?*
Also can you elaborate on this part and why you brought up ideological concerns? Do you see any ideological concerns in supporting the use of dimensional jumping to "attempt" to cure psychological illnesses?
Whatever's helpful, is good, regardless of ideological concerns.

The quotes were to emphasise you own use of the word attempt, which implied there were other guaranteed, proven, theoretically sound approaches to curing, say, social anxiety. I haven't encountered any (although there are many things that can help to some extent). I brought up ideological concerns, because approaches shouldn't dismissed (or accepted) on the basis of narrative concerns alone. You do realise that "dimensional jumping" is a metaphor, right? It's not about literally teleporting to other physical realms. Also, it is not particularly about curing psychological illnesses (although someone could certainly use that as the target for experimentation). In effect, it's a demonstration that experience is someone philosophically idealist. Separately though, we might wonder what the nature of a "psychological illness" is, exactly, of course. That such things exists is apparent, but what they are isn't very clear.

Q1: Also, you never elaborated on this quote, I hope you aren't trying to avoid it:
If you are doing the exercise with the expectation that it will work, then it would seem silly to take the risk - it would be like having a teleport machine and wondering what happens if you only step halfway into it, or only type in some of the coordinates, or set the teleport beam to a lower intensity. Good luck with that! ;-)

First, a suggestion: if you actually want to have a discussion about this, you should adjust your tone and be less aggressive/defensive. If you just want an argument, you can take it elsewhere. So, not sure what you are asking about that quote? The suggestion is, that if you are going to perform an exercise of some kind, with a result in mind, why would you only half do it or not otherwise follow the instructions?

Q1: if you actually want to have a discussion about this, you should adjust your tone and be less aggressive/defensive. If you just want an argument, you can take it elsewhere.
So, if I actually want to have a discussion about this, I'd better obey your suggestions? I've only noticed defensiveness from you, to be honest. Are you sensing aggression in me? Do you feel threatened? You seem to be avoiding my simple requests for you to elaborate on this concept you created. Also, are you familiar with satire? If so, how does satire relate to the subjects we discuss?

No, I don't feel threatened because... well, I'm not here to defend anything or persuade you of anything. I'm happy to discuss things. If you want to engage in satire - great, knock yourself out. But it probably makes sense to actually understanding the nature of what you're satirising first; that's what I do. You seem awfully emotionally hyped about all this. Why?

Q1: You seem awfully emotionally hyped about all this. Why?
I'm not, what makes you feel that way? You seem awfully defensive and have projected some of your insecurities onto me. Did you notice that? Also, are you implying that I don't understand satire? Here is the definition: "the use of humor, irony, exaggeration, sarcasm or ridicule to expose and criticize people's stupidity or vices, particularly in the context of contemporary politics and other topical issues."
You didn't think that satire was just acting like you were the subject of your criticism just to criticize it, did you? Because that's not what I'm doing. Satire has many forms. Literal forms.

Oh, don't be so tiresome. I didn't imply at all that you didn't know what satire was. You didn't read my comment properly: it probably makes sense to actually understanding the nature of what you're satirising first

As in, if you are going to be satirical, you have to be satirical about the actual thing itself, not about some parallel idea you have about it. Otherwise you are just being unpleasant. Since you're not actually engaging with the discussion, there's not much point to this. I'm happy to bounce back and forward in some wordplay usually, if it's entertaining. You do seem to be under the impression that I'm defending some sort of position here, though!

This is only relative to your endurance not matching mine.

Ah, so this is a battle of wits, a challenge of persistence and strength, to win through attrition? ;-)

I dunno - why do you care about "winning" at all? What is there even to win here? I'm not even trying to persuade you of anything; there's nothing to persuade you of, in fact. Your idea of your situation here, of the context of this chat, appears to be... incorrect.

How many things, according to you, is one allowed to satirize at the same time?

See, you've missed the mark again. My point was, plainly, that in order to satire something, you need to know what it is you are satirising. Since you blundered into this subreddit, all ready to triumph over ignorance, all you've done is revealed that you don't really know what the target is.

Do you know that /r/ThreeKings is a child of the fiction sub /r/nosleep?

Well, it's an offshoot inspired by it. The actual ritual (and related: the doors of perception one) has a long history, related to entering a detached mental state. As I say though, that predates my involvement. Related post on the nature of perception: Darkroom Vision. Fascinating stuff.

Q1: I dunno - why do you care about "winning" at all?
Are you quoting me or yourself? Because you're the only one who mentioned "winning". Also, regarding Theroux, have you noticed a common trend among his interview subjects? They seem so absorbed in their own work, so eager to be in the limelight, that they often reveal the flaws of their work? To be direct, are you upvoting yourself through alts, breaking Reddit rules? Your points seem oddly consistent here, and usually variances occur, along with people downvoting opposing viewpoints. Seems like I haven't been downvoted, consistently, other than my original post. Almost as if someone doesn't want the post to be seen, yet wants validation to their views within the post.

The quotes are (obviously) to indicate that there is no such thing as winning in this context. How can you "win" a discussion? (You must have seen quotation marks used that way before, right? If not, consider it a new string to your bow.)

So, do you feel absorbed in your work? Are you keenly aware of the flaws in your thinking and in your approach? What to you think Louis Theroux would make of you? I think you are projecting your own ideas and self-image on his work (which is a bit more nuanced than you think, I think), and any idea you might have of yourself as a champion of rationality seems... unsupported by the evidence. No alt accounts (really, do people bother to do that? care that much? it's just... an online forum!) but you did end up on the spam list because you were reported for trolling. Everyone's up for a discussion, but uninformed ranting is of no use to anyone. Was that neutral journalism in action? ;-)

...

Q1: You do realise that "dimensional jumping" is a metaphor, right?
I suggest you add this to the sidebar.

Relevant excerpts:

OVERVIEW
The essence of Dimensional Jumping is the leveraging of perspective-structuring metaphors and the techniques derived from them. **It is for readers to decide for themselves through personal investigation and introspection whether jumping is appropriate for them or not. Never believe something without personal evidence; never dismiss something without personal evidence.**

Note, however, that being "just" a metaphor doesn't mean it can't be used to accomplish things, specifically: **reformatting your experience.**

Q1: Are you familiar with Louis Theroux? Also, when saying "personal" evidence, are you referring to anecdotal evidence?

I am indeed familiar with Louis Theroux. I'm referring to trying something out for yourself, to see whether it provides your with a particular subjective experience. I'm not sure what your point is there? You'd be better off speaking more directly. To emphasise: the subreddit (as far as I'm concerned; I didn't originate it) isn't promoting a particular worldview as true. It's saying: here's a model of experience (basically a modified subjective idealist view) that's interesting to explore, you can check it out by investigating it yourself.

Q1: I am indeed familiar with Louis Theroux.
How do you think he would react to your sub and the discussions you've had regarding it? (not just with me, but with others) All documented and archived on Reddit? Do you feel a personal sense of affinity towards Mr. Theroux or more towards his various guests in interviews? Also, do you think most of your readers actually believe that your "exercises" are metaphors? It seems like the posts made by those whom seem to not think that this is not a metaphor aren't reminded of the metaphor part. Do your replies to them address this phenomena? Also, when did you first create these exercises?

Sorry, what exactly is the point of this exchange, if you're not actually going to have a discussion or state your own position?

It's not that complicated: The subreddit itself started (before my time) with some sort of mirror ritual reminiscent of /r/threekings. Gradually it's morphed into an exploration of the potential use of the philosophical idealist (or non-dualist) viewpoint + formatting metaphors, to make changes in your experience, and to examine the nature of the subjective experience more closely.

Q1: Sorry, what exactly is the point of this exchange, if you're not actually going to have a discussion or state your own position?
To give you a chance to explain you sub, of course! Also, to ask the questions which the public may ask when stumbling across your sub. Although why are you asking me this now? I know you didn't feel threatened a few seconds ago, but do you feel threatened now? You seemed defensive towards the very beginning. Why is it that whenever you change the subject, a few of my questions go unanswered? My questions are very direct and I aim to emulate Louis Theroux's neutrality. Care to answer the questions you've avoided, or shall I aggregate them into a list?

I think perhaps you have not been paying attention to Louis Theroux very closely! I've been a fan of his since his work on Michael Moore's TV Nation. Good interview with him in The Guardian earlier this year:

[QUOTE]
“No, I go in to tell stories, to reveal the truth and to try to understand. Not to set people straight,” he says. “I don’t go into this with the agenda of saving the world.”
-- Louis Theroux: ‘My secret fear is that I'm not helping’
[END OF QUOTE]

He takes a neutral stance and seeks to understand and explore a topic on its own terms, from the inside. He does not actually take satirical or mocking stance in his documentaries. Furthermore, he doesn't make barbed comments and then re-edit them. (Seriously, what was all that "never graduated from school" shit earlier?)

So, are you imagining you are conducting an interview or an investigation? Perhaps you feel you are performing a public service of some sort? Are you fantasising or roleplaying about being an "online Louis"? Because if you really wanted to do that, the correct approach would be to engage and fully understand it on its own terms. So, personally I don't really identify with a particular position - I think ways of thinking are useful or they are not. I aim to keep separate the experiences or observations, and the conceptual frameworks or "connective fictions" which we use to explain them to ourselves. Do you identify with a particular position, as being true?

What it seems you are trying to do is "debunk" the subject of this subreddit. Which seems a bit pointless to me, and the equivalent of trying to debunk a diagram or disprove the subjective experience of seeing colours.

Q1: You know that to keep one's status as journalist, one must state neutrality, correct?
It seems like you understood Theroux's statement, yet didn't understand why he made that statement. As for the rest of your points, I'll address them after you address the questions which you've avoided answering.

So are you suggesting that a journalist should state neutrality, whilst actually pushing an agenda? ;-)

That seems to be your approach anyway, perhaps unwittingly. Also, I may be wrong (forgive me if that is so), but you strike me as being one of those people who is perhaps really into popular science (but never actually studied it or the philosophy of science). That's okay, but often such people tend to be "defenders of the true worldview" rather than actually of a scientific mindset. With that in mind, exchanging question is pointless, since we aren't going to be exploring a subject - you are going to be seeking opportunities to "win" an argument which only you are having, so that you can once again feel comfortable with the set of ideas you have become identified with.

Q1: So are you suggesting that a journalist should state neutrality, whilst actually pushing an agenda? ;-)
You are mistaken (again, I wonder if you are trying to keep this discussion unfocused), I'm pointing out that your comments have shown that you don't understand that journalists do need to maintain neutrality to be considered journalists, yet it is common practice to push an agenda. Why the winks? Do you think you're being witty?
That seems to be your approach anyway, perhaps unwittingly.
Things may not always seem as they... uh... seem? Ironic, you use the word "unwittingly" as you delve deeper into... your "thing"
You still have not answered many of my more important questions, often opting to misinterpret and keep the discussion unfocused. I ask you this one again, though: When exactly did you first come up with your "exercises"?

Well, if you have an agenda, let's hear all about it! Then we can have a proper discussion. Because at the moment it isn't actually a discussion. And it certainly isn't journalism either, if that's the fantasy you are holding onto, given your comments so far. It's just non-constructive trolling, which is of no benefit to anyone. Aside: What you are referring to above isn't journalism, not even advocacy journalism - it's propaganda.

Q1: Are you familiar with James Randi? Also, what makes you think I'm coming from a journalistic angle, didn't you forget our talk about satire, son? creepywink!;-)
if that's the fantasy you are holding onto, given your comments so far.
Looks like your subconscious might be taking my points to heart, and expressing itself without your control. You might need to jump again.

Randi, yeah what a joke. He's set skepticism back decades, in my opinion. :-/

Q1: Literally laughed at you. As much as you try to keep an aura of level-headed kindness, you will definitely refer to people as a "joke" when put into a corner. You are a joke. You are not helping anyone. I don't need to be fake like you in an attempt at bravado/preserving non-existent integrity. Explain how he set skepticism back by decades. Also explain how skepticism relates to this sub and to how you should act when people don't realize this is a metaphor. Maybe I should email him and explain our correspondence? He's been on Reddit before. #creepywink ;-) *Maybe I should also contact anonymous, to confirm if you are trying to make money off this quackery. Anon is busy at the moment, so I'll give you a chance at redeeming yourself. Also, are you promoting other websites or paid-for services? Are you a failed Psychologist attempting to be a Parapsychologist? "Some within the parapsychology community were outraged, with Dr. Berthold Schwarz (R.I.P. QUACK) declaring: "Randi has set parapsychology back 100 years!" Randi's approach also raised outcries concerning ethical considerations and doubts about positive effects on methodology awareness,[13] both within the parapsychology and the skeptic communities. But Randi reports that other parapsychology researchers have contacted him with praise, describing the project as "splendid and deserved", "an important sanitary service", "commendable", and "long-needed".* *" The reason I brought up Theroux is because his subjects for interview are often so self-absorbed and pathetic, along with being arrogant and fake, thinking they can fool the masses... that they dig their own grave and become the subject of ridicule for normal society at large. Especially among scientists, doctors, journalists and others who are doing the real hard work in advancing science and medicine. The ones that didn't flunk out of med school and start a website to promote on Reddit.*

Last comment on this thread - let's keep it to the new one you started [POST: How many of you know that this is just a metaphor and not a substitute for Science-based medicine and counseling? If anyone tries to sell you anything, don't buy it. It is a scam.].

Although Randi did entertaining work in his reveals of magician's tricks used in public claims of "supernatural powers" (for instance, Uri Gellar and James Hydrick), he is a showman and magician, he was not proceeding as a rational thinker, and I don't think he ever intended to. He is not a useful model for skeptical thought, except in the sense of not adopting views without satisfying yourself of their worth. He also comes with a lot of baggage due to legal stuff. (I think Randi has retired now, has he not?)

As regards this subreddit - read the sidebar. The foundation of it is a questioning attitude and that nothing should be taken as fact without personal exploration. Actually, the underlying idea is that the only things you can be certain of are:

- That you exist.
- That you are having experiences.

A skeptical attitude should be adopted for everything beyond that, when it comes to interpreting those experiences. In other words, you should separate out the experience from the explanation, and recognise that all explanations are connective fictions, to be adopted or not depending on their usefulness. I'm not promoting anything at all, here or elsewhere. And if someone was going to do it based on this subreddit, I'm not quite sure how exactly they'd set up a paid-for service based on "don't believe anything" and "don't take anyone's word for things" and "these are metaphors". Maybe they could sell subreddit-branded water glasses? ;-)

EDIT: So, you later added all the stuff from "Are you a failed Psychologist..." onwards...

Ah, you seem to think this is some sort of paranormal thing? Which just shows you still don't understand it. You also seem to be viewing this subreddit as some big deal, whereas to everyone else it's just a tiny inconsequential online forum, on a massive website, on a massive internet. Look, I get that you have your favourite role-models, and you have a particular worldview, but you're missing the mark here. So, a few of mine would be George Ellis, David Bohm and Paul Feyerabend. Have you actually read physics or philosophy, or are you just a "defender" of a vague notion of those subjects? Holding up James Randi and Louis Theroux (fine folk though they may be) as your primary champions doesn't seem, I dunno, very convincing somehow. You're basically just ranting here, now.

...

Q1: Why are you so upset? (EDIT: You edited. Previously there was an insulting line about being a fuck-up who never graduated from school. EDIT2: You edited again to add the final sentence, which does I suppose make you seem more sincere and worth engaging with, but you added it an hour and a half after you posted the comment in its original form - too little, too late, the damage was already done.)
No I didn't you must have been in another dimension where I did.
.....You sound like someone who... probably hasn't thought about things very much.
Wait, I thought I was the one in this dimension that was using personal attacks and insults. Why would you do such a thing, oh enlightened leader who isn't a scam artist looking for attention on the internet while spouting self-help quackery which could be dangerous to anyone who actually wishes to improve themselves?

Self improvement? Exploration of experiencing, maybe. Heh, well we've had fun here, haven't we? I think you got a bit caught up in the "dimensional jumping" metaphor, rather than the underlying thing (which is really more like: adopt a philosophical idealist view and from there explore the "patterning" nature of experience though experimentation). Thanks for engaging! ;-)

POST: How many of you know that this is just a metaphor and not a substitute for Science-based medicine and counseling? If anyone tries to sell you anything, don't buy it. It is a scam.

Discuss!

I think the poster doubts this subreddit's ability to think rationally, entertain ideas, and make choices. I also think that he misunderstands the whole thing. But perhaps that isn't for me to say.

Edits

EDIT: For context if interested, see this recent conversation [POST: Do you need to drink all the water to jump?]. The final comments were here. Discussion will now be constrained to this thread. EDIT2: Link to my specific comment about James Randi: here. EDIT3: And taking it personally as a mission.

Update

For completeness, I should mention that OP's post seems to be a follow-on from his earlier post over at /r/skeptic. There's actually another post over there at the moment which is a quote from Steven Novella on skepticism, and it's worth reading that in full even though it's on a particular topic. See below:

[QUOTE]

"The skeptical outlook is to consciously remove oneself from any emotional investment in any particular belief. Instead we align our identity with the process of science, listening to facts, and following valid logic and sound arguments. Part of this is being transparent and engaging intellectually with others. The critical analysis of others will keep us honest. We must be our own harshest skeptic, for if not others will expose any flaws in our process. We will then be under pressure to examine our methods and change our conclusions if necessary. Essentially being a skeptic and being part of a community of skeptics harnesses inherent human psychology toward being logical and scientific, rather than irrational and emotional. As a skeptic my primary motivation is getting it right (not defending any particular position), and if I don't I know that other skeptics will point out my error, and if I don't properly engage with their criticism, or if I dig in my heels, I will lose credibility."
-- Excerpt from Steven Novella article

[END OF QUOTE]

The poster then adds:

I think this is what sets skepticism apart from other -isms. Unlike political ideologies or religions or other belief-systems, it focuses on methods for finding out, not on particular conclusions and beliefs. Which I think is its greatest strength.

Good stuff and good comments in response. Although one should obviously approach even skepticism-related material with a healthy dose of skepticism, however...

...

A3: It is both sad and funny that people cannot see the true plausibility of the core ideas behind this sub. Of course, this disconnect is due to the name DimensionalJumping, which does undoubtedly sound bat shit crazy to people simply because they interpret there to literally be multiple physical dimensions. And it just fits in perfectly with that goddamn many-worlds interpretation so most end up taking it literally. It truly is unfortunate that this sub is named how it is and I really cannot blame skeptics for judging it the way they do. At it's core, this sub is built around the simple idea that consciousness comes first, hence why reality could be a bit more malleable than one would expect. And it isn't that crazy, since science has absolutely zero explanation for consciousness currently. Is it really that far-fetched that maybe, just maybe you have been making (incorrect) assumptions about the nature of your experience due to accumulated habits? Are people seriously this blind to the potential validity of this proposition? Take a step back and consider the fact that your lifespan compared to the length of human existence is literally like a drop of water compared to an entire ocean. Do you really think that your life right now is your one and only chance to live as a human for all of eternity? I am not against people who accept this (it is their choice), I am simply alluding to the fact that it really is not that crazy for someone to question and investigate what their true nature is through personal exploration. The intent of this subreddit is never to simply tell anyone what is or isn't true. Also, speaking from direct experience I have not once been asked to buy anything while participating in this sub. Ever. There is nothing to even purchase, it is literally free information. Although some purchasable Owls of Eternity™ figures wouldn't be half bad!

Yeah, the sub's naming is a historical accident really, as reflected in the intro post. Initially it wasn't really "about" what it's become about - that is, having fun exploring the nature of experience for curiosity and utility - and although it's a quirky and provocative name, it does make the initial impression misleading for the casual reader (or the skeptic who isn't a skeptic and is looking for a fight). But on the other hand perhaps a strong and engaging image gets people thinking in a way that a more dry or abstract presentation would not. At its core, we're talking about the ultimate skepticism: identify exactly what you are sure of, treat that and only that as fundamentally true, and absolutely everything else as only relatively true. And what you are certain of is one thing, although it is more easily stated in two parts:

- That you exist (you are aware).
- That you are having an experience (you are aware of content).

Anything beyond that is about the content of experience, and is up for grabs, and we treat all descriptions of that as provisional, as a convenient or useful or interesting or fun fiction only. (Note - It is useful to assert a basic level of form to experience though, and say that by default we are an "open aware perceptual space" in which experiences arise, or which "takes on the shape of" experiences. This gives us a ground or reference point for discussion and exploration.)

For instance, take the assumption that "the world" is of the same format as our experience. Although our experiences may arise in the form of a 3D-formatted spatial scene, that doesn't mean "the world" is of that format, that is it a "spatially-extended place unfolding in time". Unfortunately though, our thoughts are also formatted in this way (they are experiences too) so it's not really possible to think beyond this. However, we can certainly take the most generalised version of structure - we can talk of "the patterning of experience" - and, bearing this in mind, at least avoid committing to conceptual frameworks and forgetting that they are "connective fictions" only. The working

model for this is to provisionally treat the world as a dimensionless "infinite gloop" from which experiences are selected, in a manner perhaps comparable to scanning our attention around a 3-dimensional room. Our investigations, then, might be said to be about exploring the nature of the "selection mechanism" and its limits. Those limits, that basic and unalterable formatting, would, if reached, be the structure of the "underlying substrate" of experience, effectively a combination of the structuring of "mind" and "world" (one can't separate the two out). However, if no such limit was reached, then we would have to infer that there is no fixed underlying substate, and the patterning of experience is just that: accumulated habitual patterns which are subject to change. Of course, we could never make a final conclusion here. But that's okay, because this is really about freedom of thought and being skeptical of all narrative structures, based on (looping back round here) the recognition of the difference between fundamental and relative truth.

Next up - Our exciting new range of Owls of Eternity™ branded apparel! (8>)=

You are conscious in this moment right here, would you not agree?

I don't think we're conscious in the moment though? The moment is not the container!

Rather it's that consciousness is eternal and is the boundless container for all moments. The [sensory] moment arises within it. This means that the centuries never pass in time. Instead it is we - as time, as consciousness - that pass across the centuries. So perhaps: conscious of this moment. Better: conscious as this moment?

Yes I know, I meant that from a perspective that the average joe having minimal interest in this stuff could relate to (hence the word non-formal). My apologies if it seemed like I was directing the question at you. Really, you are absolutely correct though. It is an important distinction to realize that we are conscious of this moment rather than in this moment.

Ah, I missed the context when replying. So, yes, non-formally and without having to go into details, anyone can confirm for themselves the undeniable fact that "I am conscious, right now" - simply by pausing and noticing. And really, from that observation the whole perspective follows naturally, if one stays with it as one works through things.

...

A4: Riiight... because medicine is scientifically perfect, never hurts anyone, and doesn't have mile-long list of side effects. And counseling does what, exactly? Makes you think about your life and ways to change it? Hrm. That sounds pretty familiar, actually. I'd rather not pay inflated prices for someone else's knowledge, which I can easily gain myself by reading, discussing, and learning about anything and everything I want to. Counseling and medicine work for you? Great, fantastic, I'm so glad it helps. Sometimes counseling is precisely what someone needs. It can and does help a lot of people. Medicine is sadly not usually the answer, and way too many people are over-drugged all across the world, especially here in the US. Some of us, though, would prefer to not be zombified slaves. I've seen plenty of perfectly normal people, albeit misguided and lacking purpose, become completely fucking nuts, or turn to drugs, or even commit suicide after psychologists decide to tinker with their brain chemistry. I realize you are not going to listen to a word I say. I just hope I can help someone else who may have a chance at helping themselves before turning to mental-fuckery and popping pills like candy. These people belong to a whole different cult altogether. This cult is powerful, money hungry, and has convinced millions of people that they need drugs and therapy to help them deal with their crappy lives. I want to be happy from the inside, so I learn, I communicate, and I explore new ideas.

Q1: Riiight... because medicine is scientifically perfect, never hurts anyone, When you open with a fallacy.... I know what I'm dealing with, so at least I tried. Scientology before mitosis I just hope I can help someone else who may have a chance at helping themselves before turning to mental-fuckery and popping pills like candy Were you ever forced to pop pills? I'm a supporter of CBT, not meds.

It's interesting that you support CBT specifically though, since its current dominance is not uncontroversial. It's been suggested that its apparent popularity, like that of medication, might have more to do with organisational convenience than it having an accurate model that works reliably for solving problems (rather than helping endure them). It's currently being pushed as a blanket solution in some countries, when that is not really justified I feel, based on the depth of its model and the evidence to date. See psychoanalyst Darian Leader's article, A quick fix for the soul, for an accessible read on this, and cognitive neuropsychologist Keith Laws on Has cognitive behavioural therapy for psychosis been oversold? for more serious coverage. As always, if someone finds something useful then great, and one should try all reasonable avenues and that includes CBT. And of course, there is a difference between having developed poor thinking habits vs having developed deep depression or hallucinations! But we should be wary of hand-waving promises which are sometimes motivated by political and economic reasoning rather than scientific or intellectual integrity - which I think is often the case with this. Y'know, be properly skeptical and do our own research. (As I'm sure you do.)

...

A5: Aside everything else, re James Randi: if I had genuine paranormal abilities, the last thing I would do would be to go to James Randi. First of all, I would never advertise those abilities - ever - secondly, with that kind of abilities and knowledge, why would I need the money? How much is he offering these days, 1 million dollars? That's literally half a million pounds, and this is not that much. Ok, you can buy a house for that, but it is hardly worth exposing yourself.

Q1: You'd hide the powers in fear and use them for your own personal gain, yes. All as a metaphor, though. Just about sums it up. Lost, desperate and arrogant. You are victims of quackery. Downvoting me does nothing. Seek mental help instead of drinking a glass of water and hoping that it will somehow fix your life. Also stop seeing the glass of water as causal and not correlative.

A5: You are taking this too literally. What is wrong in a bit of speculation and thought experiments? BTW, an idea that reality is based on consensus is a sociological one, nothing paranormal there.

Q1: All as a metaphor, though. Literally? Really? Then why am I jokingly referring to the people who made this shit up as claiming metaphor, yet not correcting people when it isn't referred to as such. Then you start bringing up sociology? When this is an individual "exercise" being pushed on vulnerable people. Also, asking for a consensus from a biased sample pool isn't science. It is quackery, it is a an infant cult on training wheels. This self-help new-age fluff is not a substitute for proper counseling. I draw the line at meditation.

All as a metaphor, though.

Well, all explanations are effectively metaphors. What matters is how useful they are, how well their predictions correspond to experience. I hope you haven't developed the bad habit of thinking that stuff like "gravitational fields" are real things? Or if they are, in what sense are they real things?

When this is an individual "exercise" being pushed on vulnerable people.

Who's pushing what?

Now, I don't whether you or someone you care for has had some bad encounter with a cult or something - you seem pretty focused on this notion - and if that is so then you have my sympathy. But you do seem to be reading this subreddit from some pretty odd assumptions - assumptions nobody else seems to be making (probably because they read the sidebar before going all straw man on things). And what's more, you are then ranting instead of actually discussing or making a coherent argument. Which is ironic, since you originally posted your comment in /r/skeptic. Obviously, the paranoia about alts isn't helping (which I can assure you isn't the case, although I realise that won't help). Anyway, this thread here is your own special thread to engage with. Lay it all out, and people can judge your input as they see fit, and make their own conclusions from the responses you give them. But you really should lay out exactly what you think the topic of this subreddit is, and what is problematic about that. If you can't do the first of these, then you're not really saying anything at all, because you quite literally don't know what you're talking about.

I truly pity you

How can you be sure of that? ;-)

A5: Not because of fear - it is just, I would assume, I would be at the point of not being interested in such mundane things as money and showing off.

Q1: Wow, your hypothetical morals and course of action are inhuman. You're a God. How old are you, anyways?

A5: It has nothing to do with morals. Let's say you are giving a donation to charity - are you interested in showing off and telling everyone what you've done, or is it enough for you you are helping? This is, for me, the same kind of idea. Going with a hypothetical 'paranormal' power to Rabdi would be like Dalailama going on a TV reality show to prove he can meditate for 5 hours. The idea that someone with any type of ability strives - first and foremost - for a public recognition, fame and money, is astonishing. Especially media is something to avoid, in any profession really. My husband has lots of media request due to being an expert on something (no matter what) - just last week the BBC called him twice, and he declines, as he does not want NOR NEED any public exposure. Now can you imagine you have some unusual ability - whatever it would be - would you really rush to show it off to the world for a mere 1 million dollar? For any money, really?

Q1: Let's say you are giving a donation to charity - are you interested in showing off and telling everyone what you've done, or is it enough for you you are helping? That's a horrible comparison.

Going with a hypothetical 'paranormal' power to Rabdi would be like Dalailama going on a TV reality show to prove he can meditate for 5 hours.

Are you on acid? At least you admittedly align yourself with Randi's guests and seemingly google "randi debunked"

The idea that someone with any type of ability strives - first and foremost - for a public recognition, fame and money, is astonishing. Especially media is something to avoid, in any profession really. My husband has lots of media request due to being an expert on something (no matter what) - just last week the BBC called him twice, and he declines, as he does not want NOR NEED any public exposure.

What exactly does your husband do? What field of study is he an expert in? Also, to anyone else reading, remember that Louis Theroux invites guests on the BBC all the time. Not for public recognition, but to help society. Frankly, it would be more likely that one would hide in fear due to thinking the conspiracy shadow government was out to get them. To keep theme with the Kettle Logic... The real heroes are just regular people. Doctors, scientists, Inventors, Paramedics, Counselors, Social Workers, Bus Drivers, Tow Truck Operators. Spies. Soldiers. Musicians. Artists. TV host Illusionists. This quackery, to me, is akin to religious ignorance. "Pray the disease away" "Allahu Akbar" "A woman does not own her right to choose whether to abort a baby to prevent illness, nor shall she choose her husband"

Would your magical superheroes not be able to help more people if they were exposed to those who need help? Unless they regularly visit the hospital or mental ward. After all, finances, health and personal lives all converge there the most, with the most in need of help often there. Sad part is, I'm pointing out how seemingly kind and vulnerable people like you can be manipulated into quackery. That's the reason I speak out.

A5: Are YOU on acid? The only thing I said in my original post was that - theoretically - the fact that someone has 'paranormal powers (in which I DO NOT believe) does not AUTOMATICALLY follow they would want to advertise them anywhere. I know that IF I had any 'powers' (in which, let me repeat, I do NOT believe, the last thing I would do is to admit them, advertise them, draw attention to myself, and be interested in cashing on them for a mere half a million quid. What is there not to understand?

Your obsession with Louis Theroux and James Randi is really odd. Especially since you seem to misunderstand the first (he is not on the mission you think him to be, and he is a journalist-entertainer really), and have an elevated impression of the second (with no scientific credentials and a history of untrustworthiness, he is only qualified to 'debunk' illusionists, as a skeptic-entertainer). Why those two? If you are on the skeptic/rationalist path there are better figures to follow, if following people is your thing, which it seems to be. I'm not sure what the real reason is that you "speak out", but since it mostly consists of random disconnected points, and there's no coherent argument even vaguely related to, for instance, the topic of this subreddit, it's unlikely you are going to help anyone by doing it. Your comments here and elsewhere consist of an antagonistic stream of uninformed ranting, personal attacks, non-sequiters involving the words "Theroux" and "Randi", and even paranoid delusions. I seriously hope nobody who is vulnerable ends up anywhere on your radar, the unfortunate target for your emotional release. Everyone is polite in response, of course, because it is natural to feel sympathy once the initial amusement has faded, but I have to wonder - if this is how you respond to a bit of playful experimental metaphysics, who knows how you'd respond if you took the time to do some actual reading in science and philosophy and inform yourself about things - maybe even find out about proper skepticism - rather than watching media personalities! It's meant to be all about having dialogues, don't you know.

(Yeah, I realise you're not actually interested in being serious, but it's become interesting to **watch you dodge the content of people's comments and post disconnected sentences in response**, claiming victory in an argument nobody's having except you.)

Q1: Proof that you are narcissistic to the point of thinking you are a doctor. Once again projecting your avoidance, quackery and hypocrisy. So how old are you and when did you make up these exercises? Are you a metaphysicist, doctor or philosopher? Where are your credentials? Do you accept responsibility if you mislead anyone or caused anyone to avoid real medicine, science and philosophy? Do you pm people who subscribe here, offering advice and counseling without credentials? How many alts do you have on here? How does the bullshit here relate to the other subs you mod? What is your job outside of reddit? Seems like philosophy and science are merely excuses for your lack of credentials. Do you see any long terms risks for those who might be misled and consume your quackery?

Okay, so you still don't get it, even now. And so you can't actually discuss the topic or criticise it on its own terms (which would be fun), because you don't actually know what you are attacking. Hence your own ignoring of any of the points people raise during the discussion. If you haven't already, you should read this earlier comment which pretty much sums it up, in terms of history and content (including the origin of the subreddit name). There is nothing very new or controversial there, in terms of philosophical ideas; they are not new concepts. The only addition is exploring of the implications of it, by experiment. What one then does with that, and what one uses as the subject, is up to the individual - as are the conclusions one draws. Fundamentally, the problem here might be that you are just not an abstract thinker. Everyone else seems to get it, except you, since you seem to have brought some sort of strange template with you and overlaid it upon everything. You are applying a delusional idea of what this subreddit is, to what's basically discussion forum with a (potentially practical) philosophical theme. Meanwhile, of course I'm not going to start giving out personal info, especially not to someone like yourself. For your curiosity: my background is in science and technology - but that is not relevant here, because this is a discussion forum about exploring a particular set of ideas to see where they lead, to be taken on their own merits. It is not relevant because: the whole thrust of this subreddit is the idea that people make judgements based on their own experiences no matter what the topic, applying their own thinking, and not on what anyone says. That means me or you or any authority figure, regardless of their credentials. It's actually a concern to me that you elevate the people you do, and are advocating others use them as their baseline for truth. Everyone is just people; including prominent figures in religion, science, philosophy, sociology; even journalist-entertainers, skeptic-entertainers, etc. For instance, eugenics was practiced in the USA until WW2 (it was actually the template for the Nazi program), including the passage of compulsory sterilisation laws, and was accepted as fact and taught in universities across the country. It was seen as scientifically validated. Prominent figures of authority advocated it. Would you have been defending that at the time? Given your tenuous knowledge and tendency to follow, I suspect so! (Okay, I'm just having a bit of fun with you there.)

You've got me curious though: What makes you think people are posting under alts? Where do you get the idea that anyone advocates the avoidance of science, medicine and philosophy? Why are you so obsessed with me in particular? Are you under the impression that being a moderator = agreement with all comments? And again: what exactly do you think the topic of this subreddit is, given that your comments don't seem to match up to it?

(Man, I just couldn't resist replying; too fascinating.)

Q1: Okay, so you still don't get it, even now.

Redundant. Also, what is "it"? Insane amounts of projection as usual... let's see what the walking fallacy has for me today. Noticed you didn't answer any of my questions. Again. For the Seventh time. What are you hiding? Are you afraid that certain questions might reveal facts about you which would turn vulnerable people away from being taken advantage of by you to satiate your messiah complex?

For instance, eugenics was practiced in the USA until WW2 (it was actually the template for the Nazi program), including the passage of compulsory sterilisation laws, and was accepted as fact and taught in universities across the country. It was seen as scientifically validated.

Wow, I think you've covered every fallacy. The complied list of unanswered questions and fallacies you've committed is going to be amazing.

(Man, I just couldn't resist replying; too fascinating.)

What's fascinating? Attempting to belittle someone, but actually making yourself look like a spineless douche?

Are you under the impression that being a moderator = agreement with all comments?

All it takes is time to get a megalomaniac to reveal themselves as mentally ill. No particular diagnosis, I'm unqualified.

Why are you so obsessed with me in particular?

lol. You flatter yourself and at the same time attempt to belittle me, yet another beautiful unwitting microcosm you create of this overall dialogue. I'm guessing Randi and Theroux (my other obsessions, correct? Because I've spoken about them to you only in this sub for less than a month.) If you've been speaking about your quackery and yourself for longer, according to your logic are you not obsessed with yourself? Not only are you a blowhard and one who seeks to validate themselves with buzzwords, but you are a misleading coward and science (along with actual philosophy) fundamentally are not compatible with your self-centered wannabe cult guidance. Richard Dawkins. Opinions?

In this thread and the initial one, in your responses to myself and others, all you've done is attempt to attack the commenter, and appeal to authority, rather than engage with the topic. You have been content-free throughout. In fact, I don't think you've responded to any point or presented any view. I guess that's one way to avoid making a fallacious argument - never make an argument at all. :-)

I suppose you are trying to go for the "discredit the author" route, following what you perceive to be the Theroux-Randi™ template. But what would that achieve, with me or anyone else? It would leave the actual ideas intact, to be taken on their own merit (or lack of, as the reader saw fit). Ideas which predate this subreddit, a subreddit which emphasises thinking for yourself, and taking nothing on trust. Perhaps you do not understand what is being discussed, and so can't participate. Have you even read Berkeley yet? Perhaps this is just an emotional release for you, a need to "win" no matter whether it makes sense or not. In other words, for you this is about your very identity, and that's why you are showing signs of paranoia and hysteria. (I say this from a layman's point of view of course; I am not a medical doctor.) Nobody needs to belittle you; at the moment you have effectively dismissed yourself with your approach.

Richard Dawkins - He was an excellent biologist, then a mediocre philosopher, and now he's a poor social commentator. Why are you letting yourself be distracted by these media figures who are presented as "crusaders"? You are just wasting time that would be better spent focusing on reading deeply, exploring ideas, and thinking for yourself. Or if this is not actually about the ideas at all...

On the other hand, perhaps your concern has nothing to do with science and philosophy as such - rather, you are worried that broader society might be going in a direction you don't like. Religion's influence in politics, non-evidence-based approaches to policy, that sort of thing. With that I have sympathy. But it would be a mistake, I say, to think that replacing all the god-believers or new-age-followers with scientists and engineers would transform things for the better necessarily. After all, in theory all the Christians in the US and other institutions should have been working for the wellbeing of their fellow man; that's not how it has played out though. With a completely amoral structure in place based on logical reasoning and scientific modelling, we might make decisions better, but we won't necessarily make better decisions. So, it would make things more efficient, perhaps, but the political goals probably wouldn't change; the country's control infrastructure would remain nearly identical, it's just the methods that would shift. We might ultimately end up with something like a technocracy (in the original sense):

The term technocracy was originally used to advocate the application of the scientific method to solving social problems. According to the proponents of this concept, the role of money, economic values, and moralistic control mechanisms would be eliminated altogether if and when this form of social control should ever be implemented in a continental area endowed with enough natural resources, technically trained personnel, and installed industrial equipment. In such an arrangement, concern would be given to sustainability within the resource base, instead of monetary profitability, so as to ensure continued operation of all social-industrial functions into the indefinite future. Technical and leadership skills would be selected on the basis of specialized knowledge and performance, rather than democratic election by those without such knowledge or skill deemed necessary.

In fact, in the UK there have already been moves towards this with the Behavioural Insights Team - see recent article in Wired, which asks "who nudges the nudgers?" - which one might see as the natural evolution of Edward Bernay's work on population management, and extending the remit of ongoing data collection from being specific to anti-terrorism and serious crime, to now include "economic wellbeing". Similar data and analysis projects are running in many countries, dating back to the early 2000s and TIA, so this is the way things are going eventually, I'd say. All of which makes logical sense of course: it's obviously more efficient to get everything integrated into databases and set up automated rules and alerts, with algorithms designed by "nudging" teams, in alignment with the policies of government and associated agencies. So if you wait a while, all this stuff about people believing in things you view as foolish might not matter - personal beliefs will eventually no longer be able to have much influence over behaviour in a social and economic context anyway. You know, if that is your bag, if you are concerned about science vs woo and how beliefs affect how things are run, then you might really enjoy reading some Paul Feyerabend, such as Farewell to Reason, which explores the relationship between how science is actually conducted, and society at large. Even if you disagree with him on many points, and it's likely you will, it is still very thought-provoking and great for clarifying your own views.

Discredit the "author"? You wrote a few paragraphs, posted them on reddit and promoted the shit out of it with alts.

Ha, I really meant it more as a general term rather than a personal reference, although we shouldn't give reddit any ideas: it'll start advertising itself as the home of "100 million published authors" before we know it...

Skuuuuurt! Redirect!

It was a sincere change of tack to see where you were coming from, actually, which is why I bolded it. And there are genuine concerns here, I feel, about what is accepted without skepticism by the population at large (this applies as much to science, psychology, medicine as 'woo', perhaps more so) and then applied as political or economic solutions. Science is amoral, I'd say, but in the political sphere science and technology are being treated as inherently good, which circumvents our ability to apply critical thinking to things. The frustration I feel about the misuse of knowledge and the misrepresentation of science and philosophy as processes and conceptual frameworks is similar to how you expressed your side of our discussion; I just dial it back.

In the end, I do apologize if I attacked your character. Only if you aren't using alts to promote this site/vote manipulate/etc.

No problem - apologies if I've been a little too "provocative" sometimes. Yeah, there's really not alts or voting stuff going on here (not by me anyway). It would kinda ruin the point, which is to have people explore a certain philosophical perspective, without actually having bought into it. The sidebar really does lay it out: it's taking philosophical idealism as the starting point, and exploring how actively adopting metaphors "patterns" experience and filters intention, and seeing what the effects are, without presuming anything. It tries to be "worldview-free" other than a basic notion that experience can be described as a dumb patterning system. The beneficial aspect of any outcomes are (useful?) side-effects really.

I see a huge danger in an "exercise" that requires the practitioner to at least somewhat accept some form of fallacy in their life.

It's something to be cautious of, definitely. The exercise itself tries to completely avoid suggesting either the nature of the exercise, or the type of outcome - while warning not to treat it lightly (because you do tend to get some sort of result, even if we interpret that as apparent coincidences and selective perception). In other words, to avoid any tendency to fallacy. It's a bit of a double-edged sword, this, because of course despite the intention to prevent it, people inevitably bring their own worldviews to it.

[replacing all the god-believers or new-age-followers with scientists and engineers] Another introspective piece into your emotions. You feel threatened by me. I don't want you replaced, I just want you to be more responsible.

Actually, I was putting myself on the side of the scientists and engineers there!

Anyway, some good has come of our exchange, because it's resurrected the discussion about the subreddit's name and all its baggage (which is historical accident - it really did begin as that mirror technique thing before it gradually morphed into this), and the idea of having one that's more appropriate to the actual topic, of which "dimensional jumping" is just the most provocative metaphor.

Now I'm convinced that you are an AI running a Behavioural Insights exercise on Reddit.

Haha, rumbled! :-)

Thank you for engaging in dialogue and not banning me. Thank you for offering at least some of your material ,which some people find to be great, for free.

Without dialogue across boundaries, we're fucked I'd say, so it's all good. Well, if people find it useful that's great, but to be honest it's just me exploring my thoughts on a certain angle; I'd be bemused if someone actually wanted to pay for it, considering they can just browse reddit while sipping a glass of water instead... :-)

Cheers. (That was classic Wesley by the way.)

...

A1: Dude, check out the sidebar. There's even a whole section titled Active Metaphors. The point of this sub is pretty transparent. No one is selling anything. But don't worry, I too once believed this was actually about jumping to alternate dimensions, until I did more research and absorbed all the information contained over there =>. You should check it out! Otherwise, you aren't really exposing anything. All you're doing is giving a good laugh.

A2: Exactly. Lack of abstract thinking is a plague really. This is the same with religion - lots of people who cannot understand symbolic thinking take things too literally and jump up and down.

A1: *when they should seek actual counseling.*

Well, I actually sought therapy earlier this year for anxiety and depression, and indeed was seeing a therapist for a couple of months. It didn't work out for me. Then I discovered this sub, and started taking responsibility for my life. I'm not saying the ideas presented here will cure anxiety or whatever. But they can have and have had a positive effect on people. If changing my life for the better (without actually believing in anything) makes you think I'm being cultish, then so be it ;D

POST: Holy. Crap. Two Glasses Works...I Think. TV Show Changed Network.

Q1: Oddly enough, I was a huge skeptic of this. I did the experiment a week ago and 2 different shows I've watched for many years are now on a new station. My result hasn't come yet, but when I first noticed this change it was very odd.

Q2: Correlation does not equal causation. To assign a causal relation to the data is simply a fallacy. Just know that you are being vulnerable, and people will attempt to take advantage of that.

An excellent point. Causation is an aspect of a particular description, and not of any set of observations. It is an interpretation. More importantly, the road from coincidence to correlation is a long one. If the aim is to discover more about how the world apparently works and codify it, then repeating an experiment is the only way to discount confirmation bias and the like, and avoid the temptation to attribute every change to a previous act. Replicate the results!

Q2: An excellent point. (act neutral, pay a fake compliment, cliché and generic) Causation is an aspect of a particular description, and not of any set of observations. It is an interpretation. (release the horse dung and sprinkle some buzzwords on top! You should be a politician. Maybe write for Donald Trump. You'd kill it. You'd have to teach him your godlike redirection skills, though.

Well, you made a decent point but, since it was a bit of of buzzword phrasing which might not mean a lot out of context - i.e. causality in the sense of physics or philosophy or common use? - I thought I'd add some. It matters whether we are treating "cause" as in the sense of an inherent relation, or part of an explanation:

In physics it is helpful to interpret certain terms of a physical theory as causes and other terms as effects... For different physical theories the notions of cause and effect may be different... So what constitutes a "cause" and what constitutes an "effect" depends on the total system of explanation in which the putative causal sequence is embedded.
-- Wikipedia: Causality (physics)

As for the rest, not everyone spends their time viewing things in terms of a battle or political argument, you know. Some people are just interested in exploring ideas with other curious people (minus the snark).

Is it possible to get someone banned from a subreddit? This fellow (AthleticsTix) has been quite the nuisance recently.

Apart from this little exchange, his participation has recently been limited to the two threads he began: recently here [POST: How many of you know that this is just a metaphor and not a substitute for Science-based medicine and counseling? If anyone tries to sell you anything, don't buy it. It is a scam.], originally here [POST: Do you need to drink all the water to jump?]. And those threads are now closed, as far as I'm concerned. I felt I should at least see those discussions through, just to allow a contrary - even antagonistic - position to play out, and allow people to make their own judgements.

Q3: It isn't dissent or a differing of opinion that I mind, but the antagonism is a bit jarring, you know? There's a bunch of people exchanging and comparing ideas, discussing how they're different and similar and encouraging each other to experiment, and then there's one asshole just standing around shouting that all the rest are idiots, you know? Basically I generally view this sub as a library, where people are free to exchange ideas in peace, and this guy is the guy who's being loud and distracting everyone.

Yeah, I completely agree. Differing views are (more than) fine, that's part of sharing our insights; fighting to "win" without actually contributing, is not. People who do that and get reported end up on the spam list for pre-approval. I let that one run a bit in his own thread because he'd done a cross post to /r/skeptic, and it gave folk an opportunity to voice their own "meta" view on the subreddit, if desired. Normally the mods wouldn't let that stuff run.

POST: What is the difference between /r/Oneirosophy and /r/DimensionalJumping?

Firstly, I'd suggest that the premise is probably better phrased as something like: "a mind takes on the shape of reality", since it is not necessarily a personal mind or a personal reality. It is the experiential content that is of being-a-person; the nature of experiencing is itself not necessarily personal. But with that little bit of pedantry behind us...

We might vaguely define them as:

- **/r/oneirosophy** is broadly focused on having quite involved philosophical discussions about the nature of experience, morals and ethics, and so on, all rooted in the perspective of subjective idealism.
- **/r/dimensionaljumping** is narrowly focused on the practical exploration of direct experience, employing specific metaphors and exercises, and not necessarily requiring idealism as such, subjective or otherwise.

Loosely, the shift of this subreddit from mirror fun to something more developed is based on the metaphor of "patterning" as partly outlined in this post from /r/oneirosophy [The Patterning of Experience], which is linked in the intro post here. Although an important part of this is: exploring direct experience should not require the adoption of any particular metaphor, hence the demo exercise descriptions are fairly devoid of background explanation. Experiences are primary; explanations are secondary.

...

It's all witchcraft!

What? To the ducking stool with /u/ManipulativeMinds! Or to the wicker man! (And it'll be the remake, too; there is no mercy here.)

POST: Is dimensional jumping and "manifesting" using the law of attraction the same thing?

Well, the same fundamental "truth" underlies all of experience, even everyday boring grocery shopping, so everything is of course kinda of the "same thing" in a way. So yes, definitely. The "dimensional jumping" concept of this subreddit is (see sidebar) one of several metaphors for creating change in your experience. You are not literally changing dimensions - as in, switching to other "places" - you are really changing your own state. The difference between here and things like LoA is that here this is done knowingly, you pick your metaphor. But that's just because it includes a certain philosophical angle, which arises from asking the question: how, exactly, does intention and thought relate to experience?

But in the end it's a case of whatever works for you. Many people prefer to continue to view the world the same way (as a "spatially-extended place unfolding in time") and think of things are being "attracted" to them, and not think too deeply about what that actually means. Because what it potentially means is, the world isn't really a "place" at all and you are not really a "person". That's not somewhere that everyone wants to go. Having a clear model, though, does give you a definite structure to work within, beyond just trying to "raise your vibration" and so on. And the structure you select also formats your experience simply by its adoption, meaning you both create the path and identify the means of traversing it, simultaneously.

Related: The Patterning of Experience

Copy-pasting a previous comment which provides context -

Yeah, the sub's naming is a historical accident really, as reflected in the intro post. Initially it wasn't really "about" what it's become about - that is, having fun exploring the nature of experience for curiosity and utility - and although it's a quirky and provocative name, it does make the initial impression misleading for the casual reader (or the skeptic who isn't a skeptic and is looking for a fight). But on the other hand perhaps a strong and engaging image gets people thinking in a way that a more dry or abstract presentation would not. At its core, we're talking about the ultimate skepticism: identify exactly what you are sure of, treat that and only that as fundamentally true, and absolutely everything else as only relatively true. And what you are certain of is one thing, although it is more easily stated in two parts:

1. That you exist (you are aware).
2. That you are having an experience (you are aware of content).

Anything beyond that is about the content of experience, and is up for grabs, and we treat all descriptions of that as provisional, as a convenient or useful or interesting or fun fiction only. (Note - It is useful to assert a basic level of form to experience though, and say that by default we are an "open aware perceptual space" in which experiences arise, or which "takes on the shape of" experiences. This gives us a ground or reference point for discussion and exploration.)

For instance, take the assumption that "the world" is of the same format as our experience. Although our experiences may arise in the form of a 3D-formatted spatial scene, that doesn't mean "the world" is of that format, that it is a "spatially-extended place unfolding in time". Unfortunately though, our thoughts are also formatted in this way (they are experiences too) so it's not really possible to think beyond this. However, we can certainly take the most generalised version of structure - we can talk of "the patterning of experience" - and, bearing this in mind, at least avoid committing to conceptual frameworks and forgetting that they are "connective fictions" only. The working model for this is to provisionally treat the world as a dimensionless "infinite gloop" from which experiences are selected, in a manner perhaps comparable to scanning our attention around a 3-dimensional room. Our investigations, then, might be said to be about exploring the nature of the "selection mechanism" and its limits. Those limits, that basic and unalterable formatting, would, if reached, be the structure of the "underlying substrate" of experience, effectively a combination of the structuring of "mind" and "world" (one can't separate the two out). However, if no such limit was reached, then we would have to infer that there is no fixed underlying substate, and the patterning of experience is just that: accumulated habitual patterns which are subject to change. Of course, we could never make a final conclusion here. But that's okay, because this is really about freedom of thought and being skeptical of all narrative structures, based on (looping back round here) the recognition of the difference between fundamental and relative truth.

POST: Dimension jumping from one location, waking up in another

[POST]

Ok, so this guy in a forum claims he teleported himself during an unintentional dimension jump. He says he ended up in jail one night, and he intensely focused his thoughts on getting back home, day in and day out, for weeks on end, until one night he went to sleep...and woke up in his own bed. And in the new dimension, no record of the crime existed (outside of his memory). Personally, I believe that we as humans can do things that science has yet to prove, and that the true capability of the subconscious mind will never be fully understood on a strictly scientific basis. Has anyone ever heard about or experienced anything like this?

Here's the link to the forum thread: [<http://www.abovetopsecret.com/forum/thread482928/pg1>]

[END OF POST]

It makes for a nice thought experiment anyway. If what you truly are is something like an "imagination room", then what's the difference between changing your experience from being-sat-on-a-chair to being-stood-up, and changing it from being-in-London to being-in-New-York? In the example in the thread, it's not just that he would have teleported away from jail though. It's more that the world shifted such that the jail events never happened at all. Apparent history fell into line with his new state. But if all you are ever doing is in effect "updating the sensory image that is within my perceptual space", and if there's no "real world" beyond this, it seems not such a massive leap. Changing direction as I walk along the street, and changing the direction of the street as a I walk, are the same: you are overcoming a habit of perception, rather than changing a solid independent place.

Q1: This is the type of mega jump that I'm going for. I've been visualizing specific realities that I want to see happen for a few months now, and recently, I've begun programming my subconscious mind with these visualizations (and some affirmations) while in the alpha and theta states. I learned this from Harry W. Carpenter in his book, The Genie Within: Your Subconscious Mind--How It Works and How to Use It. My goal is to jump into my visualization, where the world shifted so that my visualization IS my reality and no longer just a dream, if that makes any sense at all. Thanks for the link to the matrix sub reddit; I'm going to check that out.

Okay, so - have you been lucid dreaming yet? If not, then I'd suggest that's where to start (read the excellent Robert Waggoner book, Lucid Dreaming: Gateway to the Inner Self, if you need background and inspiration) and experiment with "persistent realms". There's also a related subreddit: /r/LucidDreaming. Basically what you are after here is a direct-entry lucid dream. You might also play with softening up your perception in general: Overwriting Yourself. There's a more general daily exercise which you can dig out too. In fact, I'll just paste it here for general reference:

Daily Releasing Exercise

- Every day, for 10 minutes, lie down on the floor in the constructive rest position: feet flat, knees up, hands resting on abdomen, a couple of books under the head so that it feels supported. Lie down in this position and give up, play dead. Give yourself to gravity, the universe, whatever. Let go of your body, your mind and - particularly - let go of controlling your attention.
- Allow your body and mind and attentional focus to shift and move however they want. And if you happen to notice yourself "holding on" again, gripping anything, just let go once more.
- Now, sometimes you might find that your attention narrows on a particular sensation, which then intensifies, peaks, then releases, after which your attention opens out again. That is fine. Just let that happen. Let anything happen, for those 10 minutes.

The idea is that over time you'll have an open and self-supporting rest state, and you won't continually "thrash your world" by intending change all the time during the course of your day.

TG, you are amazing with the resources. Thanks a ton! How long have you been studying this stuff? You seem to have an answer for everything, lol.

The wider thing, quite a while. I kinda ramped it up for the last year though, bringing things together, trying to nail the descriptions fully.

No, I haven't started lucid dreaming yet, but it's been a goal of mine for awhile. I'll start with your recommendation. Eventually, I want to get to a point where I can simply command my subconscious mind to lucid dream before I fall asleep at night.

Well, that's pretty much how it will play out. You'll mess around with techniques, perhaps, but then you'll realise that, as with the rest of this stuff, there's no real way to do anything. It comes down to firmly deciding. So I suggest: just immerse yourself in reading about it and contemplating it from the perspective of being a lucid dreamer (rather than thinking about "how will I become a lucid dreamer?"), and take it from there.

Q1: Definitely. The more I learn about this stuff, the more I realize that all roads lead to awareness, and it's just finding out which road(s) you prefer to cruise on. I really like the idea of just deciding. I strongly believe in my own abilities, and firmly deciding that something will happen because I've declared it so is exhilarating. On the downside, this mindset may inflate my ego to epic proportions, but that's a chance I'm willing to take. :-)
On a side note, one of the reasons I believe these concepts are possible is because I've watched a lot of NDE videos and read their testimonials, and many of these folks have talked about effortlessly teleporting themselves and instantly manifesting thoughts into things while they were out-of-the-body. So I always thought, if we can perform these feats on the spiritual plane, why not on the earthly one?

Well, there's nothing wrong with little bit of ego! Although actually: the key to "just deciding" is to cease interfering with the sensory experience that are arising in your

awareness, since to interfere is to re-intend against what you have decided. If you like NDE testimonial stuff, you might be interested in the NDERF site which collects these. Not all of them are strictly what people tend to think of as NDEs, and those ones tend to be the more interesting. For example: this one. One way to think about it: no matter what happens, there's just... more dream. There are two aspects: the fundamental nature of experiencing, and the content of experiencing. You never go anywhere or are anything, not really; rather you just have experiences "as if" things were true. This means that there are no paths to understanding, in the sense that the path doesn't really cause or lead to understanding... it's just a sequence of experience you happen to have, prior to understanding (which is itself not a particular experience, but rather is the recognition of what all experiences are). Actually, the true concept of this subreddit (now anyway) is that. It is about exploring what can be done, and in the process becoming clearer about how things are.

...

To be clearer: "reality" is just a concept, there is only experiencing. Those look interesting too - thanks. Just from a quick glance, I notice a reference to Robert Monroe in the first one, which reminds me that you might find Donald DeGracia's free DO_OBE guide worth a look too (although I don't really agree with some of his perspectives). On the "open perceptual space" thing, remember that it is you that is the open space, and being-a-person-on-a-planet is just experiential content appearing within it. To emphasise: you are not a person in an open space, you are an open space having an experiencing-a-world-from-the-perspective-of-a-person shaped experience. You are like a blanket of material that "takes on the shape of" a particular set of facts, adopts a particular state, and experiences itself as a particular set of sensory impressions in correspondence with those facts, or state. (Hence the imagination room metaphor, which should actually be taken almost literally.)

I've also heard it phrased as "We are spiritual beings having a human experience."

Well in truth, there is no definite way to express it, because it is "before" words. So what we typically end up doing is exchanging a few different versions of a definition, to make sure we're talking about the same thing - just like this! We're really talking about being something that has no innate form, but which takes on the form of any experience. Not an easy thing to choose a name for!

Can you imagine the magnitude of scientific discoveries that would exist if these beliefs were mainstream? Hmm...maybe I should lucid dream myself into a world where everyone is more aware to see how that plays out...

Do you see the irony?? Fun, this.

You mean the idea of using metaphysical, "unproven" concepts to further advance science? Ha. If that's what you meant, I didn't see the irony...until you pointed it out. :-)

Indeed! :-)

So your plan is: To create a world where people are making amazing "scientific discoveries"... by believing in them. It's a bit like being in a dream and deciding to dream about building a factory, then dream about hiring some people, and dream about doing the accounts and getting the tax sorted - all so that you can then dream that the factory makes nice dream objects which you want to exist in your dream. Rather than, y'know, just dreaming the objects into existence directly.

I actually think the hardline view of "if it can't be studied by the scientific method then it's not real" is relatively recent, having begun post-WW2 and ramped up since the 1970s. Popular science magazines - not to mention funding applications - tend to misrepresent what science is. Prior to WW2, the major physicists, the groundbreaking ones, recognised what they were actually doing. That is, not discovering how things were, but developing descriptions for a certain subset of subjective experience. For example, Neils Bohr:

"We must be clear that when it comes to atoms, language can be used only as in poetry. The poet, too, is not nearly so concerned with describing facts as with creating images and establishing mental connections."

Nowadays, people tend to look upon the other activities of those scientists, and before them, the likes of Newton, and think that they "lost it" later in their career, or just ignore the fact that many of them were engaged in metaphysical explorations at the same time as their scientific work. These scientists were more like "natural philosophers", exploring the experience while recognising mystery. They knew they weren't really explaining "how things really are", rather they were cataloguing and describing repeatable observations. They didn't not mistake their abstractions for an underlying reality. See: N David Mermin's What's bad about this habit

So, looping back: yes indeed, we need to return to a place where people trust their own subjective experience, because really there is no other thing. There is no objective world, that's just a conceptual container into which we have put a subset of the possible experiences we can have. We need to remember:

- Observations define the possible models.
- Models do not define the possible observations.

Although as we discuss sometimes in this subreddit, models or metaphors can act as a "patterning" over your experience - but understanding that already requires a certain openness to these points.

Q3: *Basically what you are after here is a direct-entry lucid dream. But a WILD is still a dream, right? Eventually, I'd have to wake up. My goal is to achieve what the dude in the thread accomplished, but to intentionally, and permanently, step into a new reality, where the external world shifted around this reality.*

What I am suggesting: you enter a lucid dream and never come back. Consider, perhaps: what is the difference between lucid dream and waking life? Isn't it just that you wake up? This makes more sense once you've actually had lucid dreams. Also: You have never experienced an "external world". That's just an idea you have about the nature of experience. Everything you ever experience, including thoughts about an external world, arises within the "open aware perceptual space" that you actually are (this is easy to realise after a moment's pause to examine - note: examine, not think about - your experience right now). Basically. I mean, **you are always "dreaming"** in the sense that you are experiencing sensory shapes arising in your awareness, with no "outside" to that awareness. The only reason you differentiate between waking and sleeping, just as your differentiate between internal and external, is because you've ended up with a particular idea about it, which does not really hold up to examination. Specifically, you only think this is the default experience because you have likely conceived of things in terms of hierarchies and levels, and because you can't remember anything before this sequence of content.

...

Yes! Your observation so reminds me of this scene from The Matrix ["There is no spoon"]

Ha, quite. That's why I have to eat soup with a fork.

POST: Is there a negative side to dimension jumping?

Well, only in the sense that there's a negative side to making any decision, since you can't have a change in your life without there being some changes. You'd perhaps be better phrasing the question as: "Will there be collateral changes as a result of this?" - and the answer is of course: "yes". If the world is a single pattern, like a blanket of material, then you can't pull on one of the folds to reshape it without tugging on the other folds, even if just slightly. However, such "collateral shifts" are neither good nor bad. In fact, though they are caused by your change, they may not be logically connected to the decision you make. You get a promotion, and an extra tin of peaches appears in your mother's kitchen cupboard. In general, though, you might find it comforting to have a side intention when you do an exercise - something along the lines of "for the good of everyone" or something similar. That way, you are making explicit that, for example, you don't want to get the promotion due to your boss being attacked by an escaped lion in his apartment complex, but rather that he'll leave his job to become a lion tamer, the fulfilment of a childhood dream.

TriumphantGeorge Compendium - Part 6

POST: Help me understand

Some thoughts -

I attributed a lot of their experiences to drug use

That's probably a little insulting, since there's no reference to drug use in the vast majority of posts. However, it's obviously a possibility to consider when reading unusual reports.

EDIT: We should also note that not all reports are necessarily of the same type. For example, one shouldn't conflate discussion about the header number with the larger topic of experiential change. Also, if people don't take the time to read the sidebar and the sticky posts, they'll probably get the wrong idea about things. This happens quite often.

Confirmation bias perhaps?

As always, the only way to counter this is to perform repeated experiments, as with any area related to personal experience and without an observable sequence of events. And the more specific someone is about an outcome, the less likely that broadly related experiences are going to be interpreted as "results". It's not really a case of "positive thinking vs sitting on your ass" for a gold medal though, since this isn't an exploration of positive thinking, you probably do sit on your ass afterwards, and the recommended type of situation to experiment with is one that isn't directly under your influence.

Can you say with certainty you're experiencing something different than my thought process of the situation?

Your thought process seems to amount to "drugs or memory or confirmation bias", which isn't much of a theory, more a list of categories. I guess we'd really need to take particular cases and show how exactly those potential explanations account for an experience. You'd probably need to say what you think "dimensional jumping" actually is - not its mechanism, just what it is proposed to be - so that you and they were operating from the same concept. For instance, the concept does not involve literally teleporting from one place to another. The general concept is that it's a shift of state, but again that's just a way of thinking about it. There is no "how it works" really. That's why it's fun to play with. It should be noted that the spirit of the subreddit is one of exploring the nature of your experience, and drawing your own conclusions. This isn't something to "believe in", it's an exploration of the level of flexibility of our ongoing experience, and how explanatory frameworks relate to that - be they physical, psychological, metaphysical, whatever.

It's surprisingly easy to trick your brain into experiencing things such as outer body experiences, events that didn't occur, etc.

That is the equivalent of saying "maybe you are just imagining things". We could apply that to absolutely everything you've ever experienced and any claims you have to being conscious, for example. Again, repeated experiments would be the answer. If you could (for example) "trick your brain" into experiencing something reliably, and the rest of the world stayed consistent with the trick - in what sense would it be a trick?

Again, general statements like this aren't explanations, they're a bit meaningless without context.

Correct me if I'm wrong but based on my understanding of this theory reality is merely my illusion.

I'm not sure that it does. Broadly speaking, the subreddit encourages exploring the nature of experiencing to see whether it is consistent with your assumptions. If your assumptions about that turn out to have been incorrect, does that make "reality" an illusion? Or does it just mean you were thinking about it wrong? (More later.)

It's important to not confuse your ideas about the world with the world itself. Although for convenience we tend to assume our explanations and description to be the world, they are just parallel constructions in thought. They are not barriers to what can be experienced, nor do they really tell you what it is you experienced. They just provide a way of thinking about it, based on a catalogue of a particular subset of experiences to date.

Do you exist or did I create you? If not, then why does this subreddit exist if I don't believe in it?

What do we mean by "exist"? And aren't we making the assumption that if reality is an illusion, or a private subjective affair, that it necessarily means deliberate creation of things by conscious decision-making - rather than, say, triggering by logical implication?

And I suppose, what do we mean by "reality"? Do we mean "all that is"? Then it's pretty meaningless. Do you instead mean that the experience of the world as "a spatially-extended place unfolding in time" is an illusion? Well, in the sense that the world might not be "stored" in that form - that the format of our sensory experience isn't necessarily the format of the world - I suppose that's true.

Anyway - Interesting points to raise! Fundamentally though, none of it much matters, in the sense that one actually has to do some experiments and satisfy oneself whether there is "something going on" or not - directly. People could offer another logical scheme to think from (for instance, one based around philosophical idealism), but that wouldn't really confirm anything. It doesn't much matter whether it makes logical sense in advance or not - because the world is not made from explanations. This means that nobody can prove anything to you. Which does mean taking a bit of a leap, since if something doesn't seem possible or even desirable, why bother? It's up to the individual to decide if they care enough.

I was simply stating from a statistical standpoint that the majority of users I tend to view post in psychedelic subreddits.

That is an interesting correlation (I didn't realise you were referring to post histories outside this sub). I'd tend to view it as showing that people interested in "the nature of things" probably end up exploring, reading about if not participating in, similar topics. For example, /r/psychonaut often has lots of thought-provoking posts where people ponder their experiences (although personally I've never dabbled in psychoactive substances). What's important here, though, is that the experiences do not occur while under the influence of drugs. In terms of the experiments people have tried out here, it's very much recommended to have a clear mind, unencumbered by anything. Drugs probably wouldn't explain any results, though, which tend to be in the form of subsequent events or changes, unless we're talking about heavy use affecting people's perceptions more generally on an ongoing basis.

I'm not trying to be some judgmental prick.

Well, sometimes that can be fun too, of course...

I really don't understand the bit about the gold medal. I'm referencing the overwhelming amount of positive feedback in this subreddit and why I figure that occurs. What isn't an exploration of positive thinking?

Well, "positive thinking" has a particular meaning to most people, which doesn't correspond to what this (dimensional jumping) is supposed to be about. Of course, positive thinking may indeed make you more inclined to interpret fortuitous changes as being due to "jumping", or more inclined to take action.

Now, did I receive the job because I shifted realities or would I still have been hired if I didn't file the application?

And, indeed, would you have got the gold medal if you didn't do all that training? That's why the race and the job application are not necessarily the best examples, since you are apparently influencing results by direct action anyway. The way to explore this is to generate results that are not directly under your influence, and do so repeatedly.

The drugs were an observation to posting history, flawed memory was an example to the mandela effect and confirmation bias was in relation to positive feedback.

Okay, that makes more sense! It wasn't so clear in your original post. I'm not sure that it gets us anywhere, though? It's probably a good list of things to be cautious about, I guess. Again, it's really only by repeatedly performing personal experiments that one can establish whether there is "something going on" or not - whether the experiences you are having push against the boundaries of what seems reasonable with in the usual "spatially-extended place unfolding in time" model.

In absolutely every sense. There's always a right and a wrong regardless of if we're aware of it or not.

Hmm. I don't think that's the case. We might assert that there is a right or wrong - a specific "how things are" out there - but really it's an assumption, which is perhaps based on conflating the structure our narrative constructions with the whatever-it-is that those narrative constructions are "about". Which leads us to...

I'm applying my logic to the general consensus of dimensional shifting according to this subreddit.

I'm not sure there is a general consensus? One of the ideas here is that there is perhaps no solid underlying substrate to experience, no necessarily fixed "how things work", no specific mechanism behind it all - only experiences and different ways of thinking about experiences. Fundamentally, I suppose there's the experience of "something I wanted to happen or be true, happened or become true". I'd suggest there is no "true" explanation for that experience.

Since my logic obviously can't fit in my world...

Probably a good place to start for this, would be to separate out two things:

- **The Nature of Experience:** I'm going to suggest that your actual experience in this moment, is like being an "open aware perceptual space" in which your sensory experiences arise - sensations, perceptions, thoughts - and from which they are apparently made. This "direct" truth and is available at all times.
- **The Content of Experience:** This is the set of experiences that arise within your aware space. Right now, your experience is one of being-a-person-in-a-world. All your thoughts "about" the world also appear within your awareness. Such thoughts are parallel constructions which attempt to capture certain aspects of experiential content. We never actually experience a "behind" the content, except in the sense that we recognise that it is all within and made from that aware space. "Explanations" are experiences at the same level as every other experience.

Having done that, and having confirmed this to be true by directly attending to experience, we are better placed to think about: "dimensional jumping", the possibility of certain experiences, and the best way to think of our descriptions about those experiences. Thanks for posting a good discussion-starter!

POST: I have no glass cups only Plastic!

It's not the glass as such, it's the transparency of the receptacle (so that you can see the water and see what you are doing with it). If you make labels and place them beside the locations of the cups, that will do. So long as you finish up the exercise as per the instructions, it doesn't matter what happens with the cups afterwards.

Considering how many practical questions people have about the TG method, I think you should have an edit with FAQs to the original post.

Well... really it's an exercise, not a method. Which sounds pedantic, but it's not really meant to be a tool, even though it can be used that way and getting results is part of the fun. It's meant to trigger an inquiry and a bit of contemplation, be a starting point for discussion. Pondering the mechanism after getting results (or not!) is the real purpose - and of course, there is no specific mechanism as such, to that exercise or anything else. To work through that exercise is to work through the "nature of experiencing" itself. At some point there will be a "part two", to continue the discussion. For now, though, I think it's playing out reasonably well just as it is - people are following the line of thought, suggesting their own exercises and even imagination objects, etc.

Thanks a lot, man. Will keep watching. I have yet to do the exercise. So many things to try it with. Funny thing is I am so excited of it working that I am scared to try!!

Yeah, it's weird, there's a sort of satisfaction or anticipation in the idea of these things, that sometimes makes it sort of daunting to actually do any experiments! But, that's how it becomes a thing - and overthinking stuff and making it too important probably works against progress, so get to it! :-)

POST: Problem with two glasses method.

Yes, you really have to follow the last instruction ("carry on with your life"). It's okay to have passing thoughts; just let them pass. You don't need to do anything with them, they are just random spasms in imagination, let them be and return to whatever you are doing. You don't need to deal with the thoughts. If you need something to do here, then I suggest that when you find you are narrowed down upon a thought and realise this, "release your hold" upon attention and become aware of the background space of the room. You should also do a daily releasing exercise, like the passive version of "overwriting yourself". Just 10 minutes every day, lying on the floor and giving up to gravity and "playing dead" - ceasing to hold onto your body, mind, and your attentional focus, and "being okay with whatever happens" - will work wonders.

Thanks for the response. So I basically perform the experiment, and any time I have trouble with my thoughts I should realize I need to release them and play dead every day in terms of overwriting, is that correct?

Yep, that's the way. Just as a general life thing, it is good to realise that thoughts are just passing sensory twitches from your current state; they don't need to be worked out or solved. If you have some persistent stuff, then the daily releasing will take care of it: typically, you'll find your attention drawn towards an area, a thought or sensation will increase in intensity, then it'll peak and dissolve into the background. During releasing, if you find you are "holding onto" your attention manually, you simply let go of controlling it again. Another idea you might find useful: when you do something, physically or mentally, you do not need to narrow your attention to accomplish it - you don't need to "concentrate". Instead, allow your attentional focus to stay open and to shift however it deems appropriate, and simply intend the thing you want to do. For instance: reading these words, sit back and relax, and instead of "using your eyes" or body or mind to do so, "just decide" to read the message and let it happen by itself. You don't need to "do" it, you can just sit back and let the experience come to you.

Alright, before I attempt this again, should I try for smaller shifts? (I updated my initial post so not sure if it was seen)

Yeah, I mean, why not experiment a bit? Do some stuff for fun that doesn't really matter. Then come back to larger things after having let go of them for a while. And who knows...

The demo exercises, while also valid tools, are really designed to show you that "something is going on" without putting any effort - and then "big things have small beginnings". Although it's probably inevitable, and there's no limitation (in terms of plausible but apparently very unlikely things happening), it's not ideal that people tend to have their first ever experiment be something that really, really matters.

How about in the context of getting back together, would you recommend something like acquaintances => friends => back together?

When you return to that, then it's fine to go directly, but you have to be able to let it go and let it come to you. However, if you want to do it in stages, if that's what you feel more comfortable with, that's okay. Again though, you have to let it come to you - trust that the change happens literally at the point you complete the exercise, and it's just a matter of you encountering the pre-created events that have been put in place as a result of it.

Okay, thanks for all the replies. I'm going to try in the next couple of minutes for an experience not as important. I suppose not focusing on my big problems right away will help me let them go.

Sounds good. Remember: **let the results come to you;** after the exercise, there's nothing more for you to do. (Hmm. Accidental cheesy rhyming. Jumping by Dr Seuss!)

The idea mentioned in the second and third paragraphs are same as 'Just Decide' post. You're the first guy I've come across, in my short experience, mentioning this mentality. Could you share the story of how you developed this?

Yes. The Just Decide post is sort of a "call to arms" for this approach, although it usually doesn't make much sense on its own to people without a bit of expansion in context, as in the comment above.

Some background - So, the underlying (non-)observation is that you can't really experience yourself intending as such, and think that this comes about because: a) only a particular slice of your state is unpacked into the senses at any one time, b) most of your state isn't sensory anyway, although aspects of it are. We tend to assume that what is sensory is what there is and all there is, but actually the whole state is here, now, "dissolved" into the background and accessible. Given that what we want to happen is shift our state from one configuration to another, and that state is us, then all that's required is to declare the new state, to "think unboundedly" of the outcome. Messing around by intending sensory aspects - e.g. trying to stand by summoning a state of muscle tension - is a waste of time. Such things generate an experience of effort; without them, there is no effort, simply the decision. Which leads us to the origin of it, which is relatively mundane: The realisation that you can direct your body effortlessly, and not experience yourself "doing" or "directing" at all, although you "know" you are doing so. This is touched upon in many bodywork approaches, such as the Alexander Technique, but it never really gets pinned down, since they focus on the sensory aspect, still trying to have a "causal source" in the content of experience. And that's because it doesn't make sense without the perspective of seeing yourself as an "open aware perceptual space" in which and of which experiences arise, and which is "patterned" as your world. Once you've done that, though, you can see the generality of the principle, and expand it to other things. Provided you aren't after an experience which involves world-rule-breaking, are happy for "still plausible if very unlikely circumstances" to be the route of your outcome, then "just decide" is all that's required. (Obviously, the more you work on adopting the perspective of an "open space", the more the definition of "plausible" is likely to soften.)

Summary - "Just Decide" comes from the idea that all intention is about a state change, that the entire state is always available right now, and that the aspect of the state you are changing is not necessarily in the senses. Since effort is a sensory experience, intention shouldn't be effortful unless you are intending tension. One can simply "just decide". Furthermore, from the perspective of being an "open aware perceptual space" in a particular state, there is no difference between pausing and intending an end-state of "my arm is raised in the air", and intending an end-state of "I am talking to my long-lost brother after 20 years".

POST: You can only go so far

Good topic. For me, this is why outsourcing causal power to objects (physical or imagined) is useful, since it doesn't involve de-patterning yourself so much, and you don't have to deal with the fact that everything arises in the mind as one undivided experience. You can still pretend there's a world "out there" and that somehow you magicked up some coincidences. (Although the point of things like the two glasses exercise is really to get you to ponder the nature of things, more than get results.)

I'd say that people don't really want to have their world become undivided and super-responsive to their intentions, until they have got into the habit of "ceasing". That is, allowing the ongoing moment to unfold without reacting against it (and therefore constantly re-intending), and instead settling into the idea of intending as "course correction" rather than micromanaging. Meditation or just a daily releasing exercise is a good idea for getting to a "rest state" from which you're not constantly feeling as though a movement is trying to happen to rebalancing things. To most, such movements feel like being "out of control", even though it's in fact an example of how control actually works (you intend something, the whole world moves towards that outcome as if happening to you "by itself"). Basically, we're talking about "surrender", but...

I'm not a big fan of the "higher self" concept sometimes, because I think it implies to people that you are a sort of small intelligence inside a larger intelligence, and that you are literally trying to communicate with something outside of yourself. I think it's probably more helpful to think of it like you-as-experiencer have got your attention narrowed onto a small part of the "landscape" of the world-pattern. Viewed this way, we've got an idea of what to "do". We can also see more clearly how this leads to resistance to movements arising from the larger pattern, and hence "intentional thrashing" - reacting to every thought and experience instead of letting things follow through. But however we conceive of it, there's nothing really to be "done" here; it's a non-doing, a "ceasing" as mentioned earlier. The way to widen and dissolve one's attentional focus is simply to stop controlling one's attention - with the intention of letting it open out. Get "meta" with your intentions, really? And have some faith.

Extra - The intro post has a link to this interview [<https://www.youtube.com/watch?v=2-iMw9KA93U>] with clinical psychologist Kirby Surprise (yeah), who did some research into synchronicity with his patients. It's got some great examples of how people can go a bit off the rails when their experience gets highly "patterned" without understanding what is going on.

Do you think they can stabilize by ceasing to be concerned with the external repatterning...

Yes. The sense in which you surrender is to cease to react to the content of experience, and therefore stop intensifying that particular pattern by narrowing your attention on it, because that amounts to implicitly intending its persistence. "Ceasing" in this way naturally lets things settle out. Lack of stability tends to correspond to lack of control of attentional focus, I'd suggest. Or tight attention and the attempt to control (same thing). You become swept along by the content, having lost awareness of the context, leaving you with no reference point. Ideally you'd let your attention settle out and switch your context to the "background space in which experiences arise", but failing that even just maintaining one region in awareness at all times - e.g. the lower abdomen or any other central-line spot - can provide you with a stable platform. That would be the emergency situation solution, definitely. I do think that even just being aware of what is actually happening can be sufficient to regain perspective. Knowing that you are not receiving messages from outside (leaving aside the whole idea of an "outside" for a moment), and that patterning is a normal thing, can be enough to make you realise that you are not going mad, and that the content of experience should always be taken with a pinch of salt. Experiential content should be treated as being "as if" something is true, rather than "because" something is true. People can spend years of their life wondering about these things, "discovering" new explanations and patterns in "the world", not realising that the act of looking for something implicitly triggers the experience of seeing it. And then not realising that maybe you can leverage that (once you've stopped chatting to Thor or whoever).

POST: I haven't visited this sub in a while...

What's up with these owls what's the story behind them?

Q1: Basically, you start noticing something (in this case owls) that you normally do not pay attention to, and you start seeing them everywhere (which owls are, so this is why that is easy). It is kind of like asking yourself "Hmmm, how come there aren't that many yellow cars?" Or "Have you ever seen a tall guy in a trench coat like in the movies?" And then you start being hyper-aware of these things, which makes it seem as though you are creating their existence just by being mindful of their presence. They always exist, but you are now seeing them more often- creating a false correlation between your taking notice of things and their perceived increased frequency. Blah blah blah, psychology blah blah.

Do they always exist? And if so, in what sense do they always exist, outside of their presence in sensory experience?

Q1: "I think therefore I am" can be generalized to "I see what is therefore it exists." In a purely egocentric universe where our own terms are the only force driving its existence, then it would be a valud question to consider if things really do exist even we are not perceiving that existance. If a tree falls in the woods and no one is around to hear it, did it make a noise? Yes. Our universe is self-sustaining. It does not require the mental effort of its inhabitants to uphold its laws and existence. If the universe were to become unstable, it is not caused by any flaw a being could have caused. Things exist whether or not we think of them or percieve them in any manner. If I am correct in thinking that we, as sentient beings, are all parts of a larger whole, then it is untrue that you or I could ever not be perceiving all that exists in time and space. Because we are one in the same. All that exists effects itself, like ripples in water.

I'd probably interpret "I think therefore I am" to mean something more like "the fact that I am aware of thought means that I am aware and therefore I conclude that I exist as that-which-is-aware". With that, I'm trying to get away from the notion that "seeing" (having an "unpacked" sensory experience) should be taken to be equivalent to "existing". Further thoughts -

It does not require the mental effort of its inhabitants to uphold its laws and existence.

Why should it require effort? Once a pattern is fully established, that pattern remains (or at least, it fades very slowly). While the "fact" of the tree falling at a particular time may be "true" even if someone doesn't experience it, I'd still suggest that it doesn't "happen" unless someone experiences it. So it doesn't really make a noise unless the moment of "hearing" has been attended to. Are you not perhaps equating perceiving or thinking something, with it being experiences in the format of the senses? Could it not be the case that something can be held in mind - "dissolved into the background" as it were - without it being actually seen or thought?

Q2: Basically this It's the easiest way to manifest the Baader-Meinhof phenomenon since owls are such a pervasive design feature thanks to rampant hipsterism. Owls are everywhere these days. I'd bet that just a casual stroll through Urban Outfitters would turn up owl t-shirts, notebooks, pencil sharpeners, sheet sets and maybe curtains if you're lucky. The owl seems to be a popular tattoo as well these days. I personally think the owl thing is useless, I'd be more impressed if it were something like a Dodo bird, for example.

So... people can choose something else, right? Clearly, owls are just a suggestion. The general concept and exploring the responsiveness of our experience is what's interesting to play with. We should pick something unusual, to challenge it, and repeat it with different things, to confirm it, and select something we'd like to experience, since that is the way to leverage it if it is a reliable effect. (Owls weren't particularly prevalent when the original example was made. And, well, not everyone lives in a country where Urban Outfitters and the like are dominant.)

One might then ponder how, exactly, the "Baader-Meinhof phenomenon" works - beyond it simply being a name for a particular pattern being more prevalent in one's experience (rather than a model or an explanation for pattern dominance).

POST: Tried the mirror method yesterday, starting to see signs?

[Zen vs greedy jumping]

Or, I suppose: why not both?

The larger picture is, that the things people do here are one approach to exploring "the nature of experience". Now for sure, many are just about getting a particular result, but the fact of getting that result, the manner in which it arises, can lead us to ask interesting questions. Similarly, there is not necessarily anything inherently beneficial in "connecting with the land" - other than it tends to shift your attention towards the main stand of experience (rather than thinking-about it in a whirlwind of endless attempts at problem-solving) and this may lead us to notice something about our actual experience vs what we tend to assume it is. Mirror rituals do potentially lead us to interrogate our identity - what is the reflection a reflection of? what is it inside? Even more than that, though, the ceasing of "holding on" to the identity pattern that results can give us a far more direct experience of how we are structured relative to the world. We get "desired" results and a shift in the perspective of our desire, as part of the same package.

I should probably begin by emphasising that I don't personally like the mirror ritual approach - however, it was the starting point for this subreddit, which predates my own participation here, and some people apparently find it useful. If someone is into "paths" then it can be one path like any other though, and fair enough, I suppose.

However, within the context of the conversation that led me onto this forum...

Ah. Obviously I am missing the context of your larger conversation, prior to the one that began here, but: I'm not sure how "connecting with the land" and "billions of dead people" necessarily leads to Zen understanding in terms of the eventual insight as to the nature of self and the context of experience? For sure, attending to the content of experience can lead to this, because it highlights the patterning of the world more generally, the "happening by itself" aspect to things, which can culminate in us reconsidering what we are and or relationship to the world. But it is still 'just' more content - don't you agree?

At the minimum when you are in a culture with a shamanic history, land connections are foundational to your entire understanding of how the techniques work.

The lesson we learn about "how the techniques work" is that essentially there is no "how it works" when it comes to the techniques, I'd suggest?

pretending that there aren't thousands of years of people who have done this kind of thing is foolish.

I guess there are a couple of perspectives we might have on that. In one sense, there really aren't thousands of years of people. However, regardless, the lessons of the past are only lessons if we pursue our own investigations. The surface lesson often isn't what is being pointed to, and when we interpret them literally we often miss the value. If we don't, we're just indulging in storytelling - making up parallel constructions in thought, "castles in the sky" which aren't necessarily linked to direct experience. Which is where "connecting with the land" can come in handy. (I am sharing musings with myself there more than anything else!)

you're taking out land from the equation but as soon as you get into thinking about reality it all falls apart because you are arriving at conclusions while beginning in confusion.

Not sure about this. How so?

...Okay, so I'm clearer now that you were intending to distinguish between "land traditions" and Zen (I had originally interpreted your comment as intertwining the two). Our understanding of Zen - and shamanism - does seem to match, then. I'd agree that it's highly beneficial to have something as your grounding - and that can even be the actual ground - if you are experimenting with something which, by its nature, is all about shifting everything else. Ideally, this stable context is the background awareness itself, but failing that then any persistent subset of content can serve as well. Where mirror gazing might lead to you noticing your actual situation - having the Zen insight - is that it can result in you realising the reflection over there isn't really a reflection of anything, as such. Your sense of identity then shifts from being a specific location, to the that in which all apparent locations arise. But, yeah, it's not the way I'd do it personally. Best to just look directly.

In the end, I'm using grounding to mean something similar, but perhaps broader - the underlying structure of experience itself. So, the "land" I would be referring to would be how-things-are-in-themselves, the true landscape as it were, rather than the "places" or "things" of everyday experience, which are surely just fleeting and human-formatted sensory aspects of that. Certainly, that is a land you can trust, in contrast to any thoughts-about what is (which some would call "the ego"). Perhaps we end up referring to the same thing, though, finally? But I don't think skies and forests and streams and birds are inherently grounding, except in the sense that they are more obviously spontaneous and persistent - and apparently outside of our direct grasp in contrast to our thinking selves. Is desire so bad? Certainly, we can suffer if we are identified with a desire, but otherwise there is no problem that I can see. So long as you don't mistakenly believe that "things" solve you, you're okay. I'm not sure that I see greed here though - most people who come here seeking results seem to be after an experience of something, rather than accumulation of anything. Guests are always welcome when they are so thought-provoking! The more perspectives the better - although it's true that this subreddit tends to view experiential content as, in some way, arbitrary. So, while we may agree on the relative benefits of connecting with the land in a shamanistic sense, we perhaps might not do so on the fundamental benefit.

The problem is, you are telling yourself you are "dimensionally jumping", but the more you do it the farther and farther you get from even finding the footprints of the bull.

Well actually, in the end nobody is telling themselves they are "dimensionally jumping" - that's the point. That's why it is described the way it is. Someone may start out that way, of course, but the framing of the subreddit is intending to push back against all descriptions. With that in mind, I would say that Zen puts formulations into context rather than obliterates them, although that is poetic. I like the ten bulls, but I also feel it can needlessly obfuscate something that is quite simple and mundane in the seeing, albeit not possible to formulate in language and concepts (what with being what those are "made from", basically). I unintentionally misquoted you a little on "the land", apologies, but my sense in it was to refer to something like "the full topology". You secure yourself to that larger content (the land), or you secure yourself to ("the background nature of experience of which the content is also a one", Zen). You are not separate from either, of course, but you are the latter. So the latter is what you should be aiming for, although I'd say there is not really a path to it - there is a path in thought you can take in your thinking about it, but that is something different, in parallel, and something you give up eventually. Why not give it up initially!

The sense in which these exercises are "dangerous" only this time you (meaning, the experimenter) will get what you knowingly chose, unlike all those times you accidentally did it. And hopefully this leads you to have a think and notice: there is only one cause - first cause - and all else is, as you say, "head games". The couple of demo exercises given are deliberately chosen for that. I don't agree that desire is inherently problematic. In the larger context, in fact, it just doesn't matter.

Formulations are not obliterated a such - they are recognised for what they are, in their place with any other strands of thought, within the context of that. Part of the story of Zen, surely, is the story of seeing what "descriptions" are. But again, that's somewhat problematic to talk about - and it's only directly clear when we "cease" describing. That's what ends up happening eventually (although "happening" is not the appropriate word). So - on the rest, although interesting, we probably disagree more than I anticipated. To me, it does not make sense within a Zen perspective, although it might do within a shamanistic one. The latter is, however, optional. Even the notion of "techniques" in the sense you are describing them is problematic; they are highly context dependent (fortunately).

...So, the word "story" was obviously used in the poetic sense - I was not saying that Zen was a fictional narrative. I do really hope you're not going around offering this sort of teaching of a "fire and brimstone" perspective of Zen, because it's wide of the mark in my experience (literally) - and just doesn't make sense in the context of the insight of "the nature of experience". Of course, it can make sense if you pattern yourself with that sort of thing - but in this subreddit that's exactly what we don't do, since we acknowledge the structuring that takes place with the acceptance of descriptions and formulations. There's nothing necessarily special about "ancient techniques" - except that they are largely misrepresented because people no longer understand imagery and metaphor. I don't think they particularly mind being violated, because they... aren't anywhere. One must of course "format things responsibly", as it were, but that is within a person's own influence, with understanding.

How far are you from your real hands?

Closer than close, of course, but no closer than I am to everything else - nor further, naturally. I'd be very impressed if I'd manage to become separated from myself, because I don't see how it is possible. I may imagine-that I am something separate from other things, but that separation too would be... me. (This also makes your notion of "personal bubbles" somewhat problematic.)

Now, I would never dissuade someone from a "lentils & land" approach to life if that is what they want to follow, but talk of "reckonings" and the ancients and the totality of work - that is the story-fication of existence. It's certainly possible to have experiences aligned with those sorts of views if you embrace them; it's also fascinating how quickly it all falls away into the void when you stop, along with all the fear that goes with them.

...Maybe better to say: *everything you intend and/or imply has an effect?*

Has an effect upon what, though, that's what is important. Can you influence another person's personal bubble? Does it even make sense to talk of that, when they are not separate from the world, and you yourself are not separate, or located, or individual as such? And so on. None of which particularly matters at the root, of course. Shame. Lentils & land sounds quite fun, now and again.

...But what is the source of the effect, the "cause"? As you read my message in your personal bubble, in what sense am I affecting you? In fact, what is the "you" that is being affected? And can I affect you contrary to the structuring of your experience? (Otherwise I cannot be said to affect you, surely; it's just another experience associated with your current condition and nothing is being changed.)

...I'm engaging in discussion with you, my questions being largely rhetorical, curious as to how you would respond in your language - because your comments don't line up with how I would phrase these things, but that is fine. I'm not actually seeking answers from you. Still, you've got the two-part, comma-separated sentence thing down pat anyway. ;-)

...I really wish you had put a comma in that first sentence...

Isn't "technique" the wrong word to use here, though? Since that suggests something that is done, as an action, with results, by an actor, within the world. "Decided" may also not be a good word. It is a pre-existing interaction, certainly, and we might say that the current state implied it, made it inevitable or deterministic. It is probably best to put that down to difficulties inherent in a verb-and-noun language when we are talking about something which doesn't "happen" as such.

I employ the word "technique" in its common usage, because that is how it will be interpreted by most people. With a more specialised audience, this matters less, but those unfamiliar tend to interpret a technique as involving doing something. When in fact, the act itself is largely irrelevant, more of a collateral result - if even that. (The subreddit deliberately tries to avoid using the word "technique" or "method", using "exercise" as a less loaded term.)

In my experience, phrasings like "a technique used without technique" are fine once someone already knows what is being referred to, but is worse than confusing for those who do not - hence best avoided, probably always (in my view, of course). "Understanding" Zen misses the point, surely? ;-)

Well, alas the deterministic path implied by "my" "past" intentions (which of course all occurred in The Now) has finally (has always) led to my retirement for this evening, and so, having refrained from intending further, we'll have to leave it there for now (since when else is there?). Thanks for engaging; keep collecting wisdom.

...Sigh. That's the eternal for you. > > >

POST: Missing Point ____Something that does NOT make sense

To ponder: You are making a lot of assumptions in your description, the primary one being that "you" are somehow "inside" a brain. Have you ever actually experienced your brain? Your account starts a few levels too "late" in terms of its concepts, perhaps. You have to start "before" your inferences about the nature of experiencing. In particular, we should be careful about our assumption that "the world" is inherently formatted in the same way as our moment by moment experiences are. In other words, our assumption that the world is a "spatially-extended place unfolding in time" and that we are somehow "in" that world should not be taken for granted. (Be sure to read the metaphors in the sidebar if you haven't already, for a sense of how this might be flipped around.)

yes this is why I said "from a scientific prospect".

It doesn't really fit into that narrative framework. For starters, the fiction of the "objective world" container concept and the idea that "the world is made from parts" are both incompatible with it - it is "too late" as I said. Now, you could pursue this through a variant of QBism, perhaps - see here <https://www.nature.com/articles/507421a> and here <https://www.quantamagazine.org/quantum-bayesianism-explained-by-its-founder-20150604/> - but frankly it's a waste of time in terms of seeking a "scientific" explanation as generally understood. This is because it resolves to something akin to being an experiencer with a "private copy" of the world, navigating through the possibilities as if you were traversing a pre-existing memory block. This is philosophy and metaphysics. Now, that isn't to say we can't conduct structured investigations into this area - in fact, that's exactly what is encouraged here. We are talking about an applied philosophy; our metaphors are active metaphors. However, you really have to take a step back from "brains" and so on when doing this. Even a moment's pause for contemplating the implications of the standard view - by which I mean, that all that we know arises in our "mind", even if you choose to equate that with your "brain" - indicates that this makes sense. Other than a handy metaphor for "my experience has structured patterning", the concept of neuro-connections isn't going to be helpful here, in what amounts to a direct exploration of the nature of subjective experience.

POST: So we can change "What" but now "How?"

It might be worth considering that there is no "how", only a sequence of "whats". By specifying one particular "what" - which is to say, asserting a particular moment as "fact" - you logically imply other "whats" in doing so, since the world is a coherent, self-consistent pattern which must always "make sense" between shifts. The more "whats" you specify, and to a greater level of detail and intensity of contribution, the more fully defined your ongoing experience will become. So the true "how" is never within the experience - experiences do not cause other experiences. The only cause is "intention-imagination-assertion-intensification", or whatever you prefer to call it. And the way you control the apparent sequence of events consciously, if you want to do that, is to intentionally define more and more of the extended pattern of your target outcome.

Also, is trying multiple dimensional jumping methods at one interruptive?

I'd stick to a single approach for a particular thing. Trying multiple approaches at the same time is basically a declaration of doubt that any of them have taken hold, and it's possible that the implied patterns of different approaches are contradictory, even if the intended outcome is identical. On the other thing I'd say, if you've done something which amounts to a "have life unfold as if this-thing didn't happen or isn't relevant anymore", you might benefit from repeatedly asserting that pattern over a period of time. After all, if you have already observed something to be "true" then it tends to have quite a high contribution to your ongoing experience afterwards. What you are aiming to do is have an alternative version be "brighter" than the original version. The more you assert your target pattern, the more any logically inconsistent alternatives will diminish in their level of "factness". (This is why asserting a future situation, or a more abstract background fact for which there has been no counter-observations, is easier - there is no direct competition to the truth you are asserting.)

Maybe also check out The Pruning Shears of Revision, linked at the end of the Neville Goddard post, for one example of approaching this without much in the way of conceptual baggage. One of the other links, Imagination Creates Reality, gives you the worldview he is using. (Of course, everything resolves to the same underlying thing; these are all different ways of saying it, different ways of applying it.)

POST: This was a massive jump. But it wasn't intentional. At all...

Q1 (falken96): Nice try, see how they like it in /r/NoSleep. Which is basically where this entire subreddit belongs, lmao

The point of this subreddit is to explore the nature of experience and perception, how it is influenced by intentionally using explicit or implicit reformatting metaphors, and seeing how far it can go. It's not about literally jumping into parallel universes (as you'd know if you read the sidebar or introduction). However, that doesn't mean it doesn't bring about results which can seem that way. As the sidebar says, though, the idea here is that nobody takes anything for granted - that includes both the concepts being explored and our everyday assumptions about the world and how we experience it - and instead tries things out for themselves. Nobody should simply assume there is something to this without testing it, just because they'd like there to be. (The same applies the other way around too, of course. Just because you can't think of an explanation of how it could bring about a result, doesn't of itself mean it doesn't or can't.) People here are reporting the results of experiments, or pondering the implications; they are not subscribing to a world view as such. Finally, there's not much point in showing up to subreddits you don't know anything about, and being a dick. Fine to challenge ideas or ask for an explanation, but the sort of wild-eyed defensive manic tone in your comments below are a waste of everyone's time - mostly yours, though.

EDIT: Oh the irony! [https://old.reddit.com/r/Glitch_in_the_Matrix/comments/4cijfm/sudden_realization_about_the_universes_nature/d1j8y8l/]

POST: Implicit reformatting metaphors & Magick / Occult

If you want to play around with a "magickal" perspective, while avoiding the historical and cultural baggage of the older traditions (everything is "of its time" so you shouldn't get too bogged down in the contemporary "wash" of things, I say), you might check out Phil Hine's Condensed Chaos, Alan Chapman's The Camel Rides Again, and Ramsay Duke's SSOTBME: An Essay on Magic. As regards the difference between "magick" and "dimensional jumping", here's an answer I gave recently: I suppose you could say that they are both different "traditions" based around the recognition that there is no difference between moving the fact of where you arm is, and changing any other world-fact. In other words, that: "experience is apparently local, but intention is actively global".

This underlying truth is true anyway; things like "dimensional jumping" and "magick" are just ways of thinking-about the world that incorporate that truth and so make the unthinkable (by which I mean: literally unthinkable, because it's not possible to think about the nature of experience) nearly thinkable, at least in terms of conceiving of outcomes while using a narrative structure. A key element of "dimensional jumping" is that it explicitly recognises this meta aspect, at a formatting level. In other words, it acknowledges that the only fundamental truth is "the nature of experiencing" itself; everything else is relative truth only. You may have experiences "as if" something is true but it is never irrevocably true. That includes the existence of everyday objects as much as, say, "auras" or whatever. All of this means that you are free to explore and incorporate the elements of any tradition you find attractive, and leverage any metaphorical concept to get results - while realising that there is no deep and permanent mechanism of "how the world works" underlying it all. (In fact, there is no mechanism at all other than awareness and intention.)

POST: Seeing repeating number patterns after two glasses

This is actually the basis of the whole thing: "the patterning of experience". In this example, it's like you've overlaid a pattern onto your world and it's "shining through the gaps" wherever the opportunity arises. When you become more opened out and relaxed - perhaps because you've selected that as an outcome, or as a side-effect of something like Two Glasses which leads you to do this - you tend to see more of that sort of thing, and the more you notice the more prominent it'll become, as the "relative intensity" of the pattern deepens. Things like geometric shapes and arrangements sometimes become more obvious too. It's a bit like the "raw component" level of experience - outlines, colours, layouts, symbols - becomes more visible, becomes a bit more independent of the usual "world imagery" of objects and such.

Just be sure to not get too obsessed with it - people waste years thinking this is a "thing" and trying to wrestle with it, which of course just implies the pattern again and further intensifies it. It is a "thing" of course; it's just not that thing. If you keep in mind two views of experience at once - that it is simultaneously a "world full of objects" and an "imagination space upon which patterns can be drawn" - then you can come up with ways to use one view as a way to affect the other. For example, if you wanted to "summon" a person, how would you do that, such that their "pattern" would "shine through" the next available plausible gap? And so on.

In our case, the training program would be our minds (or spirits)?

So, probably the sooner we get a grasp on what our direct experience is actually like, rather than what we tend to think-about it, the better. Our thoughts-about experience are always actually "parallel constructions in thought", happening alongside the main strand of experience. We never really think about the world, we think about a world, in a separate strand. If we never look to check what our actual ongoing moment is like, then our "constructions" will lead us astray, and making the connection between "patterning" and "the world" intellectually will be difficult. Later, this helps makes more sense of events like your examples there, and also what it might mean in terms of influencing the content of experience. As a preview though: basically, you should treat the "imagination room" metaphor as almost literally true.

First, I'd kick off with: the "feeling out" exercise described in this comment. So, what you will note is that the experience you are actually having has no edges, that what you think of as "you" is actually just a set of floating sensations plus a thought of "you", and that actually "you" seem to be unlocated in the scene: you are "over here" and "over there" and everywhere. What you seem to be is an "open awareness" in which sensations, perceptions and thoughts arise. Even your thoughts about an outside world actually appear inside that "openness". We might then start to ponder what effect holding a thought in mind has. Is it perhaps the case that thinking an intense thought in the same space where sensory experience arise, a bit like drawing on a 3D-immersive multi-sensory screen?

...

Someone pointed out to me that 982 also has a meaning in the Marvel Comics universe which is relevant to "parallel realities" (they assumed that's where I got the idea of using that number). From the wiki summary:

MC2 (Marvel Comics 2) is an imprint from Marvel Comics whose comic books depict an alternative future timeline for the Marvel Universe. The imprint was spun off from the events of What If? #105 (February 1998), which was the first appearance of the character Spider-Girl, Spider-Man's daughter from an alternative future. This reality was designated as **Earth-982**.

POST: I did the two glasses thing

Relax! Perhaps you need to change how you are thinking of this generally. Instead of thinking that you are jumping between universes, like some sort of inter-dimensional soul, instead think of it as having a "private copy" of the world, a copy which you can modify. This means that if you intend a change (and note that change happens instantly, even though the signs of it may appear only later) you can always intend a compensating change later - because you haven't left anywhere, you've changed somewhere. It's called "jumping" because the changes can be such that the facts of the world shift in your ongoing experience, meaning it seems "as if" you have gone to another universe. Meanwhile, don't go reading fictional scare stories and taking them seriously. In effect, the underlying concept of "dimensional jumping" is extremely simply and you have been accidentally using it all your life. That is,

- "Sensory experience is apparently local, but intention is always actively global."

Until now, you've only been using deliberate intention for, basically, summoning body movements as you roam around the world. Actually, though, any intention shifts the entire world-pattern to some degree, is overlaid upon it, so intending a change in a "world fact" and intending a change in your arm position are identical in kind. The Two Glasses exercise is a structured way of "re-patterning" your experience by attaching to a current and target state and transforming their relative intensities or contributions to

the world. There's no reason to fear - you're not going to encounter a bad outcome unless you deliberately (and I mean deliberately, I don't just mean a passing thought or whatever) intend for one.

I saw Kynari say in some thread that we are shifting all of the time, naturally. What exactly does that mean?

Personally, I don't think that's a very helpful statement, although I get why they might say it. Let me lay out a line of reasoning that you could use to interpret it. Let's imagine that you have a "private copy" of the world. Right now, that world can be described as a particular pattern of facts - the world is in a particular "state". This state fully determines the moments of experience that are going to appear in your awareness, from now into the future. This includes the things you are going to see happening around you and your bodily movements, and so on. If right now you simply "cease interfering", your ongoing experience will continue spontaneously, in accordance with that state.

Let's say that this "state" = "a dimension".

Meanwhile, we will call deliberately interfering with that spontaneous flow of moments "intention". If you "intend" something, then you are shifting your state to incorporate the "intention" into it. Once you have "intended", the state now includes that new pattern ("the intention") and you will now experience a new deterministic path defined by that new state.

Aside: To get an everyday feel for this, "intend" right now to go and get a drink of water - and don't interfere with what happens. You'll find that your body will move "by itself" to get and get the water. Your new state now includes the intention and the experience happens accordingly. Note that if you are someone who has developed the habit of constantly "asserting their bodily position", you might feel that nothing happens. If this is the case, first intend to "cease interfering", and then intend the task.

So, from this we might say that every time we deliberately intend something then we are "shifting dimensions". This includes intending that we do in resistance to the experiences that appear. However, we typically do not intend constantly, and so we are not "shifting all of the time". A shift is not the same as a bodily movement or a passing thought; those are spontaneous pre-determined arisings from the current state. Ideally, then, we should live our lives as a spontaneous, effortless, resistant-less unfolding - with only occasional redirections (shifts) via deliberate intention. This is where all the talk about "detachment" and "allowing" and "trust and faith" and "absolute surrender" comes from: only by letting go of trying to control each moment, do we gain control of our overall experience. (But even if we don't let go, we are still not "shifting all the time", because the resistance itself will lead to a fixed state - just an unpleasant one.)

TL;DR: We are not "shifting all the time"; we change state only when we deliberately intend change; mostly people do not do that except in the case of occasional resistance to experience; many people probably don't actually intend at all.

POST: It doesn't need to be with glasses

Definitely. Something to note, though: there is a difference between writing out a description, say, and actually linking objects (mental or physical) to particular situations or patterns. So no matter what the format, be sure to actually ponder your current and target states, and let the words come from that contemplation, rather than just writing out something or working out the words to use intellectually. That way, the words will be "handles" onto those specific states, rather than simply unattached words that will trigger a more general extended pattern.

(Although the Two Glasses instructions don't specify this explicitly, they are structured in such a way as to lead you to do this - provided you actually follow them and aren't tempted to interfere and analyse things during the performance of the exercise.)

Lo! it's fun watching you guys discover sigils.

It's even more fun watching people who are committed to sigils discover that it's all just assigned meaning and patterning within your own imagined perspective! ;-)

There's a benefit in having different angles on the same underlying approach. Sometimes things like "sigils" (and "servitors" and all that) have quite a bit of baggage associated with them, because they're still linked to a particular worldview or to a tradition with some contemporary decoration that no longer makes sense. "Sigils" make a nice halfway house pattern between older ritual approaches and a more direct non-dual approach, but it would be a shame if anyone stopped and felt satisfied at that point, rather than pushing it that towards a more generalised pattern that connected to an understanding of "the nature of experience" more fully.

Also... We know it's assigned meaning? That's kindof literally how it works...?

So - how, exactly, does that work, literally? How does one assign meaning to something, and why should assigning meaning accomplish anything?

Without a descriptive framework for that, we're left sort of hand-waving the topic, rather than being able to deliberately construct outcomes via actions.

Correct. However, one day you guys will realize that you're literally doing the chaos magic thing (which you, btw, just summed up very nicely) except in a more dogmatic way (though I think this post kinda points out that the dogma that permeates this sub is pointless... Yay milestones.)

No, it's a bit different to chaos magick, which I view as a bit of a failed experiment. Chaos magick had an idea - basically, the adoption of belief as a method for structuring experience - but because it never really worked out what a "belief" was, nor had a "meta-metaphor" for managing and directing it, it never really went anywhere. It's basically dead now. The underlying concept here isn't really that you are "jumping dimensions" of course; that's just a formatting metaphor. The real point is to be able to directly observe and utilise a formatless platform, and then knowingly engage in "the patterning of experience" (for example) via intention and implication. The more important thing, though, is to ask how or why that can work, right?

Q1: Yup accepting a new truth/reality/dimension through use of "assigned meaning techniques" or whatever is different from causing a paradigm shift through a "magic ritual". /s You clearly have some kind of baggage/hang up about the occult. I'm sorry, but the main thing with chaos magic is the idea that you can do magic without a set dogma (basically, whatever works for you is good. Or "nothing is true, everything is permitted".) if you think this "dimensional jumping" is anything but another way to preform practical magic, you're misinformed. All magic is based on self hypnosis and assigned/reassigned meaning. But whatever, that's none of my business... Clearly the "two cups" method is different from "magical elixir/charged water" and suggesting that you don't need the cups, but just focus attention and a symbol/goal is clearly not at all "sigils"...

Sigh. Save me the sarcasm, eh? It gets us nowhere. Definitely, "dimensional jumping" in the broader sense is as different to ritual magick as ritual magick is to having your arm move. That is to say, there is no difference in their nature at all. There's not much point in arguing in that area: before we know it, we'll end up retorting "oh, but that's just a movement of consciousness" to everything. For sure, chaos magick had the idea that "whatever works for you is good" - and that's a nice principle to bear in mind - but then got stuck because that's not really an idea at all. It has no content. It never went anywhere as an approach, because there's no substance to that statement. I don't really have a hangup about "the occult" - hey, it was fun times - other than that the categorising of some things as "occult" and "magick" tends to makes them seem distinct from mundane ongoing experience, something special that requires "techniques". For example, if every assigned meaning is effectively a reshaping of experience, then labelling some as "sigils" and not others, without digging any deeper, isn't helpful or insightful. It stops the exploration dead for many people.

All magic is based on self hypnosis and assigned/reassigned meaning.

First, we should probably broaden it out and say that: "all experiential content is based on assigned or implied meaning."

But then: how, though? How does that work? What does "self hypnosis" even mean? What and where is this "self"? It's not even clear that such a thing actually exists, other than as a container concept. Without a metaphysics - a base formatting - that doesn't really help us at all. It doesn't have any meaning, assigned or otherwise.

Q2: I agree with the need for some sort of metaphysics or belief system. If you think you're free/above such things then you are deluding yourself. A teacher of mine once told the story of a friend who built a device to erase all of his beliefs. After using it, he died a few days later of multiple exotic diseases. Perhaps he no container left to protect him? If you subscribe to the Judeo-Christian metaphysics, then you have angels and demons; you are under their authority. If you subscribe to some other metaphysics at the deepest psychic level, then those are your rules for morality and magic. I'm still examining my own through introspective meditation.

Agreed. People sometimes get into these things thinking that if they could just delete their limitations, everything would be great. What would happen instead is, they'd destabilise the structure they had in place, getting some unlovely side-effects, or end up with something more like a strand of associative thought rather than "a world". It's good to be aware of your current structure, but I tend to feel the focus needs to be on shifting to a metaphysics or "formatting" that is cleaner (maybe somewhat "diagrammatic" rather than symbolic), rather than just dismantling something. The term "beliefs" can be part of the problem, I find. It's not always clear with that whether someone is referring to the formatting of their main ongoing experience ("the world"), or a strand of thought about their experience. The boundary is not a simple one, but focusing on the latter while thinking one is addressing the former can lead to issues. Descriptions can never really capture this, of course; as you suggest, our "own ... introspective meditation" is how we make progress with this stuff.

POST: Help me with two glasses

That's some OCD happening right there! :-) Don't worry, you can't do this wrong. Just follow the instructions, as they are written, and don't fret about it beyond that. Maybe this comment might be useful:

Something to note: there is a difference between writing out a description, say, and actually linking objects (mental or physical) to particular situations or patterns. So no matter what the format, be sure to actually ponder your current and target states, and let the words come from that contemplation, rather than just writing out something or working out the words to use intellectually. That way, the words will be "handles" onto those specific states, rather than simply unattached words that will trigger a more general extended pattern.

Apart from that, as someone else mentioned, you are meant to do this once, then put the glasses away and carry on with your life. The change happens when you do the exercise - it becomes true now that things will happen then. Checking and tinkering afterwards tends to imply the initial pattern again, essentially re-intending the starting point, a bit like being in a standing position and confirming just how "standing" you are by sitting down again.

POST: Questions on dimensions

It's not really like that. Read the sidebar and links about how there is no "other you" and you don't go anywhere as such. Nothing's left behind in the sense of your old situation still "happening" without you; all that's "happening" is your current situation. So to "go back to your original dimension" really just means to make another change to your experience such that it's "as if" things were as they used to be. When you stand up, does "standing-up you" leave a "sitting-down you" behind? Can you ever return to your "original posture" after you have stood up?

What I feel when dimension jumping is that you have to be absolutely sure you want to leave everything you've ever known and have for something "more". It's a sacrifice that you have to be willing to take; so yes. Possible loved ones are left behind. I haven't tried going back to my original dimension (if I even jumped in the first place, I have some doubts here and there but I feel like I had possibly jumped) because I'm /now/ happy where I am.

Although the idea of literally leaving things "behind" doesn't really apply, it's certainly the case that to allow a shift in your ongoing experience you need to, to a greater or lesser extent, be "okay with whatever happens". You do have to sacrifice your current world (where "world" means "your current state") in order to shift to a new world (state), because "the world" is one continuous coherent pattern that must always be internally self-consistent. That world-pattern, of course, includes both the pattern of you-as-person and also the patterns of "loved ones" (all of which can be described as the "shape" taken on by you-as-awareness). Therefore, all shifts imply a shifting of the whole and, in a way, a willing sacrifice of everything you currently know.

POST: Two Glasses Exercise With More Than One Word?

To be honest, you don't really need anything to be explained; you just need to follow the instructions as written. Over-thinking it or trying to do it "right" will tend to get in the way, because the exercise is deliberately structured the way it is. Save the thinking for later when you actually have something as an outcome that you can deconstruct. However, I'll say: the reason you are asked to use single words is because you are not actually "describing the area of" your situations. Who would you be describing it to anyway? To "the universe"? This exercise is not a "send a request to the universe" type exercise. It's about creating "handles" onto fact-patterns and changing their relative prominence by leveraging a pre-existing operational pattern. You might find some additional detail from a previous comment useful:

Something to note: there is a difference between writing out a description, say, and actually linking objects (mental or physical) to particular situations or patterns. So no matter what the format, be sure to actually ponder your current and target states, and let the words come from that contemplation, rather than just writing out something or working out the words to use intellectually. That way, the words will be "handles" onto those specific states, rather than simply unattached words that will trigger a more general extended pattern. Apart from that, as someone else mentioned, you are meant to do this once, then put the glasses away and carry on with your life. The change happens when you do the exercise - it becomes true now that things will happen then. Checking and tinkering afterwards tends to imply the initial pattern again, essentially re-intending the starting point, a bit like being in a standing position and confirming just how "standing" you are by sitting down again.

So: one word for each label is adequate! You can use two words or in fact any other symbol if you feel it appropriate, and so long as you're not trying to create a description of the situations you'll be fine, however there's no need really.

Is there a limit to how frequently this can be done?

No, but it makes sense in terms of "experimentation" for you to leave a decent gap between each session, especially given the last instruction. Typically, I'd say leave things for about a week before considering doing another two glasses exercise.

POST: Sitting outside for hours

So, you might consider whether you are trying to "force" this to happen, rather than following the last instruction (to "carry on with your life)"). The circumstances in which outcomes arise tend to "happen to you" rather than you seeking them out. That does include feeling or finding yourself "moved" to do things, certainly. However, this is spontaneous; you don't need to check for the feeling; it's sometimes only apparent in hindsight. Only you can judge whether the action you are taking now is a sort of over-vigilant "pushing" or if it feels like a natural opportunity you were drawn to.

Don't feel foolish - just think of it as having stretched your legs and got some fresh air! ;-)

So, generally, the experiment with the two glasses means you do the exercise, then carry on with your life without tinkering, typically leaving things for a week or so to see what comes up. The results come to you. Circumstances arise, feelings shift; you don't try to "make it happen". (And in fact keeping doing so can tend to re-trigger your old state, since the effort comes from that position.)

Of course, this isn't easy when we are dealing with something we really want to happen, but it's how the exercise is meant to be approached. This is because actions with attempt to force an outcome tend to be ones you've "worked out" in your mind in your own parallel thoughts, rather than actions that have arisen as part of the larger movement of your intention. Note also: the idea is that the results have been put in place at the time you did the exercise. That is when the shift of state occurred, and from that point on you are just seeing the already-fixed results play out in your experience. In other words, it becomes "true now that this happens then". Anyway, if you can, try to take this all in the spirit of "performing an experiment" or "investigating" how the two glasses exercise works. That way, you take a step back and are wondering "how and whether this interesting experiment operates" rather than "when oh when will I get my outcome". The latter is a "patterning" of yourself with the fact of "I am in a state where my outcome is in doubt" and is also the reason you shouldn't spend too much time in deliberate thought about your situation or your concerns about it (passing thoughts are of course fine).

So, I did this twice in the last two days. The first time I did it was after a long night out, and I admit, I was high from earlier. Today, I became rather anxious about being high and convinced myself that that somehow nullified the results because I wasn't in a clear state of mind. So, I did it again today—right before my initial post. Does me doing it twice in two days make the desired outcome less likely?

It doesn't really work like that. You should treat every time you do the exercise for a particular things as a "reset and replay". Just as, for example, if you are in a chair and you stand up, sitting back down and repeating the process doesn't make you more or less "standing-up" than you were before. So: set aside a little quiet time, do the exercise, and then follow the last instruction - forget about it. (See this recent comment too [POST: Two Glasses Exercise With More Than One Word?], perhaps, just to emphasise things. Note that there is no effort involved in this. You literally just follow the instructions as written. Don't try and work it out, or concentrate, or put energy into it, or whatever. None of that is needed.)

Ah, alright. That makes me feel a lot better. I was just nervous because I saw a previous post saying that doing it repeatedly for the same thing could put you further, or back to, the original state. Thank you for your response and engaging with me!

Yeah, don't worry about it. While you shouldn't keep repeating it - once and done! - it's not as if it causes harm, it's just that doing it doesn't add anything, and essentially restarts the process again. So in the spirit of conducting an experiment, do it and leave it be, then just see what turns up over the week or so that follows. Good luck!

POST: Tried a big jump into a fictional universe while changing my body and....

As another user said, let things normalise. Just stop tinkering for a bit. Every day do a "daily releasing" exercise for 10 minutes: rather than doing a focused meditation, just lie down on the floor in the constructive rest position and "give up". That is, let your body, thoughts and attentional spatial focus move wherever they want, and "be okay with whatever happens". Don't attempt to control the experience at all. This will let everything settle out (it's something you should consider doing every day as a routine regardless). For the rest (and this is something you might find the above provides insights for), experiment with being sure that when you concentrate or focus, that you do not narrow your attention spatially - in other words, stay "open" and "unbounded" while doing your intending. Intentions should not be accompanied with a sensation of effort; a sensation of effort is an additional experience that does not contribute, just as tensing your muscles does not help you push or pull an object, it merely creates an obstruction by fixing a position.

Can you actually jump into a fictional universe oh my god

Well, I suppose you could say that this is a fictional universe, really; it's just that you've got kinda used to it over time.

Sorry to reply to another comment, but exactly this!! Correct me if I'm wrong but it's like... Since the day I was born I have been reading the same book. My mind has been focused on the same book for 22 years. Now I'm starting to move around the library and pick other books to read. It's just opening the book that's the issue haha.

Right, wandering though The Library of Babel, perhaps, with Jorge Luis Borges. You lift up your eyes from the page, find yourself surrounded by hexagonal shelves - which book to choose?

POST: Modified Owls of Eternity - I'm Seeing Doppelgangers

[POST]

I was feeling experimental and decided to play with the limits of the Owls of Eternity experiment. Instead of owls, I chose to call more sharks into my life. I recalled images of specific experiences throughout my day (my office desk, the subway car, my living room, my street) and superimposed an image of a shark on top of these mental images, and held onto this new image for as long as I could before moving on to a new recalled image. For the next two days sharks showed up everywhere: On multiple stranger's t-shirts
Someone referred to their gf's period as shark week
my coworker told a story about their crazy uncle's gun collection and how he would even carry heat on his boat "because a shark could come out of nowhere" (so crazy)
And I even saw a shark tattoo on a random porno (it was hilarious). edit to add: this one was the most impressive. I suddenly got this urge to see this one, very specific video. I've seen it a couple times before, its super obscure, and it was calling me. I soon realized why it was calling me when I noticed his shark tattoo. Amazing stuff really.
Reflecting on how well my Sharks of Eternity worked out, I decided to alter the experiment again, and make it much more specific. I decided to replace the sharks/owls with my crush. I did the same thing as before but with his name and face superimposed on my images.
Long story short: I'm seeing doppelgangers everywhere. Its amazing. And its more than just strangers on the street. Today I noticed a new guy in my office that looks uncomfortably similar to my crush. Additionally, his first name is showing up a lot too.
I'm blown away. Just dumbfounded. Amazing stuff.

[END OF POST]

Yep, that's the right idea. You might also experiment with not just intensifying a visual image, but also adding some context - by including a "knowing" or assigned meaning with it. That is, for example, incorporating the feeling of "me imagining this means-that <insert fact here> is true". You could consider an "image" in the more general sense: that you are intensifying (the subsequent contribution to your ongoing experience of) a multi-sensory meaningful pattern rather than just a visual.

Is this a possible mechanism to tackle limiting beliefs...

I definitely say it's a possible approach to tackling limited beliefs - or more specifically, limiting "formatting" in experience. You don't have to restrict yourself to tinkering with "world facts"; you can experiment with addressing "meta-facts" also. Aside - I'm not sure I find "beliefs" that great a concept; it's quite vague. A belief, as in something that appears as a thought about whether something is possible or not, isn't necessarily a problem. You can just ignore the thought and intend the outcome regardless, then resist tinkering due to doubt. What's important is the "patterning" of one's experience, which may or may not correspond to any passing thoughts you have, or indeed any "conceptual castles" you have about the world. I think this is an area once needs to examine personally, to note how it really is for you; trying to change "beliefs" can become an unfocused and sort of superstitious activity if you're not careful.

You're saying to use other senses that I have at my expense correct?

Not just senses and emotions - which for sure will further narrow and specify the pattern - but also "knowing" or "meaning". That's why I phrased it as "multi-sensory meaningful pattern". This is an overlap with the means-that concept, really, but there is a difference between "imagining an owl" and "imagining an owl + knowing that this means physical owls". (You could also take this into pure symbolism, where you have decided-that an owl is the essence of certain properties, and that imagining it means-that those properties will increase in certain ways.)

So, in summary, I suppose, we're talking about the assignment of meaning via intention, explicitly or implicitly.

...

Or it could be that you are more conscious of sharks, so you will notice more of them. I find this when I get a new car or there's a particular car I want. Probably not jumping dimensions here.

It could be that you "notice more of them" - that is, the sharks are already there in the environment and you are just finding your attention is drawn to them (confirmation bias). The way to check that, would be to perform the experiment multiple times with different things, increasingly unlikely things and scenarios and patterns, and see what happens. In particular, you'd choose things which are not naturally in your environment, so that it isn't just selection of experience from 3D space - although we couldn't discount it being selection of experience from an infinite "space". For example, a focus on events and outcomes might be one way to approach this. (Meanwhile - you may be misunderstanding what is meant by "dimensional jumping" here.)

But why would that difference matter? We can say that everything is out there already anyway, and simply focusing on some things more (and thus making them 'appear' more often in a confirmation bias way) is succesful enough. What does it matter where does this stuff come FROM, as long as it is more prevalent in our lives?

Because focusing on this "formatting" - the "how things work", if you will - has advantages itself in terms of patterning your experience in a "confirmation bias way". It's the step beyond just picturing stuff or feeling "frequencies" to make them slightly more prevalent, to actually addressing the "as if" mechanics of your ongoing experience. Additionally, there is something more to pursue here than just "getting stuff I want via unlikely coincidences". That is, to conduct experiments and come to a deeper direct understanding of "the nature of experiencing" itself. Casting a critical eye over all facts/patterns to optimise them, recognising that there is no fundamental "how things work" at all, is quite a good way into that. The short version is that: the difference matters because the way you formulate an intention implies a certain set of possible apparent mechanisms for its appearance in sensory experience.

I agree, but what I mean is, what does it matter if it is a confirmation bias OR actually creating/recalling things to existence? As long as we subjectively experience their increase, that result is what matters.

(EDIT: Actually, I thought I was replying to another thread when I first responded a couple of messages back, but it's all worked out okay anyway.)

For sure, agreed: both "confirmation bias" (often a misused term anyway, in this context, since it presumes the thing under investigation) and "recalling from eternal background patterns" are really narratives or stories about experience. Parallel constructions in thought. If you get the result, it matters not a jot what you think about how it works (even the idea that there is a "how it works" is a parallel construction). Then, if you want to distinguish between the two (because you are trying to ascertain whether your default assumptions about experience are true or not), you repeat your experiments to the extent that it becomes undeniable that, for example, the results are less like "selecting experiences via attention from a 3D space" and more like "selecting experience via intention from an 'infinite gloop'". So, we're on the same page here. The extra bit, though, is that the formulation of our intentions can themselves imply a particular description, which then leads to experiences corresponding to that particular formatting. For example, if you have an assumption that the world is a "stable, simply-shared, spatially-extended place unfolding in time" with you as an object within it, and your intentions start from that sense of things, then you are not only intending your outcome, you are implicitly re-intending that standard view world-formatting. So it is not necessarily quite enough to just go "hey, who cares so long as I get the results", because without directly addressing your current patterning in your intending, you are reinforcing certain limitation. While saying "hey, anything is possible", we can be unwittingly intending that "really only these things are possible". This is why deliberately adopting the metaphor/patterning of the concept of "states" which define a set of facts and a sequence of moments, and intending with that "how things work" in mind, can be better than having an optimistic but non-specific notion of "we're jumping all the time and everything is possible, somehow". All of which is really just a way of saying: the only fundamental truth is the fact of the property of awareness or being-aware or being; everything else is relatively true only (conceived of in the most abstract way as a "shaping" of awareness, as "patterns" and "formatting" and "facts" or whatever). It's definitely worth being explicit about this, though - hence the idea of "active metaphors" and so on.

This sounds a lot like the Baader-Meinhof phenomenon.

The problem with the "Baader-Meinhof phenomenon" is that it's basically just a categorisation - that is, only a labelling of the experience that often when something is held in mind it seems that there is more of that something arising in your experience. Beyond that, the "brain likes patterns" and "it can trick itself into seeing a pattern" aren't really explanations; there's no mechanism suggested (how, exactly, does the "brain" do this? what is the evidence that it does do this, in fact?). It's a restatement. Although it is a catchy term. Really, then, it's just a rephrasing of the idea we are investigating: "experience tends to exhibit some sort of 'patterning' effect (and this can be used to advantage)".

While it may be that you actually jumped dimensions, or have attracted more sharks into your life through manipulating some law in quantum physics we have yet to discover

Well, "jumped dimensions" is a metaphor, remember; it's not intended to be taken literally in the sense of an external set of "places" that one is transported to. No actual explanation is offered, only a way of conceiving of it (one amongst many). No description is identical to "how it works". In fact, even the idea that there is a "how it works" is under scrutiny here. There is certainly no suggestion of "manipulating some law in quantum mechanics". This would be nonsensical anyway, I guess: a "law of quantum mechanics" is an aspect of a descriptive scheme, used to account for certain experiences/observations resulting from experimentation, not a thing "out there" that exists as an object that can be transformed. I could scribble on the relevant pages of my old copy of Eisberg & Resnick, I suppose!

Again, you're telling your brain to see/recognize something, which it is doing (I hope this paragraph made sense).

Now, we have the issue of how to distinguish between seeing something that would have been there anyway, versus now seeing something that wouldn't, and the difficulty of the whole idea of "would have been there anyway". This is why we have a similar issue with explaining things as "confirmation bias": that implies a stable background environment or dataset from which patterns are being selected. However, we can't necessarily take that for granted: this is actually one of the assumptions that is being investigated by conducting the experiment. As mentioned earlier, perhaps the selection of experience isn't actually from a 3D space? Perhaps the usual assumption that the "world" is a "stable, simply-shared, spatially-extended place unfolding in time", with you as an object within it, is flawed?

Aside - This latter area is something that is touched upon by some recent approaches to quantum physics, see here and here for accessible articles about that. This ties into the "objective frame" comment I'm about to make below. One of the authors also has a nice article on the reification of abstractions which is worth a look, here.

If you take into account all the times during the day you did not see anything shark-related, you would soon realise that there is an insignificant increase in the sharkyness of your life.

Relative to what, though? Comparing the number of "shark objects" seen compared to the number of "non-shark objects" doesn't tell you anything about the significance of the number of sharks encountered. The correct comparison would be between "number of sharks 'actually' in environment" vs "number of sharks 'experienced' in environment", before and after doing a patterning exercise. However, this option isn't available to use, for obvious reasons (the environment assumption, and the lack of repeatability, and lack impossibility of counting before the exercise). So we can make no comment on the significance from an "objective" frame, because the whole experiment is "before" the idea of an objective frame; it's one of the assumptions we are examining by doing the exercise...

One of the main purposes of which is to make you think about these things, but after doing the actual exercise. And repeatedly. Because the only way to really decide whether there is "something to this" (whatever that might be, we don't presume) is to do it many times, with many targets (first objects, then more abstract things, events perhaps) until it becomes undeniable that there is a link - or not, of course. The summary of this is, I guess, that it doesn't really matter what reasons we come up with for why this is "not a real thing happening 'out there'", or is "only this (insert named category of experience)" - the actual point is to more closely examine the nature of ongoing experience as it is, and not short-circuit that by confusing descriptions about "the world" (as parallel constructions in thought) with that world-as-it-is. Perhaps the "formatting" of the world as it is experienced is best described in another way?

There's a general rule when trying to prove a theory; You first need to try to prove it wrong. That is exactly what I'm doing.

One might say that this is what is being done here. It's not that anyone attempting to prove there is such a thing as "dimensional jumping" as such - as the sidebar says, "there is no theory of 'jumping' or its mechanism". That's not the theory that people are attempting, as an exercise, to prove wrong. Rather, they are attempting to prove wrong the theory that the world is a "stable, simply-shared, spatially-extended place unfolding in time". In fact, "that is exactly what we're doing".

POST: The Mandela effect and dimensional jumping

is the little ritual I did earlier constituted as a spell?

Not a spell. Ultimately, it's just what you might call deliberate, structured intention. If you are okay with moving your arms and legs, then you should be okay with this!

As for noticing spontaneous changes (versus one's memory of prior moments), I'd use them as a reminder that your ongoing experience of the world is more like a "pattern" in your (impersonal) mind or "awareness", than a "place" that is "out there". Remember that "dimensions" are a concept which we are using to conceptualise change; you never actually go anywhere, you just use it to create an "as if experience, using it as a sort of transformative pattern. And so, although we might say that a Mandela Effect

experience feels "as if" we jumped to another dimension, really we are using the term casually in that case, like a story. We could equally say that we shifted a fact in our "world-pattern" in our awareness as an implied side-effect of another intention, or that we accidentally selected a new subset of moments from an eternal memory block, or whatever. There is no unchanging separate "how things are" to refer to in that way, however. Except for just fun chat, I think it's best to consider such concepts and descriptions as "patterns we use as part of an intention, a context for defining an outcome", than any true description. The only true, unchanging, fundamental fact, then, is that of the existence of the property of being-aware (or "awareness"). Everything else is a relative truth, a temporarily active pattern of fact, only; the only causal force is intention and everything else is a result; and so on. So if you have the experience of a fact changing, then there is nothing more to it, nothing "behind" that, other than the fact changing. If you didn't deliberately intend a change to that fact, you may assume that it is a shift associated, with a byproduct or implication of, another intention. Even that is too much, but at least it keeps the "explanation" at the most basic level, that of "experience is patterned" and saying no more that is just "parallel fiction" (description in thought).

POST: How Can I Record Accurate Data Before/After The Owl Method?

I guess it all depends on what exactly you are trying to demonstrate for yourself. The issue here might be in your use of the word "accurate", if this is supposed to refer to some form of external world independent from you which is being measured, and which is affected by the exercise. That is, that there is a "real" before and after number of owls "out there" which the exercise is changing. But you never experience such an "out there" though; there is only the number of owls experienced. Even by simply deciding to keep track of owl instances, and being on the look out for them, you are already "patterning" yourself with "owls". You may indeed find that there are more instances of owl experiences after the exercise than before, because you are deliberately further intensifying the pattern. Ultimately you are not really demonstrating anything beyond that (that deliberate intention increases the relative contribution of the pattern being intended), because you cannot actually get outside of "experiencing" in order to have an independent reference point which is not entangled with your intention (or the implications of your intention).

Therefore, the pre-exercise data count should have little-no effect on the post-exercise data count, if given the 1-2 week grace period.

The performing the pre-exercise count will have some effect, and the exercise may increase that. However, even the fact that you are contemplating doing this experiment at all will have an effect. And you might well find that the pattern reaches extreme levels before you even get to the exercise, in anticipation of it, and the exercise itself doesn't really make any difference. You can't "fool yourself", basically, because your entire experience is "made from you", and continued attention corresponds to a continued deformation of your experience. This is what makes "proving it" experiments difficult to construct, and "objective world" concept experiments impossible (because it is a concept only).

To be honest, I'd throw away the idea of a conscious and subconscious mind, particularly in terms of them being "active" entities that "do" things. I've never seen a "conscious" or a "subconscious", personally.

if in the first part of the experiment I'm actively looking for it, it shouldn't show up as frequently or prominently if I understand the exercise correctly.

Why not? What you've actually done is pattern yourself with the intention "I will have the experience of looking for owls". That alone will increase the contribution of the extended pattern "owls", to some extent, even if you don't imply "...and finding them" on top.

But post-exercise, my subconscious mind should attract the owls, and more frequently.

Your subconscious doesn't "attract" anything. That metaphor implies that you are some sort of object in a place, and that your subconscious is like a magnet which "attracts" other objects you've decided upon. In the owls exercise itself, it makes the comparison with drawing a pattern on a screen and that pattern peaking through experience wherever an appropriate context gap opens up. That's a more appropriate metaphor, I think.

I need a control group to measure my noticing...

The problem is, that "noticing" is also a patterning! It is also a selection of an experience!

If I start the exercise with something that may have been frequent, but on the fringes of my perception...

If something isn't in your experience, then it isn't in your experience, though. The idea that there were things "on the fringes" that you just didn't notice, is basically a little story you'd be telling yourself.

then how will I know that I'm not just making myself notice what's already been there more often?

The point is that the idea of there being an "already there" is an assumption you possibly going to be challenging, so you can't actually use it as the basis for an experiment. As I said, you are possibly assuming that what you are is an "person object" in a "stable, fixed place with other objects in it", when the exercise is actually based on that potentially not being true. It might be more helpful to conceive of yourself as a sort of "open, void, aware space" within which multi-sensory experiences arise, as if selected from a background. That is, you are not a "body" which is "looking around a place", you are a "mind" which is selecting moments or "sensory frames" such as "the experience of being a body, looking around". See also, the Feeling Out exercise linked earlier. On version of it:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

To continue on your before-and-after experiment concept:

The pre-exercise is meant to keep track of what's already there.

There is no fixed "what's already there", so there's no good way to do that! The "already there" that you'd have to be referring to would be something like an "infinite gloop" of all patterns or an Infinite Grid of All Possible Moments that you are selecting your experiences from. So it is meaningless to measure a "before" and "after" for that, because both involve selecting experiences by intention (and the implications of intention), rather than noticing things in 3D-environment: The "looking for" is still a "selection" of an experience: the experience of apparently "looking for things in a 3D environment (and finding them or not") , just as the "intending and noticing" is a selection of an experience: the experience of apparently "seeing things in an 3D environment that you'd decided on". All you can do is pursue the exercise for different images, ideas or outcomes - different deliberate "selections" - until it gets to the level that the suggestion of there not being a causal connection between intention and outcome becomes ridiculous. See also, this recent response on the owls vs confirmation bias:

It's one hundred percent confirmation bias.

Although, we should ask: what exactly is "confirmation bias" in this case?

If the term is taken to mean "noticing patterns that were already there in a three-dimensional environment (a place)", then the extreme experiences one can have often seem to conflict with that. If, instead, we expand the term to mean something like "selecting patterns into sensory experience from a non-dimensional environment (an infinite gloop)", then we've got a description that's more useful, perhaps. In the first case, "confirmation" refers to confirming ones prejudices. In the second case, "confirmation" is more in the sense of confirmation of a property of experience. In neither example, of course, do we have access to an independent external reference against which to measure the "confirmation". However, in the case of "dimensional jumping" and that exercise, we explicitly recognise this fact - and pushing against ("confirming" or not) the standard "world experience" assumptions is actually the basis of the exercise. This sort of discussion we're having, though, is exactly what all this is about: digging deeper into our assumptions and being really picky about our world views and interpretations.

and in your own words

Hmm. As opposed to...?

where does it lead..

It leads to a clear perception of the actual situation, rather than just being lumbered with whatever you've ended up with in terms of your perspective, your default "formatting" of experience. Clear perception, then, of what is directly and fundamentally true of the content of experience (that is, the nature of all experiences), versus what is only conceptually and relatively true based on a superficial view of the content (that is, merely "being self-consistent" in thought, a conceptual "castle in the sky"). Without that, then everything else you think or do is (or might be) based on a set of misconceptions - i.e. it is wrong.

what is the use...

So, the main "use" is to no longer be wrong about everything! (Initially, of course, to realise that you might be wrong: hence the exercises rather than methods.)

Now, it so happens that the shift in perspective that this results in is beneficial - things like: the world is not a solid separate unyielding place, and you are no longer a little object waiting to expire, and everything is more flexible than you might have assumed. However, even if that were not the case (and, hey, no promises given: it's a "personal" investigation!), it would still surely make sense to thoroughly examine one's experience to truly ascertain one's situation, rather than simply assume that whatever ideas and habits you've ended up with are, without having really spent time critically examining it all, miraculously correct.

Very good indeed.

Oh, well done me, then! ;-)

Well, it seems like we're already talking from the same basis. I'm sure you'll agree, there's no way to truly articulate "your real nature", so we resort to metaphor (in my case: folds in blankets, sandcastles on beaches, patterns in space, and so on) and indirect pointing. It's non-conceptual, and language and thought is object-based. Or more to the point, the experience of thinking is "made from" and "within" the very thing we'd be attempting to think about. As a vague stab - where the purpose to more to have a formulation which indicates what things are not than what they are - we might have something like: "What you truly are is the non-material material whose only inherent property is being-aware, and which 'takes on the shape of' experiences on an 'as if' basis, including the experience of apparently being-a-person-in-a-world". Anyway, I'd say the answer is best conveyed by guidance towards an experience which might imply noticing, rather than by even a metaphor-based definition. For example, in the Feeling Out exercise referenced above, to try and find where you are within the current moment of experience, and to notice that although there is apparently an "over here" and an "over there", both of them are "you", and you are sort of everywhere and nowhere. The hope, there, is that this insulates against the tendency towards identifying with a particular experience as being "it" - including the experience of "realising it" - and thereby short-circuiting idea of a process of "discovery" more generally, perhaps.

Q1: Thanks for taking the time to write this out. My main question is, how do separate consciousnesses fit into this? Is this comment just appearing in my experience, or did its creatiom also fit perfectly into your experience? How is it possible for all of these aspects to fit together but also leave room for any possibility of my own consciousness shaping my experience?

There's aren't any separate consciousnesses, because we are talking about the thing before "separateness". So, when talking about this, I tend to use the term "awareness" because it isn't quite so misused, or is at least relatively little used and so easier to convey meaning with. Note: "awareness", rather than "an awareness" or "the awareness*" or "awarenesses". So we are referring to something which is "before" division and multiplicity and change. These are aspects of experiences, rather than the structure within which experiences arise. (In fact, it's not even a "something" because it is not an object; it is the subject to all experience, all apparent objects.)

From a recent comment, one way to say this is:

- "What you truly are is the non-material material whose only inherent property is being-aware, and which 'takes on the shape of' experiences on an 'as if' basis, including the experience of apparently being-a-person-in-a-world."*

There is no "my" and "your" experience in the sense of apparently-being-me or apparently-being-you being simultaneously experienced now. The experience you are having right now is the only thing that is happening. Although you can conceive of other experiences happening and meshing, and may even have experiences "as if" that is the case, that never truly happens (note: "happens" as in "events arising outside of this moment). The urge to try to resolve things in this way is really an artefact of only being able to think in terms of objects related in mental space. You can't really think-about this at all, in fact, because thinking is another experience, which is "made from" the thing you are trying to think about! (Again, see also: the Feeling Out Exercise in this comment.)

POST: If DJ'ing is just a "metaphor" then why do people say that the number in the header changes?

The change in the content of ongoing experience is real; the description or conceptual framework about that change is metaphorical. So, you can potentially experience a number change, just like anything else. You can have any experience "as if" (as in: consistent with a description based on the idea that) you have "jumped dimensions". However, the number changing doesn't of itself mean that dimensions exist like "places" which "you-as-person" transfer to and from. The number changing means that... you have had the experience of the number changing. Everything beyond that is story and metaphor.

So it's not a metaphor, but rather something that actually happens?

Right. It is true that your experience changes. That is what happens. And nothing outside of that. In your example, at one moment you see the number is x and at a later moment you see the number is y. But you don't actually experience "jumping dimensions" or "changing places" as such. That is merely a description or story which you can use to understand it. (Or, and this is the extra bit, it is metaphor that you might use to conceive of an intentional change in your experience.) There are many possible "explanations" which could fit that experience, actually - but none of them are "true" in the sense of being "what happened behind the scenes". In other words, in thinking about this, focus upon what you actually experience, directly. The experience of "seeing a new number" actually happens. The experience of "jumping dimensions" does not actually happen - although you might have the experience of "thinking about the change in terms of the concept of 'dimensional jumping'". Any explanation for an experience is actually just another experience (the experience of "thinking about a story of what happened"); it does not get behind the experience. It does not get to the nature of the experience, if that makes sense - it does not cause the change.

(For an approach to trying to directly recognise that there is no explanation that goes "behind" experience, try the Feeling Out exercise halfway through this comment.)

POST: Mixing things up?

Are you sure that this technics that you guys provide are for making a REAL dimensional jump

What would be the difference? If you have an experience "as if" you have jumped dimensions, what is the difference between that and "really" jumping dimensions? Is there a difference?

Similarly, what is "programming the subconscious"? I've never seen a "subconscious". When we do that, are we sure that we aren't just having experiences "as if" we are "programming the subconscious", but we aren't "really" doing so?

You get the idea.

POST: Explain (?)

is this real travel, or just "changing your experience", becuz i hear people say that you don't go anywhere, but i've also heard people talk about getting lost or something. So can i get a definitive answer?

Well, they amount to the same thing essentially: the experience is identical, there is no difference between "really" jumping and "seeming" to jump in experience. The idea that you "don't go anywhere" is a reference to that the usual assumption that what "you" are is a sort of person-object who is inside a world that's a "stable, simply-shared, spatially-extended place unfolding in time". In fact, when you think about it and examine it further, what "you" are is not a person after all, and you are not in a place. Rather, it is the experience of apparently being in a place which arises within you. Similarly: "jumping dimensions". Hence, you can't go anywhere, because you never are anywhere - you can only "change your experience" (because there is nothing else to change).

that's what confuses me. What causes the number to change then?

It's "intention - and the implications of intention according to the currently dominant set of facts and patterns". Think of it as collateral damage, from tugging on part of a blanket of material whose folds are the abstract "fact-patterns" of experience. You don't specifically decide upon the slight rearrangement of other folds that results from adjusting one fold deliberately -, nor can they be predicted (because that would be "pre-experiencing" then - i.e. basically just experiencing them - and also they don't necessarily correspond to thinkable concepts). From earlier, too: *It might be better to conceive the world as an abstract "coherent landscape of facts and patterns", where raising up one fact deforms the landscape around it, fits the world to that fact, regardless of spatial and temporal considerations. (And this entire landscape is within you-as-awareness; there is no outside to it.)*

this stuff is hellla meta

Indeed! It's meta... and then take one more step back. But don't let the descriptions bog you down; the "thing itself" is super-simple. You directly are it, the whole moment of experience, it's just that it's not possible to capture it in thoughts (concepts and words).

POST: Relevant, informational video on understanding dimensions

The actual theory (or better to say: underlying viewpoint) isn't structured around "dimensions" in that sense, as such - but as a way of detailing out a metaphor or conceptual framework for use (as per sidebar), rather than "how it works", it's all good. The lack of discussion might be due to people perceiving that. Or, of course, it might be because most people want "results", even though that probably doesn't get you anywhere longer term, and the experiments are best thought of as seeds for an investigation and contemplation into the "nature of experiencing"

POST: A few questions from someone who really wants to believe this is true

The sidebar text covers some of this I think. For example, you are not going anywhere, you are changing the content of your ongoing experience. It's not solipsism, because you are not the only person or mind. In fact, you are not even a person. You are not an object at all, you might eventually conclude. The assumption that you are a "person-object" in a "world" that is a "stable, simply-shared, spatially-extended 'place' unfolding in time" is one of the things under investigation. A recent discussion on the "person" thing can be found in this thread [POST: People around us]. Ultimately, though, it doesn't actually matter how you have conceived of it. You have to do the exercises as experiments, and then reach your own conclusions. If it was solipsism - if all your subsequent experiences were more consistent with that description rather than a "shared world" type description - then that's how you'd have to conclude it was. However, one of the possible outcomes is that the very nature of "descriptions" themselves one of the things that ends up under scrutiny. It might turn out that all experiential content is best viewed as being on an "as-if" basis only ("as if" a particular description were true, at the time of the experience), because no descriptions really get "behind" experience anyway. In fact, you might decide that descriptions are themselves just more experiences: the experience of "thinking about experiences". In the end, you might conclude that the only fixed fact, the only fundamental truth, is the fact that there is an "experiencing", and everything else is temporary and relatively true only. This would mean that what you truly were was something like a "non-material material whose only inherent property was being-aware, and which "takes on the shape of" states and moments of experience". Right now, you might have "taken on the shape of" the experience of apparently being-a-person-in-a-world - but that isn't what you are. This you-as-experiencer is independent of any particular experience; with you-as-person not being a thing at all (with "person-formatted experience" being a more appropriate phrase to use). Again, though, it's all down to: conduct experiments, ponder the results (if any!), draw conclusions, decide what is true and not-true for yourself. Anything anyone else says here is, after all, just the experience of "reading words on a screen", and right now you don't really know what, if anything, is "behind" that experience...

...None of that necessarily follows, surely?

The basic observation is simply that your ongoing experience is "made from" you-as-experiencer (or "awareness") - the context of experience. Apart from that, the present content of your experience needn't be one thing or the other, and it isn't of itself causal. For example, you can't refer to experiential content (things you read, for example) as if it were independent information. The encountering of that information is just a further experience. And it doesn't necessarily define the content of other experiences (although you might use it for a template, perhaps). If you-as-awareness haven't so far "taken on the shape of" the facts that you describe, by intention or implication, then you won't experience them (other than, say, reading or thinking about them). There is no outside "will" to do it on your behalf.

POST: n00b question: Can two glasses still work if you don't notice any strange changes?

If your target outcome doesn't have a component in the present moment, then there's no reason to expect to experience anything in the present moment. For example, if your intention is for an event to turn out a certain way next month, then why would you have a sensory experience about it now? The format of the intention could be described along the lines of "it is true now that this happens next month". Next month is when the experience of a result happens. If it is not strictly time-bound in that way, even then, you wouldn't expect an experience at a moment ahead of when the target fact actually becomes relevant.

POST: I dont understand

OmegaAces: Different perspectives and different experiences lead to different conclusions, this is why some say it's "just" a mindset change, and others say its "just" purely spiritual. The exercises in this sub are laid out in a specific fashion for open minded experimentation and contemplation. Not exactly something you do on a sunday afternoon and form a ultimate conclusion on 3 days later. Basically, extended experimentation (months to years, or longer) may change ones perspective on what "actual things", "reality" and such things are.

/u/OmegaAces says it as it is. Treat this as an investigation into the "nature of your experience" (and of "descriptions"), consisting of experiments and subsequent contemplation of the results. You're meant to reach your own conclusions, really, although all the relevant strands are in the sidebar text from the start. Ultimately, you are led to confront your assumption that you are a person-object located within a world-place. That is, whether the standard concept that "the world" is a "stable, simply-shared, spatially-extended 'place' unfolding in 'time" is in fact a completely accurate description of your ongoing experience.

POST: Paradox

It would only create a paradox if changing the present moment involved some sort of "replaying" of past moments in a logical causal sequence. If, instead, what was happening was an "assertion of a situation", then there would be no such restriction. You would simply be having the experience "as if" you were a person with no recorded parentage.

POST: Trying to reconcile apparent contradictions in DJ explanation.

Or is this the "brain in a jar" type perception, wherein your entire world is essentially a construct of your senses, and nothing beyond that holds validity?

There is no jar that is ever experienced, though, and even "a construct of your senses" makes certain assumptions about an external world that is being interpreted. The fundamental issue turns out to be, I'd say, the conception of oneself as an object that is located in some sort of place. We never experience ourselves as that!

In fact, we never experience ourselves as anything. It is more accurate to say that we are "that which 'takes on the shape of' states and moments of experience" - including the experience of apparently being "over here" and the rest of the room "over there". Consider: where exactly are you-the-experiencer right now, in this current moment?

You don't need to comprehend anything for it to work: the exercises in the sidebar, for example, are intended to be the start of you checking your assumptions about experience versus your actual experience. Actually: In fact, the nature of "descriptions" is itself something that is under investigation. If descriptions are themselves just further experiences - that is: the experience of "thinking about experiences" - then in what way can they ever get "behind" our main thread of experience? Are they not just "parallel constructions in thought"? Any ideas you have about experience are "inside" experience too - except that, importantly: experience has no boundaries, and so there is no "inside" or "outside", except as the conceptual thought about such a thing!

So I guess the summary is: there are only contradictions if you try to reconcile experience based purely on its content - trying to match thoughts about the experience with the main strand of experience as if one can "get behind" the other - without considering the context that applies to all experiences (which turns out to be: you-as-experiencer as the experience).

POST: Newcomer questions

The answer to all of these questions is: try it. Treat this as an investigation, where you conduct experiments and draw conclusions from the results.

It's just a little glass of water. How bad can it really be? :-)

Not bad at all, of course, relatively speaking. Well, no worse than allowing whatever sequence of moments you've already unwittingly defined as unfolding, anyway. There are a whole lot of caveats in terms of ideas like "the subconscious" and even "everyone around you", here. Our default assumptions cannot be taken for granted in these areas. Ultimately, there are no such things, not independently anyway, and experiences are best considered as being on an "as if" (things were true) basis, I'd say. That is, any "monkey paw" type warnings should not be taken too seriously, except in the sense that (as emphasised in the exercises) one should only intend outcomes one would find acceptable as experiences. Because you always get results, in some form or other. (Which you reference in a later comment I see, right enough.)

POST: "As If"?

I see that term come up a lot in discussions and am having a hard time wrapping my head around it, mostly because it's kinda thrown in there casually like certain acronyms or secret lingos. Can someone please explain why they term keeps popping up and what it means?

It's a way of saying that the experience you are having is apparently consistent with something being true, but that it is not fundamentally true. So, you might say that right now your ongoing experience is "as if" you were a person-object in a world-place, "as if" there was an "external world" that was impinging upon your "sense". The content of your experience is consistent with a description based around those ideas. But: that description is not what is "really happening" when we take into consideration the context of experience. What is "really happening" is more like you-as-experiencer has "taken on the shape of" a particular state and sequence of moments, and so there is nothing "behind" or "outside of" that experience at all. Of course, that there is also a description, but unlike the first description, it is intended to point to something you can notice directly about experiences, rather than something that is "true" in terms of content. The first description is like a model, the second one more of an observation or line of investigation. This connects to the notion of direct experience or "direct truth", verses "conceptual truth", and the Feeling Out exercise mentioned elsewhere.

POST: Protip for people failing 2cups and Mirror Method

Chipping in with some general thoughts:

Do not ask for money (too abstract)...

I would also avoid the concept of "asking" (or "wishing") at all. It's more in the manner of a direct update to the patterning of your ongoing experience - see below. For sure, you can produce some experiences "as if" you were talking to a universe and getting responses, but actually those experiences would themselves be direct updates also. You can ask for "money" but you should have a good sense of what exactly you mean by "money". Sometimes people avoid being too definite, sort of superstitiously. But being clear about the target, even if not in the details, is helpful I think. You don't need a big description written out - you just need to "know" it. And: Ultimately, all that we ever experience is... experiences, moments. So I think it's beneficial to have a sense of what a target outcome means in terms of experiences. Otherwise your intention for "money" is like the Owls of Eternity experiment: you will probably see a generalised extended pattern of the idea of "money" become more prominent in your experience, without any specific target event taking place.

the universe can't give that to you because your consciousness can't find a version of you that isn't so deeply flawed state.

Remember, too, that, as per the sidebar, "dimensions" or "universes" are best thought of as being a metaphor which describes being in a particular state. They are metaphors upon which a structured intentional act is built, leading to results formatted by the conceptual framework or pattern of that metaphor. In this description, "the universe" doesn't give you anything and "your consciousness" doesn't find anything. It is much more in the manner of a "dumb patterning system". That is, your intentional act is simply an increasing the prominence of a particular fact-pattern in your ongoing experience - dragging into play any logical implications required for coherence, since your experience is a single thing, not made from parts. It's like grabbing a bit of a landscape and pulling it up to make a mountain. The mountain is your new fact, the rest of the landscape is deformed to accommodate it. However, there is no separate "intelligence" doing things or working things out. You are the only intelligence, and what you are doing is changing you state by shape-shifting yourself.

If you're having difficulties try smaller specific jumps that affect yourself more before trying bigger jumps.

It's definitely true that, in terms of investigating the "nature of experience" here, starting off with target outcomes in your everyday life (things you would consider highly unlikely but not reality-rule-breaking) is sensible. And then build out from that once you've demonstrated ("demo exercises"!) that there is "something to this" (or not, of course). But: pushing against our assumptions of what is possible and how the world is (are we a person-object in a world-place that is a "stable, simply-shared, spatially-extended 'place' unfolding in time"?) is ultimately exactly the point of all this, so there's no need to be too timid! Swapping the limits of one description for another would be a missed opportunity - especially since the nature of descriptions, and their exact relationship to our ongoing experience, is also one of the things under investigation.

Is it possible to jump to one that's very different? Sure, the number would change in the sub.

I'd highlight that this isn't necessarily the case. There is no reason why the sub header need alter along with any other fact or pattern, no matter how dramatic the change. From the sidebar text: **Header No. 982** - Please note that a shift in your experience does not require a change in the header number, which should be treated as an emblem of change and a symbol of potential rather than an ID.

POST: Escaping the system, to true reality

Thing is, no matter what world I jump to, I'm still trapped within what is ultimately a false world.

There isn't a "real world" in the sense of a place. "Dimensions" aren't places, they are more like states. Ultimately, they are just different experiences, all at the same "level", with none being any more special than any other. It is all you-as-experiencer having "taken on the shape of" a particular state and the implied moments of that state. So, you are not trapped anywhere, because you aren't anywhere; you aren't an object and so you never have a location. Any apparent location within a place is just a part of the "as if" (as if it were true) experience you are having. All experiences, then, are the equivalent of "reading a book" - but in the sense of all books being within you, a library "dissolved" into the background of you, and you selecting one or the other. You might arbitrarily select the "void experience" as the ultimate version, I suppose, since in that state you are not "reading a book" at all (see for example the description: here). But really it is just another "shape" to adopt.

the world that contains all other dimensions as well as the substrate that robustly maintains existence and explains how there can be something from nothing?

There is no "world" that contains all dimensions (because there are no places as such in the sense of being "containers"), and no substrate maintains anything (since that implies some sort of ongoing activity holding things together and a solid "material" of some sort). You might say that you are the substrate, in a sense, because you-as-awareness are all that is: the only thing that is fundamentally true is the fact of the property of being-aware. As for "something from nothing", one way to consider this is that all things - all facts and patterns - are eternal. All that changes is which facts and patterns are brought into prominence, with a particular set of relative "intensities" corresponding to your current "state". See this previous comment and links for more on that [POST: Who are You?]. Aside - It's worth reading some of the stories of Jorge Luis Borges for some interesting ways to conceptualise worlds and patterns, perhaps - particularly The Library of Babel, The Circular Ruins and The Garden of Forking Paths. They're all ultimately different versions of the Infinite Grid metaphor referenced in the sidebar, but they're fun to play with.

Could you expand on what you mean by "level", and why it is that different experiences are always at the same "level"?

So, what I'm try to get at here is that if you were to have an experience of, say, finding yourself transported through multiple universes, seeing strange scenes, all different kinds of life, and having an interaction with some beings who told you about the secret structure of reality...

You would not in fact have gone any "deeper" into the nature of yourself or the world. None of those experiences would be any more special than your everyday experience; they are still just further content made from "experiencing" and within or as the context of you-as-awareness. That is, an experience of "digging into the deeper levels of reality" is in fact just that: an experience, actually at the same level as any other. Similarly, any thoughts about a deeper level, your descriptions and explanations and models, are also just at the same level: parallel and simultaneous rather than behind or underneath. A shorter way to say this, is that the realisation of a "real reality" being looked for by OP here is actually the "meta fact" that applies to all experiences (the very fact of you-as-awareness taking on the shape of experience), and not something that is contained within the content of any particular experience.

POST: Glad to find this sub!

In regards to the post on the two glasses technique I want to point out for those new to it, that you must focus on the result of what you truly want, not on what you don't want.

I would emphasise for that exercise, though, when performing it as an experiment: just follow the instructions as written. Don't "focus" on anything in terms of straining, no effort or concentration is required. There is no actual mechanism at work here, it is far more direct than that. And then follow the final instruction (which is basically: don't interfere afterwards).

So instead of focusing on the mechanism to get the result you want, focus on the result

I'd definitely agree with this. (And nice story.) One could perhaps conceive of this as "inserting a fact into the world": If we think of the world as a single landscape, one continuous coherent pattern which completely defines the world, then to assert one particular fact as an outcome inherently involves a shift in the landscape around the two defined points: now (which is fixed because you are experiencing it unfolded as a sensory moment) and then (your target which you have fixed via intention). It becomes "true now that this happens then", and all of it is present now even though only one moment is "unfolded as the senses". So, any apparent mechanism is only a seeming mechanism, when viewed afterwards. In truth, we just experience a sequence of moments, aspect of the landscape, pre-determined by the facts within our patterning. The actual cause is always intention: the assertion of a particular pattern as true, incorporated into the existing world-pattern, which is really a patterning of ourselves. Everything else - all experiences, even those that are apparently "causes" - are "results". Meanwhile, I'd say that "believing" is optional - in the sense that it doesn't cause anything if it's just an occasional thought about things - but it does make it more likely that you will fully commit to an intention (and since intention is a direct shifting of yourself, with nothing interpreting a request or whatever, a "sorta" intention equals a "sorta" update), and definitely assists you in resisting the urge to tinker and interfere and engage in doubtful reflection afterwards. For clarity, it's probably worth making a distinction between "believing" an idea versus intentionally fully "patterning" or "formatting" yourself with it.

POST: Shifted to a New Awareness/View of My Cats?

[POST]

This is long. Sorry! Well.... Over the past few days I've realized that Triumphant George had posted many gems of information both here and on another site, Oneirosophy, that I had not yet thoroughly read. So, last night I began reading through a lot of these and really pausing to give each one some deeper thought (for instance, the Hall of Records, the Imagination Room, and the wealth of ideas here: [https://www.reddit.com/r/Oneirosophy/comments/2r39nc/overwriting_yourself/] - and in several other posts). I was aware of some sort of deep change in my perspective as I kept reading these (although I've experienced plenty of "changes in my perspective" already!); something really seemed to "take hold" as I pondered and mentally experimented with some of these new techniques and ideas. The first thing that happened after this, that I recall, is that - still on the computer - I did some web browsing and encountered several synchronicities in a row that startled me a little (although I'm pretty used to synchronicity and "magical happenings" that come and go,) and the content of them was so important to me that I wrote them down. Honestly, I would share them here, but I've found that sometimes another person's "startling synchronicity" just isn't read as such by others. Maybe I've spent too much time on GITM (silly me) where the main idea seems to be to "shoot down" every poster's "glitch" ;-/ but I feel it best to keep the details to myself, since those aren't the "main event" in this post, anyway. Before I proceed, as an explanation I need to say that I live on a rather busy street, my cats never go outside, & part of my small-ish home is really not in use right now so my livable space is reduced from what it used to be. Also, those of you who have had cats know that if I just "locked them up" in a room at night, they would meow, yowl and howl pathetically all night! Which would hardly be restful for any of us. ;)

Sooo, it wasn't too late but I was very sleepy. I left the computer and went upstairs to sleep. Now - I have 5 grown cats. They've slept with me for a long time, but until about 3 1/2 years ago, I was in my double bed and there was plenty of room for 1 human and 2 or 3 cats. Now, however, I actually sleep on a sofa (I won't go into why at the moment,) and the cats kept getting, from my perspective, needier and needier and more and more invasive. So for at least 2 (more like 3+, I think,) YEARS I've been trying to sleep with one cat draped about my head, chewing on my hair, pawing at my face, another cat sniffing at my nose and tickling me with her whiskers, and another cat pawing at my feet.... You get the picture! The obvious result was much disturbed and thwarted sleep, and me feeling a lot of irritation toward my poor kitty cats. My oldest cat has never been a lap cat or very "touchy", but at the elderly age of 15 last year, even she decided to become a lap cat and now insists on sitting on my lap for 1/2 hour every evening before bedtime. Anyway, so - on to my point. I had read all these articles and posts by "TG", seemed then to feel some sort of inner shift... then experienced a rash of synchronicities, and then went up to "bed". Last night, I didn't do "two glasses" or anything really deliberately, but I sort of felt... filled with love, or... I dunno! As I sat with my cats, (a couple of whom also do things like race about madly, scratch up the sofa, and get into "tiffs" with each other,) I was led or drawn to appeal to their Higher Cat Selves. I remember petting them very lovingly and thinking that I was appealing to the "Magnificent Heart" of each of them. In this "appeal" I wasn't really asking for anything too specific, but there was a very silent, (sort of deeply hidden within me so that even I was not very aware of it,) INTENTION: peacefulness - goodness -. I hope this is sort of clear. Seems hard to express. So, during this "petting" time of about 1/2 hour, at one point my big orange cat, Sam, raced over and began to claw (with great gusto - you'd have to know Sam!) at the sofa I was sitting on. I sort of just... thought about his "Magnificent Heart", his Higher Being, and he stopped right then in mid-scratch, jumped up on the back of the sofa and began to snooze! I just thought, "Gee" or some such. I finally lay down, very tired. William, my other male cat - big, orange & white, and fluffy -

jumped up onto the pillow above my head. He chewed on my hair and did his usual annoying tail-swishing, etc. One of my female cats had taken some of the cover off my feet. In this somewhat uncomfortable - and perfectly usual - state, I began to drift off to sleep, still with thoughts of some of TG's writings in my head. I was still slightly awake when William jumped up suddenly from the pillow he was sharing with me, and down onto the floor. Sam also got off the sofa, as did Annabelle (little cat at my feet). I didn't think too much of it as they will go to the food bowls or to get water at night, but they always, always come back. I just snuggled down to enjoy my very temporary (I thought) Sole Occupant of the Sofa status, since every single morning I awaken in some more or less uncomfortable position, basically "covered in cats". I usually sleep very poorly and wake up several times at night due to cat-related discomfort. Except this time, I didn't. They weren't there. (!!!) This may seem like a small thing, but when my alarm went off and I realized there wasn't a single cat with me, and I was awakening from a very peaceful, undisturbed all-night sleep, I was stunned. It seemed that, when they left the sofa as I was drifting off to sleep, they stayed off. I sat up, and after a minute, slowly the cats came in from the other rooms, one by one. I was going to write that I have no idea how tonight will play out - when Sam (my most "in your face", high strung kitty,) jumped onto my computer desk and did something he has truly never done before. Instead of sitting or standing in front of the monitor, blocking my view, and meowing insistently in my face, he has politely lain himself down off to the side so I can still see the whole screen. I have seen what seems to me to be an extreme change in some cat behavior that was totally entrenched over a period of about 3+ years, and I hardly know what to make of it. All I know is, I FEEL "shifted". And I didn't DO anything. I just assimilated & allowed new perspectives in.

[END OF POST]

Q1: I just said thanks to n8dawg189 & BraverNewerWorld for not calling me a fruitcake! :)
And I wanted to follow up just a bit. Last night I fell asleep with a kitty (William) by my head, and this morning I woke up - once again "sans cats"!!
I just don't know....Also, another change (big change, in terms of my state of relaxation vs irritability,) is that my cats were not "under my feet" either last evening or this morning. For quite some time, (years, that is,) I haven't been able to go up or down the stairs, walk from the living room to the kitchen, etc. without having cats - especially William, Mary and Annabelle - "accompany" me by racing ahead of me and then stopping in front of my feet. If I go to my small bathroom, the pattern has been that 2 or 3 cats race in there ahead of me, throw themselves down on the floor and roll around, etc. (Yes, they're cute! :-)) - but, convenient, it isn't. There's hardly any room for me! lol)
Well, this morning I went up to the bathroom and William walked BEHIND me up the steps (unheard of, I swear,) and then he didn't actually go into the bathroom, at all. He sat in the hallway for a while. All my cats, (except for the oldest, Claire,) are behaving very differently. I'm trying not to misread modes of behavior that were always there, but just unnoticed, as new. Trying to be logical and honest with myself about what's going on. However, over the past couple of days, there are behavioral changes in my cats that I just can't deny. I sort of feel as if I have...well, (gulp) different cats, somewhat. I'll just relax and try to be observant without losing all my common sense.
Edit to say: I'm at work so not really in "Dimension Jumping Think mode". I wanted to clarify that I don't really believe it's a matter of actual "different cats", but rather....shifting to a state of consciousness where I - well, I've created them to be different! (I'm truly something of a solipsist these days, I think.) I've created changes in the past with thought alone, but 1) not on purpose; 2) still, in such a focused (though unintentional) way that I was able to look "back" and see very clearly exactly how I did it. Nice to find myself doing it with positive intention. In the long run, I just want comfortable me - and comfortable, happy cats!*

Not different cats as such - but maybe different cat patterns, eh? :-)

Aha, a secret is revealed! To shift patterns one must love seamlessly whichever pattern is present and silently intent/reveal/flow with the heart into the desired pattern. It has to feel as if you almost aren't doing anything at all, only allowing what you really want to happen by appealing to a Higher Authority in a humble, unobstructed trust. Hmm, very cool. Thanks to everyone involved for helping me think this out :)

The "higher authority" part, I would emphasise, is simply you providing yourself with an excuse to not interfere with what you've already done via intention - to let it unfold without re-intending again due to doubt. Once you have intended something, the new deterministic experiential path is set!

You are the only intelligence, everything else is a "dumb pattern".

Meanwhile, since intention has no specific sensory component (you don't "do" intention so much as "shape-shift" to a new state where the intentional pattern is prominent), there is no sense of effort. You didn't do anything; you-as-experiencer became something. In OP's case, they intended-that they would read some "active metaphors" and allow themselves to be re-patterned by them. And at that point the new pattern was fixed and the subsequent experiences determined.

(As with all of those things, it's much easier to do some experiments and know it, than it is to discuss it intellectually and try to "understand" it!)

Q1: Yes, it certainly is a challenge to discuss "things of the spirit" from an intellectual perspective. Sort of makes me think of, "The letter killeth, but the Spirit giveth life". Also, while I'd like to avoid mangling things up with a new "slant", there was definitely a sort of trance-like element to the way I was feeling the evening the change occurred. Have you ever had a dream, read a book or watched a movie that "caught you up" so much that you were sort of floating around, not quite grounded in your "real life" for a bit? That's not a perfect comparison to how I was feeling, but somewhat. I think the "shift" actually may have occurred while I was reading and so deeply contemplating those new concepts. By the time I went upstairs and spent time with my cats before sleeping, I was already mildly "entranced", immersed in the ideas I'd been reading about - and the brand new thoughts about my cats, such as their "Magnificent Hearts", just came to me out of nowhere. Not planned, at all. As TG has noted somewhere, my viewpoint had already switched - and I provided myself with a path to the recognition of the new viewpoint. (Ha! sounds so complicated.) When I "got in touch with" my cats Higher Selves, by the way, I sensed them, not as something like Big Noble Cats, but more like...very benevolent royal Beings, with their spirits "equal" to my spirit. It was interesting. I really, really appreciate this sub for being a place where such experiences can be shared and discussed! You guys are great. By the way, that "change" was Wed night, and it's now Friday night. My cats are still shifted/changed/different - and believe me, while I can write all this High & Mighty, got-it-together stuff, there is a very earthbound side of me that finds this very freaky!! I've had brief moments of staring at them like, "Who are you??" and wondering if I should rush them all to the vet! (lol) - They are fine, actually. I'm pretty sure.

They are probably the finest they've ever been! But it's interesting, isn't it, that having an actual experience is a bit more destabilising than one might expect in advance, no matter how enthusiastic one has been about contemplating "such things" beforehand. You can see how some people intuitively sense that perhaps they don't really want the miracles they are hoping for, since the price you pay is possibly a re-evaluation of the nature of things at a fundamental level.

Q1: Well, I'm sure everyone is sick to death of me posting about my cats, at this point, but I just have to post this. If anything would convince me that some change has actually occurred, and I haven't simply gone cuckoo, THIS (oddly, perhaps, but that's just me...) is it. I adopted Sam as a tiny, abandoned, bright orange (so cute) kitten in 2004. Once he started eating cat food (he got kitten formula for a short time,) he was strictly a fish or turkey guy. He would not eat chicken in any form, to my surprise. He wouldn't eat any kind of cat-food chicken. My sons and I tried giving him home cooked chicken, fried, roasted, braised, store-roasted chicken, KFC chicken, white meat, dark meat.... It didn't matter. He would look at us as if we were nuts to offer him something that was clearly inedible, and he would walk away. So, I seldom eat any chicken any more, at all, but yesterday there was a party at work and a ton of chicken tenders left over, so I brought some home. (Hey, free food....)
So, this morning for a snack I'm having some chicken and Sam wants some. I remove all the mildly spiced breaded coating and give him some white meat. He gobbled it up!! I am not kidding. He just ate a bunch of chicken. (Now he's meowing. I wonder if his tummy hurts.)
omg. It seems I have to get used to cats with a whole new set of "stuff"! (I need some chocolate immediately. lol) Jeepers. This is SO weird. In fact, it's so weird, I just have to try it some more. :-D
Edit to add: This is certainly the last time I'll post on this specific topic. (Enough is enough. :) I think everyone who finds it possible to "believe" is now aware that apparently I've had some kind of "shift" and may continue to see small bits of evidence of it as I "move forward in time".
Of course I'll post again if I perceive some totally unrelated, truly significant "shift"! Um - That is, I'll post again if reddit exists in my awareness after I've shifted (should I "shift"...)! Thank you for all your comments! Wish I could meet you all for coffee or something. :)

Good stuff. It's always been a concern with this subreddit that there has been a distinct lack of cat-related material - which, as we know, is the true mark of success on reddit and the internet at large. No longer! I just hope your cats are inclined to play along nicely with owls... :-)

Q1: Ha! I was going to stay off this thread, but... Yes, I probably should have included links to cute pics of my cats. Would've gotten "Gold". OWLS - I didn't even do the owl thing, just read through it. Yet I see them all the time. Decided to walk a different route to my bus stop Friday morning, and there was a car parked by the curb with a big stuffed owl on the dashboard. Last night (Saturday), I was looking at pics online of a home for sale, and in the living room of that home there was a large owl figurine on the coffee table. On and on, owls everywhere. I want to apply it with something far less popular, such as snails or hippos, and see what happens. :) Fun. You are my primary mentor at this time, TG. I have (just for the moment,) set aside Neville, Kidest, Fred Dodson, Bashar, all my New Thought folks, et al - and am diving in to study and apply the info in your writings. I wonder if you ever think of putting out a small book (?).

This is one of those threads where if you keep tugging on it, you find a whole sweater! Oa whole sheep! :-)

So, all the people you listed do, I think, give you a different starting structure that provides a path or "formatting" by which intention is filtered. Neville Goddard, with his references to Blake, is slightly more direct about it all, but regardless, what's actually important is realising the nature of experiencing. That's really the ultimate aim. If you realise that - infer the context of experiencing vs the content of experiences - then you don't need a mentor or a structure at all. As your post indicates, if you allow yourself to be fully formatted by an idea of "how things work", a metaphor, then you will have experiences "as if" it were true. Realising this, you just pick your metaphors wisely, choosing the most flexible. I really think that if we fully commit to directly experiencing ourselves as the "open awareness" which formats itself by imagining-that, there's nothing else to learn. All descriptions about it are merely parallel constructions in thought, inside it.

POST: I would love to hear your feed back on this video - is he accurately describing DJing as you understand it or experience it? OR is your experiences with DJing different than he describes? If so, how are they different?

Just to start: I don't think it's very helpful to define a "reality" as every change in experience (which is essentially what he does), because it makes it kind of a meaningless concept. However, if we define a "dimension" as a particular "state", meaning a set of world-facts from which follows a deterministic set of moments, then we've got something more manageable. In this view, when we deliberately intend a change, or imagine-that something is true until it becomes fact, then we have shifted our state (really: our-selves). Our subsequent experiences then arise spontaneously from that state. From there, it's not so much that you have to "start acting like the new dimension you jumped into is really there" - rather, you have to not obstruct or react to the sensory experiences that arise, including the experience of apparent physical movement. If you oppose the moments that then appear in your awareness, then you are in effect re-intending against them - and hence shifting state again. In summary then, we're really talking about:

- Adopting a new state and then:
- Not accidentally intending against that state.

For this to make sense intellectually, though, we really have to reconsider what we think of as "me", which leads us to philosophical idealism or non-dualism. You are not a person in a world doing magick or attracting things across time and space, for instance.

Honestly - you seem to be drawing VERY subtle distinctions between your understanding and what Bashar is saying. I'm not sure I even see a difference or even understand the difference you're highlighting....but I'll think about it, meditate on it and try to understand what you're saying. But regardless of all that - I don't want to sound ungrateful so thank you for your reply.

Well, do remember that this is not an understanding of something that independently exists as such. So there's an element of "whatever works for you" to all this. The only thing that truly matters, is that we recognise the distinction between the nature or context of experience (fundamental truth, you might say) and the content of experience (relative truth). Everything else is up for grabs, potentially. "Very subtle distinctions", then, are worth attending to, because how we conceive of the world shapes the structure of our experience. The benefit in drawing the line of the definition of a "dimension" at this point - of a world-state rather than something akin to "what I am grossly experiencing right now" - is that it logically follows that you can have effortless experience with occasional redirects. It's more obvious that you do not need to maintain anything, and so on.

Also: no aliens! [1]

[1] Unless someone particularly wants aliens, of course, in which case they can totally go for it. :-)

Q1: *"Very subtle distinctions", then, are worth attending to, because how we conceive of the world shapes the structure of our experience. This is exactly why I said I wanted to think on this further because I'm not afraid of subtle distinctions - but sometimes they're a distraction. It's the old analogy of you can't see the forrest because you're too focused on the trees. I had originally been thinking this thread would address the differences and/or similarities between DJing and Bashar's ideas but something about your response is making me think much deeper about all this.....which is actually quite fun for me so thanks. I'm not not nearly "up to speed" on all of this so it'll take me a while to process.*

Yeah, it can be easy to get lost in formulations for their own sake, forgetting they're about constructing something useful rather than discovering something. (The exception being the discovery of our direct experience of ourselves.)

The subreddit overall is intended to be fairly concept-agnostic - hence the idea of "active metaphors" referred to in the sidebar and links. The underlying idea is that there is no particular "way things are". All changes are basically the intentional "patterning" of our experience/ourselves - to different levels of granularity. So, "dimensions" and "frequencies" and "grids" and "states" and "facts", they're all potentially useful as self-formatting patterns; none of them are inherently true. Anyway, thanks for kicking off the discussion.

Q2: *Not accidentally intending against that state. Could you please give a few examples of accidental intending?*

So, one form of that would be you reacting against an experience that arose as part of the state's path to your outcome - either because it seemed unpleasant, or because you can't see how it fit in, or you were trying to "make" things happen by directing them in a more micro way. For example, perhaps as part of the sequence towards my outcome, circumstances force me into meeting up with someone who I find intimidating, and then they are intimidating, but my spontaneous response (rather than my reaction) is to stand my ground and say something out of character, and that resolves that situation and leads to my outcome in an unexpected way because that person has direct access to what I want. Throughout all this I have to trust that the deterministic path, the path that has been created as part of my outcome-focused state-shift, is heading in the right direction, despite my fear and discomfort. I must do this even though I can't know it in advance exactly what will arise along that path, because I can't "pre-experience" my experiences and it's never possible to think it out. In exchange for that faith, I benefit from the entire "world-pattern" having reshaped itself as a coherent whole around my intention, in a way that could never be planned using my basic thought model of the world. However, to benefit from it I must surrender to it. Any resistance to what then unfolds in my senses is an intention against my current moment, but also the whole state. Since your state or "world-pattern" is a continuous whole - like a blanket of material with folds in it - to intend against one part - to tug on one fold - is to shift the entire world. (However, I'd suggest a strong outcome intention will not be completely mangled by a minor counter-intention that isn't directed at the specific outcome itself.)

Q2: *it's never possible to think it out What exactly is "thinking it out"? And how would thinking it out be different from not resisting the sensory experience that arises as thought itself?*

In this context, the manual construction of a parallel structure in thought, which is then used as a plan for what needs to be done to reach one's goal. Perhaps "work it out" or "calculate what to do" might have been better ways to phrase it. The basic idea is, you can't "understand" the world enough to choose the correct action, but the information is there so that you can "know' what to do towards something you've intended - because it is the movement already occurring within you.

we might even just call it perseverance

Although for some people that word can imply struggle and effort and pushing, perhaps? The best words are probably "trust" and "faith" and "confidence", if we can put aside any religious connotations they have in the context of action in the world (not necessarily a bad thing, since that's where the concepts probably came from originally, but just associations that are unneeded). Maybe a blend of both.

Q2: *Although for some people that word can imply struggle and effort and pushing, perhaps? Yeah i intended it to come across more as "overcoming challenge," which probably blurs into struggle... for some people.. maybe. but i think if you know or have faith, trust, confidence etc, that you get to your end outcome, then it seems to make it more about upping the quality of that experienced moment and the implications following, which can mean struggling if struggling means-that your results will be, overall, better. Maybe not though, struggling could just be struggling.*

I suppose we might suppose two levels for convenience, something we often have to do when discussing these topics. There is the "experience of struggling" as content - really just part of your sensory adventure - and then there is "resistance struggling" as context - which is when you-as-experiencer push back against the sensory adventure itself. For example - using a retro film reference - if we were Indiana Jones in Raiders of the Lost Ark and we had decided we were going to find the Ark of the Covenant, then we might experience many struggles along the way, but those would be part of the "sensory adventure", and in fact our outcome would already be assured. However, we are simultaneously the actor Harrison Ford, and if we as Harrison Ford struggle against the unfolding of the adventure, of the script that is arising in our theatre, then we might derail that outcome, or at least (more likely) make the path longer and more punishing.

Q3: I must surrender to it.
Like Jim Carrey in "Yes Man"? :) But isn't there a limit to what we can say "yes" to? I'm ok with tackling a challenge that forces me to face my fears, making me stronger... but what about "deal with the devil"/"indecent proposal" kind of situations, that force us to violate our moral code? Should we embrace those too? Can we intend a different path without changing the destination?
a strong outcome intention will not be completely mangled by a minor counter-intention
How do you know whether or not your path has been completely disrupted by a negative reaction and is no more headed in the right direction?

Haha, no, it's not a Yes Man type deal. It really simpler and more basic than that: to give up micro-controlling in the sense that you think something "should" unfold a certain way, and to not let your fear lead you to avoid things. We might draw the comparison with body movement more generally: you don't actually need to control your body muscles "manually", and actually doing so tends to bring about inefficient and tension-producing results, because you can neither know what your body "should" be doing, nor consciously make it do such subtle co-ordination. Instead, you should intend the outcome (e.g. getting up from the chair; catching the ball) and let your body move by itself. However, until you've had that experience - there there is a movement that arises spontaneously in response to situations - then this probably doesn't make too much sense as a recommendation. Without a certain confidence or faith, there's the temptation to intervene and try to "make" the result happen - which has based on your crappy limited idea of the world. (In the specific case of body movement also, many people are constantly asserting their current position, and then overcoming it in order to move. So when they "stop interfering", they can feel sort of stuck for a while because they haven't "ceased asserting". We might wonder to what extent we continue to assert aspects of our world-state.)

So, what we're talking about here is the larger version of that - not just the experience of body movement, but of world movement. As far as disruption goes - I'd say that the outcome is never fully de-incorporated, but by asserting something that is counter to that outcome, you have at least reduced its relative intensity, its relative contribution to your future experience. If you feel you've lost your way at some point, then re-intend?

when we are learning a new movement (dancing, sports, etc.) we have to control our muscles "manually"

Obviously we've talking about intending other sorts of outcome here, but when we learn a new body movement, I would still say that we don't have to move our muscles manually really, as such - and that attempting to do so gets in the way, actually. We still direct ourselves towards outcomes. We shouldn't be trying to co-ordinate our muscles directly ever, I suggest - largely because we can't. We have no access to them in that sense. If we try to control muscles directly, what we in fact do is generate an experience of "controlling muscles", rather than generate an experience of "body moving as I'd like". Approaches such as Ideokinesis and the Franklin Technique for dance, or the Michael Chekhov approach to acting, or the Alexander Technique for general movement, follow this route - using intentional imagery or merely outcome-intention in order to bring about movement. Neurones don't have much to do with it (in the sense of what "we do" or what "they do"). If you haven't checked out chapter four of the Michael Chekhov Handbook: For The Actor yet, it's worth a look if you want to do some body movement experiments using intention: see here.

Since we can't know in advance exactly what will arise along that path, it seems to me that we have no GPS for manifesting.

Why do we need one? This assumes we need to progress step by step, as if we are walking across rocky and uncertain alien terrain. The is the opposite of how we want to go about things! Once the landscape is set - the deterministic path of moments is chosen - we don't need a "GPS". Again: the path is already set. We just need to not derail what we've done. If we are in doubt, we might periodically assert the outcome, but we shouldn't be "checking ourselves" (even just because of what that implies). You are not navigating a landscape, you are the landscape - even though you only perceive a slice of it in your senses at any one moment - and your intentions work by changing the contours. If you stop fiddling all the time by intending stuff constantly due to doubt and reaction, if you stop "thrashing your world", then you don't need to keep correcting yourself. The moments of the landscape "move through you" as the-perceiving-space; you don't go anywhere. To use another metaphor, we might conceive of an intention as inserting a particular scene later in our script - and by the magick of movies, the script from now to then immediately rewrites itself to lead us there. So long we we don't do another rewrite, we just need to let the movie play out. We don't "do" our character, we experience it.

...claims that sometimes he gets error messages from the "ethereal software" he uses to heal or manifest

As for ethereal software and error messages, all that's doing is adding another layer of "how things work" on top of something that is, in fact, super simple. Sure, you can have experiences "as if" that's how the world is structured - but you're still just intending something extra you don't need (namely, that there is such a thing as "ethereal software" and that it gives you messages). Why not just go straight for the outcome and let it play out?

EDIT: I get that you might want to "check" the outcome, but I'd suggest that since there is no way to do this independently (the intention behind the action implies an outcome in itself), it's probably still better to continue to intend the outcome if you have doubts.

So, I'd maybe summarise this as:

- When you intend something, you are directly updating your "landscape" of upcoming moments with a new fact, incorporated into your existing patterning.
- All intentions are basically of the form "let my experience now unfold as if 'this' were true".
- The 'this' might be an event ("let experience unfold as if 'I get the job' is true") or a general fact ("let experience unfold as if 'there is such a thing as ethereal software'") and so on.
- It's up to you how much "mechanism" you explicitly or implicitly introduce into this; but there is no real mechanism behind the scenes. There is no "how it works"; intention operates "before" that sort of structuring.
- "Checking" is also potentially an intention to have a certain experience. Are we then going to check the checking? And so on!

To emphasise: We have experiences "as if" certain facts were true, but no fact is fundamentally true. There is no way to get outside of this and be an independent navigator or checker.

Body Movement Experiments

But it's ineffable.

We are, here, at the boundary of what can be discussed! Once you have the experience, it makes more sense. So, visualising (visually or kinaesthetically) is also a result of an intention, really. The intention itself isn't "anything", because it is the change in state. Or to be clearer: the "intention" is the potential pattern that you are increasing the intensity of; "intending" is the name we give to that act of intensifying. Anyway, putting that aside, you got some minor twitches. Something to check, then is that you are not also simultaneously asserting your current position as you do this. In other words, are you holding onto your current position so that you can move from it, instead of fully committing to the target position? It is very easy and common, I think, to end if "wishing" the target state and "wishing" your current state at the same time - to "ask" to both move and stay still simultaneously! The actual experience is more of a releasing into the target state. One idea which might help, is to conceive of yourself as containing all possible positions simultaneously - it's just that your current position is "brighter" than the rest. You are therefore permanently in a state of elastic potential, primed for movement in any direction, and it's not a case of deliberately moving in one of those directions, so much as ceasing to obstruct yourself in that particular direction. Meanwhile, another way to stop yourself getting stuck in a "visualisation as cause" trench, is to do something more basic. Every day, just lie on the floor. Then, having decided that your body will get up, do nothing at all. Importantly, don't engage in staying-lying-down either. Just let whatever happens, happens. Eventually, your body will stand up, effortlessly and perhaps in a manner or sequence you could not have predicted, "by itself". At this point your recognise that intention is perhaps best thought of as "inserting facts into the background", which later arise in your sensory theatre. It just so happens that we have become used to thinking of only intentions associated with immediate results as being "us doing stuff" - in addition to confusing the result of muscle tension with the act of intending.

Checking For Results; Feedback

[Checking for result] I don't understand what you mean by "independently".

If you have done something which you have decided or intended means-that a future event will occur - there is no way to check whether that event will happen without interfering with it. The act of checking implies something, because it has meaning. For you, the act of checking now might mean-that it is doubtful that the event will continue to be true then.

With Chekhov's exercises, for instance, you actually have a feedback.

Yes, because you are intending something whose sensory result is within the current moment, more or less. Beyond that - when intending a future event - you would be seeking sensory feedback for something that has no sensory component in the current moment! (Although the exception to this is that there can be a subtle background felt-sense of your overall state.)

This is where doing that lying down exercise might assist, because you will have the experience of having intended a future event ("standing up"), doing nothing about it or to interfere with it, and then it happening "by itself" in a later moment. You probably need to conceive of your situation differently here. One helpful analogy: your ongoing experience can be thought of as a deterministic landscape or sequence of "sensory moments" across which your "sensory attention" scans. When you intend something, you shift that landscape. If the part of the landscape you are changing happens to be the part you are looking at, you will "feel yourself doing it" because the result will be visible in the very next moment. However, if it is a part of the landscape you aren't looking at, you won't have any sensory feedback until you get to that moment - minutes, weeks, months later. It is true now that the result happens then, it's just that you aren't experiencing then, now. (Whew!)

Asserting For Outcomes

Well, you should know the answer [whether it is best to just assert the outcome], or you wouldn't have created the Two Glasses method... :-P

Haha, well, I'm me, y'know? :-)

Yeah, "how to assert/intend properly" is the key, but as we're noting here, it's not actually something that can be described in words. It's like "shape-shifting" - it's not something you do because it is the movement of your entire self, rather it is an act of "becoming" a new state. That's why instead we use a cheat. In Chekhov's case, the cheat is that we imagine-that there is such a thing as the imaginary body, and then this implies-that doing something with it will lead to a result. What this actually does, is shift our focus away from intending the movement, to intending the feeling-image which then implies the movement. We've dodged the question of how to intend the movement, and distracted ourselves from the issue of how we intend the feeling-image! The generalised version of the cheat is: find something you are already intending, then attach your desired outcome to that. This is how the Two Glasses exercise works. Everyone knows how to intend writing labels and pouring water, so we take that and piggyback another intention onto that.

Not-so-triumphant moments?

Everyone is omnipotent, but that doesn't necessarily mean jumping off a building results in a flying experience, for example. The movie always matches your script - by definition! - but you are not starting with a blank page here. You are in a state and that state is effectively the present draft of this movie script. This current state is the sum of all previous intentions and their logical implications (see handy visualisation). Altering the relative contribution of those patterns or facts is what "intending" is all about. This means that having outcomes which are "unlikely-seeming but plausible" is relatively straightforward, since it amounts to simply overlaying a pattern on the existing landscape. Having outcomes which break your model more, however, requires an amount of "ceasing and releasing" (stopping implying your current state, as with the movement examples above) and intending alternative deeper patterning or formatting. For example, the purpose of the three main metaphors in the sidebar is to provide just such an alternative formatting. If we are looking to come up with a feedback mechanism to inform our approach to change, then the sense of resistance on encounters when asserting that those metaphors are "true", is a good start. Extending this, we can also sense there resistance when we assert other facts as true, be they general or specific.

Should resistance occur, how does one cease resisting? Practicing surrender/faith?

I say: just leave the sensory experience of resistance alone, allow it to be there rather than try to push against it, and instead hold the intention.

so as i see it now, pushing against it is like reasserting it correct? fighting it/not allowing it thereby asserting the underlying truth of its existence? I just dont know, sometimes i feel like the resistance that arises comes out of fear, and i wish i wasnt afraid, but i am, sometimes i think i have been so consumed by fear all my life that is like a fish swimming in water, not knowing its environment, but ultimately needing it to survive.

That's how I see it. So, there is your intention and there is whatever the intention implies. If we resist something, we are implying its existence and also whatever we think that thing means. The only way around it is to "be okay with whatever is happening". Which doesn't mean we can't change things via intention, but intention shifts things "underneath" (or that's one way of saying it); we can't grip onto sensations directly and they are non-causal anyway.

(An intention always involves a complete shift of everything to an extent, since there are no "parts" to a state, and being a whole means things must be coherent and self-consistent, at least as a landscape if not as story.)

Fear: Totally normal. I have been an extraordinarily afraid person, almost afraid of simply existing, in times past. But fear is a sensory experience, and it's actually the squirmy resistance to the sensation that's the bad thing. If we can accept the experience as it is - "be okay with the moment" - then it becomes just an experience (albeit one that might contain useful information about our state or situation). That's where the whole "be the open space" thing comes in very useful, and that idea of "being an ocean rather than a glass of water" - because the ripples of fear are nothing to an ocean. That kinda thing. This loops back around to the "ceasing" again; that's how we are able to allow ourselves to open out.

Q3: are you holding onto your current position so that you can move from it, instead of fully committing to the target position? I suspect so.

One idea which might help, is to conceive of yourself as containing all possible positions simultaneously - it's just that your current position is "brighter" than the rest. Interesting. I've noticed that if I quickly alternate between the actual movement and the imagined one (to see if I can profit from the residual "after-image" of the target), my arm seems more willing to follow its phantom twin, albeit partially. It starts raising, as if pulled by a force field, falling back after a few inches. This "magnetic" sensation has made me remember another freaky "arm moves by itself" exercise. Perhaps, physical explanations aside, the pushing-against-the-wall might be seen as a rough way to set the target intention... The movie always matches your script - by definition! Where are unwanted experiences coming from? Are they just unforeseen side-effects of our wishes coming true?

I think you make a good observation about the pushing-against-the-wall exercise being a rough way of targeting intention - the action implies-that it will happen, plus perhaps that it triggers the ceasing of downward resistance which might have been opposing upward intention. Which segues nicely into your last point: where do unwanted experiences come from?

"Unforeseen side-effects" is probably not a bad way to put it, but we should be careful we don't think of those side-effects as being in any way deliberate or specified or even created as such. The world can perhaps best be thought of as a "dumb patterning system", with each intention being the equivalent of intensifying a particular pattern into prominence such that it is "relatively true". [1] However, the world is also a coherent whole - it always "makes sense" because it is one cloth - and therefore if we make one fact "true" then that logically implies other facts are true, within our specifications. There are different versions of this though, and not all fit into "stories": For example, if you intend "I will have good posture", then that implies your body will shift shape, tension will release and your body will elongate. Logically, all your trousers might now be too short and you'll have to buy a new wardrobe. Meanwhile, if you intend "I will meet Jim next week", then logically that implies you and Jim will be in the same location at some point, which also implies that, at the point of meeting, there will be an apparent plausible history that "explains' that meeting. You are defining more than just the meeting, in other words. Now, these two examples make sense in terms of there being a "story", but the way they come about is not a story-based structure; it is more like an abstract patterning system. I quite like to use the example of moire patterns for this:

[QUOTE]

Moiré pattern

In mathematics, physics, and art, moiré patterns or moiré fringes are large-scale interference patterns that can be produced when a partially opaque ruled pattern with transparent gaps is overlaid on another similar pattern. For the moiré interference pattern to appear, the two patterns must not be completely identical, but rather displaced, rotated, or have slightly different pitch.

DIVERS PREPARING FOR WORK.

The fine lines that make up the sky in this image create moiré patterns when shown at some resolutions for the same reason that photographs of televisions exhibit moiré patterns: the lines are not absolutely level.

A moiré pattern formed by two units of parallel lines, one unit rotated 5° clockwise relative to the other

[END OF QUOTE]

- Say there's something I want, let's call it A. This might be an event I want to happen or a fact I want to change. In any case, something I want to bring into my experience, a particular "pattern" I want to see in the world.
- Meanwhile, we've got the world as it currently is, which we'll call B.
- Now I intend the new pattern, A. By doing so I activate that pattern, in effect overlaying it on the world, B.
- From this I get the overall result, C, as my new world - see this illustration [missing].

Now, there is no sense in which I really chose that final pattern, and there's actually no way I could predict it (because I cannot see the entire all-space all-time pattern of the world at once), so in effect every overall result is an "unintended side-effect" of my intention. However, the intention itself is always guaranteed to be overlaid and appear in experience, so that's where we focus our attention. What's important, then, is that I specify my intentional pattern in such a way as it corresponds properly to what I actually want. If I just intend "owls" then the generalised pattern of owls will be overlaid upon the world without regard to space or time; it's like putting on spectacles with owl-patterns on. If instead I intend "owls on Tuesday in the city centre", then I have localised the intention to a particular part of the world-pattern. Beyond this, it's a matter of course correction as the larger world-pattern arises in the senses, moment by moment, as being becomes being-known.

[1] Here, we can refer back to our earlier notion of all bodily positions existing simultaneously but at different "brightnesses". Similarly, all possible fact-patterns exist eternally. When we intend, we are not creating something (if we can think of it, it must already exist!), rather we are making it a more dominant component of the world-pattern, thereby increasing its contribution to ongoing sensory experience.

So, we need to combine the intending/increasing-of-new-A with some kind of releasing/decreasing-of-current-B, as in the Two Glasses...

Well, I would say that Two Glasses is a level up from this in terms of structuring, since it is a content transformation - you have a defined situation you want to change - but the point about releasing is right, and the underlying notion is the same of course. If you are going to rearrange a rug, it's going to work better if you're not stepping on one corner of it at the time!

One difficulty in terms of thinking about it is that you can't "do" releasing - it's more of a "ceasing to interfere" or a "stopping gripping". Many people aren't even aware that they are gripping onto their sensory experience with narrowed attention. But anyway, it's really intending while surrendering to any shift, "being okay with whatever happens". In general, if you intend something into prominence then the logical implications of that pattern will take care of the contrary pattern. If you intend yourself into holidaying-in-Barcelona then working-hard-in-Arizona will tend to diminish itself logically anyway. In other words, there is no combining to be done really, since it's part of a continuous whole. There's a little bit of "do or do not" to all of this.

POST: Detachment

Really, there is no method or technique really. Detachment is something you don't-do, rather than something you do. It's like not writing graffiti on your walls. You don't need to do anything about not doing it, you just need to not do it. (Except in this case, thinking a lot about graffiti is a sort of graffiti all on it's own.)

So, you simply have to be willing to no longer hold onto yourself - you have to decide to "cease!" and then not go back tinkering with things again. Increased confidence through results can help, obviously, since you come to trust things. Alternatively, coming up with a description of how things work that you can "believe in" - purely so that you feel better about not interfering, not because it will be "how things really are". However - Something to play with, though, is to notice times when your spatial attention has become narrowed in general, and then release your hold on it. For example, when you are reading this text onscreen, perhaps you'll suddenly notice that you have super-focused your spatial attention around it - at which point you "cease"t that, and let your attention open out and become expansive. You don't need to deliberately narrow your attention in order to do something, you need only to intend it; you should leave your attention to move as it wants in response. This can be quite a powerful thing to realise, and can improve your moment by moment life substantially. Narrow attention can be like holding onto an electrical wire - it makes everything "sticky", including thoughts about your desires and actions. It's much easier to surrender to things when you are an "open space".

Why we are not taught this by our parents. I remember being with open attention in the kindergarten. Then everything went nuts. And I certainly see people enjoying their life managing it only with intentions and not control.

Our poor stressed-out parents don't know! Along with society at large, they think that narrowing attention is how you do stuff, and pass that onto us. This isn't helped by the fact that it's not really possible to describe "intending" in language anyway. You end up saying things like "wishing but not doing", which aren't very helpful until you've actually had the experience. It's been quite fun teaching my parents about this stuff, and them being in wonder at how easily they can move, catch stuff, do everyday tasks without effort or strain (quite apart from the more "unusual" aspects).

This open awareness has me asking since I was little kid "What is like thorough the eyes of others" in the meaning how they experience. Is my experience the "ultimate"? I can't help but wonder about this again since I am returning to this open awareness. I wonder how others feel. Especially this pleasure of just having open awareness, does others have it? This pleasure is still weird to me bc it makes me feel less of a person and I ask how other people are experiencing. I am feeling weird with that. I want to see through the eyes of others.

There's only one open awareness - just try and find the edges of it! So, it sort of doesn't make sense to talk of other people's experience of it. A person doesn't experience being open awareness; rather open awareness takes on the experience of being-a-person. That's not to say that you-as-awareness can't have the experience "as if" you were someone else, just as right now you-as-awareness is having the experience "as if" you were /u/Leewo. Surely the open awareness can take on the shape of any experience, since all potential experiences are dissolved within it?

Which leads us to say there is no "ultimate" experience, since there is no hierarchy to experience, no outside structure by which it could be organised. There is only "open awareness" taking on the shape of "this experience" or "that experience".

George do you garner all this just from a scientific stand point? I have come across similar ideas in the bhagavad gita but in a spiritual context. You always amaze me with your more logical ways of looking at things.

It just a difference of language, I guess. In modern times, we have access to streamlined analogies and metaphors that weren't available in the past. Whereas previously this stuff had to be discussed in terms of examples in nature or quite poetic language, now everyone is familiar with more abstract concepts and visualisations, so we can create more focused descriptions which are less likely to be misunderstood. It's only more "scientific" in the sense that we might use the same component patterns in our metaphors; the fundamental nature of direct experience remains the same as in the older traditions.

Is it best to just intend for a desired outcome a certain part of the day and just forget about it the rest of the day? I just use Neville Goddards method every night and try not to think much about the desired state throughout the course of the day. Is this most effective?

I think that's a good approach, having an "intending time" each day, and also some sort of daily releasing exercise you do daily. For the remainder of the day, just carry on with life - except with that extra bit: whenever you happen to notice you are spatially narrowing your attention, "cease" to do so, and when you are aware you're about to do something, do so by "intending" rather than by narrowing. (Ultimately, you want to stay open and spacious, with attentional focus shifting "by itself" within in that, in response to a larger act, rather than manually.)

When you say 'expanding' your attention, do you mean just trying to become hyper-aware, but at the same time, mindfully dismissing the minutia of existing?

More like, opening up the filter. If you were a room, and your attention was like an "intensity of experiencing" value at each co-ordinate in the room, then "expanding your attention" would mean to be more evenly aware by ceasing to forcibly narrow your attention into a small volume of the room. Rather, you'd release your hold on that value, and instead simply intend what you were doing, allowing the attentional distribution to shift by itself as was appropriate. For example, if you decided to look at one corner of the room, you wouldn't "focus your attention onto the corner" - instead you'd "decide-intent" to examine the corner of the room, and your attention would adjust in whatever was the more appropriate way. (Similar to how, when you move your body, you shouldn't manually manipulate the muscles - you should intend your final outcome and let your movements take care of themselves.)

I understand what you are saying in a basic level, but I think I should go and read that zen body movement book you recommended a while back, which is sitting on my bookshelf.

Definitely this is about experimentation, that's how it comes to make sense. Descriptions don't really capture it (largely because thinking is itself subject to the same issues). The Missy Vineyard book and the Peter Ralston one are both worth your time when it comes to the body movement stuff, since they combine clear descriptions with worthwhile exercises. Be interested to hear how you get on.

TriumphantGeorge Compendium - Part 7

POST: another two glasses question? will i be gone from this dimension forever?

[COMMENT]

A1: In theory for what ive understood reading thousands of posts here but mostly posts of /u/TriumphantGeorge which has helped me alot and seems like a good helpful person and very expert, basically with two glasses (i did it 1 week ago and seems working i might post what i did and my results in the future) you dont really change dimension (probably it can also happen if you do it for something really big which would require a huge jump) but you basically create or edit a path in your dimension which will lead to what you wish for, basically you re-written some facts which in given time will lead to the desired situation. The world adjusts the facts by itself and you will see the results come at you sometimes also in a very blatant way. Basically you alter your reality facts for things that are plausible if very unlikely to happen. i quote TG: *"Potentially any change, although this method is going to generally produce results by "plausible if very unlikely" means. In other words, that's a pretty big discontinuous change for this zero-prep approach! Although you'll tend to get results of "some sort" anyway even for "impossible" things."* I think as the page says, its just a Demo excercise which is very helpful, but, i think to totally change the experience of living in a big way you should use the Mirror one or the others listed here, but that is too risky if attempted without experience. /u/TriumphantGeorge maybe can make it clearer for both of us, he is the expert here :-)
Sorry English is not my first language and its kinda late too.
Edit: im using a throwaway account for personal reasons.

[END OF COMMENT]

Yeah, that's about right. If you think about the Two Glasses, what you are doing is: you are asserting that a certain outcome or situation will be true from this point onwards (although evidence may take a while to appear). You are not changing the events that have accumulated so far, and you're not changing the basic "formatting" of your experience - you are exerting your influence without pushing out of your comfort zone. The results might be incredibly unlikely, but they will not "break the rules of reality" as you understand them. Which is why a simple exercise can accomplish so much; there is no resistance to the outcome other than your resistance to getting what you want or your subsequent tinkering. For more out-of-the ordinary outcomes, where the outcome contradicts "things that you know", the target pattern will need to be intensified more in order to make it "true" (and for everything else to shift in alignment with that). This likely involves confronting what you think you are and what the world is, reexamining your assumptions. Basically, everyone just needs to do some experiments for themselves and draw their own conclusions. :-)

It's definitely useful to keep experimental stuff on a separate account - if only because most people's default view is often that if you are exploring something you must necessarily be a believer in it, which isn't true at all. Especially here, where the whole idea is that you take nothing for granted. Always up for suggestions of how to improve things. We've kept it pretty free-form so far - partly because the nature of the topic is that things are "flexible" with no singular correct way - but I can see how, for example, having a flair for posts which are specifically about Two Glasses results or questions might help people better find them.

no one really buys owl related items here but i just realized that i have two little white owls statue on my desk and 3 in another room, weird lol.

Ha, that's a good one. Now you get to ponder: has it always been true that there were "two little white owls" there, or is it only true now that there were "two little white owls" there? (Do it without actually intending to produce memories for them, though; try and just see what is there in your mind already.)

Hence the thought-provoking name, The Owls Of Eternity ;-)

Q1: Haha yea well my suggestion would be to have flairs (images or words) for threads and for nicknames, so, who is new can use the flair Beginner or Yet to try and who has already done lots of expetiments or jumps can use the Expert Jumper one, also, maybe flairs with Mirror, Two Glasses, ImgRoom etc so you can put as flair which method you used. And yea also for posts so they are easier to identify when searching :) (it could also be a two cup or mirror icon image) For the owl thing yea its crazy i swear i know what owls are but they are extremely rare where i live and for the last 20+ years ive only seen or really noticed around 3 or 6 and a few on tv or internet. Its not mainstream here... Now when i noticed i had two white ones on my desk i couldnt believe it because i remember it as just two white snowmen in a christmas contest near a christmas tree... Now i got two white owls with christmas red green hat and scarf which really makes no sense to me that a xmas related item would be snowmen in an owls shape next to a tree, lol. Its fun, indeed, and got me question as you said if they were really owls or snowmen. Btw the flair one is just a suggestion to make things clearer, its ok if you guys want the page to be as simple as possible ;)

I'm thinking we probably don't want to frame "jumping" as a sort of skill set that you become better at, since it's really about ongoing exploration, discovery and creativity. It's not really something you achieve (you actually can't get better at it, in a way, you just become more confident). Plus, it's more important that we come to understand how things are, rather than get results (although the two are sort of mixed in). But I do quite like the idea of a simple labelling for posts about a specific exercise. Thanks for the input, I shall mull it over! :-)

Yeah, having owls with christmas hats and scarves next to a tree does seem a bit... unlikely, doesn't it? :-)

honestly the mirror method seems a little like self hypnosis. EX: In order for some people to stop smoking some people try hypnosis to have certain thoughts put in their pysche (like cigarettes are gross and whatnot) to achieve the goal of actually quitting smoking.

I suppose that, if you were to discover that your "self" was in fact basically "the world", then all so-called "reality shifts" could be described as a form of "self"-hypnosis - i.e. lowering resistance to change and then modifying patterns via intention. The difference would be that you would now realise and accept that "experiences are apparently local but intentions are actively global", and your intentions would likely increase in ambition and commitment accordingly.

POST: Butterfly effect

Just as a pedantic point, I'd probably not call this the "butterfly effect", since that implies that there is a sort of "causal ripple" or chain of events that arise from an intention. That can be a misleading image, because an intention isn't an act which sets off a series of happenings. It's an instantaneous shift in the "world-pattern", out of time. With that out of the way...

It's not necessarily true that an intention necessarily leads to further obstacles - but it is true that making any change inevitably implies other changes. Using the oft-invoked metaphor of the "blanket of material": if we think of our world as a single continuous pattern on a piece of material, then adjusting the shape of a fold in that blanket will by its nature mean that you will be tugging on the material and therefore reshaping other folds. This simply follows from the continuous nature of the material, which is a metaphorical way of saying that the world must always "make sense" as a whole between intentions. (Again, the reason I don't like to call this the "butterfly effect" is because the whole world shifts instantly, like a rebalancing; there is no ripple effect involved, in time)

Now, although these "collateral shifts" might be caused by the intention in the sense that you moved the material, they are not necessarily logically connected to the intention in terms of "objects in the world". For example, you intend to have success in a business meeting, and an extra tin of peaches appears in your parent's kitchen cupboard. Furthermore, even the collateral shifts that are logically implied by your intention aren't directly caused by it as such - it's more like an "autocomplete" based on existing patterning or plausibility. For instance, your success at the meeting logically implies that the other party in the meeting was less successful, which implies that he is less well prepared, which implies that something distracted him from his preparations. Even though you intended success the morning of the meeting, it will become true now that he stayed late at a party with his wife last night and so he didn't prepare - or whatever. So, I suppose that's a long way of saying that change always implies change! The world is a single pattern, so altering the contribution of one pattern always shifts the pattern as a whole, self-consistently. To expand on another point sometimes made: you are not generally "shifting all the time", inherently anyway I'd say, but any deliberate intention you do is a rebalancing, no matter how insignificant. With something like

"dimensional jumping", we are choosing to make a larger shift than we would normally do - simply because we recognise that there never were any baked in barriers to the world, and we are comfortable enough to stop re-asserting those barriers. We are, like, making a year's worth or a decade's worth of changes in one shift. Inevitably, then, what would otherwise be minor collateral changes occurring over a long time, now occur in a shorter space of time. This can feel dramatic. You could end up having to "grow up fast" as your circumstances suddenly shift, without the usual acclimatisation period. This is not a reason not to do it, but it is a reason to choose your outcomes carefully. An extra thought is, you can always incorporate the intention that things will turn out for the best, more broadly. However, you cannot intend against the discomfort of change, since that is to intend against change itself.

==I get it now.

But what about having intended to connect with a person and that said person having sprinkled leg the next day? In that line of thoughts this person could lose his leg the next time I intend. (just to make the point) And it's as likely as not given the concept of rebalancing. What about when rebalancing is done the change affecting something/someone negatively, logically related or not to the intention? Is it all "it wouldn't happen if it wasn't to happen anyways in time"==

I guess what you need to do to deal with this, is come up with a model of responsibility that satisfies you. I'll outline one below that you might use, though: The implication of this "blanket" metaphor is that the whole world-pattern is dissolved within you. It is in effect your own "private copy" of the world, fully defined as space and time pattern, but all available all-at-once. However, that doesn't mean that you "know" the current state of the world. I'd suggest that you can only take responsibility for what you know, and what you intend deliberately. It is meaningless to draw causal connections between intentions and subsequent experiential content that was not the content of that intention. Those experiences may have already been there and been unaffected, or been improved. If the (hypothetical) link is outside of your sensory experience, if it cannot be experienced in advance, it is "does not compute" to speculate on it. You would be worrying about an idea about causality - and being skeptical of "ideas about" things is one of the main foundation of this approach. If you intend to connect with someone and you meet in the street because they sprained their ankle and had to stop to rest - well, you could hypothesise that maybe it was already "patterned" that they sprained their ankle, and what changed is you went down that street. Or the sprain changed date and location. But you would just be making up stories, since there is effectively no longer any "how it was before". Something to consider too, is: There is effectively no "how things are" until you've experienced them in the senses. And strictly speaking, the only definite "how things are" is the content of your sensory experience right now. Before you intended to meet that person, subsequently encountering them with their sprained ankle on the street, perhaps they had actually been patterned as "died in a car crash five years ago"...

How come they could have been patterned as "died in a car crash rs ago" given the concept "how things are" (your sensory experience right and only every now) when I saw them the previous day and every other day. It is mind blowing what I've got from your post.

Well, for the sake of the example, I was actually assuming that the person was someone you hadn't seen for years! Basically, I'm saying that you just have no idea of how things might be patterned before you intend or before you encounter facts relating to them in the senses, and how dramatic the shift might have been in a good way.

Ok got it. Till the next time I don't understand something. I feel a little bit foolish. Thanks. Does this thing works for depressed mood (currently nofap but just came off depression). And is it okay to use the two glasses method as often you want for different purposes? Like one day one thing and the next other. (Or two times a day) What would be more direct way and with the same efficiency? Dammit it's hitting me bad.

Well, I could have been clearer!

I was trying to emphasise that while things are still unobserved, you have no idea what the implied patterning might be for those things. The extent of a shift could mean a shift from an upcoming "reading in the paper tomorrow that your friend Bob died five years ago" to an upcoming "grabbing a coffee tomorrow and bumping into your friend Bob". (Meanwhile, there is a side discussion to be had about the extent to which having observed something means it is "fixed fact" from then on. It is not, necessarily, but that "fact" does become a strong contributor to subsequent experiences, so re-patterning it would involve quite a rebalancing. However: Mandela Effect or Glitch reports about someone you thought was dead years ago, still being around, etc.)

Every Two Glasses session is a fresh session. So, you can do it for one situation. Then, another time, do it for another situation. Every time you do it, you are connecting different states to the glasses and water, and performing a different shift. Doing it for mood is actually a good experiment to do, but: decide in advance that you won't oppose or fiddle with any mood shifts that happen. (Another experiment: just sit quietly for a moment, and then "intend" to "feel really happy" - and see what happens.)

I fell into deep meditating state. All is good now. Immediate changes were my internet connection dying since I wrote the previous comment and having no more flatline (nofap). I guess that's what we call a jump.

That's an interesting combination, for sure!

More weird was what followed (see Derealization if you haven't).

Just glanced over at it. If you are still feeling a disconnect, maybe try directing your attention towards your lower abdomen - not focusing on it so much as including it in your "presence" or "sphere of awareness" or attention. Then, gradually include other parts of your body space. You may have ended up being "over here" while the rest of your sensation are "over there"; this would dim everything down and make you feel kind of remote. There's a difference between everything being dreamlike (which it is), with feeling separate from it (which you are not). Generally, relaxing into the dreamlike feeling is a release of attention, an opening out, and feels present, good and "alive". Don't be afraid of just "intending" that sort of thing, just as you did with the mood, after deciding how you want things to be. You can tinker with it until you get something you like.

POST: WARNING - Please heed - Horrible result from mirror jump - family member suicide due to demonic possession

It's always hard to deal with the loss of a family member. That's never an easy thing to go through, and it's inevitable that we will go looking for reasons and answers afterwards. However...

There are no "evil demonic spirits", and people should be wary of obsessing about whether they "caused" something bad to happen when the connection is very vague like this (generally speaking anyway, and definitely in this case). If you didn't explicitly intend for something to happen, then any connection you make between your action and subsequent events is pretty much just story-making. It pains me to say it, but for a change this may actually be confirmation bias!

So, your post should serve as a warning - not about exploring the topic, but about being specific with intention and being quite ruthless when drawing connective lines between experiments and outcomes.

On Believing in Things

If you believe in things - by which I mean, if you fully adopt the conceptual framework or pattern of a particular worldview - then you are certain to have experiences "as if" they are true. This applies to spirits, souls, dimensional jumping, alternative realities, alien beings, norse gods and... just being a person hanging out on planet Earth leading a boring life. None of these things, including mundane life, are fundamentally true as context; they are relatively true as content. Note, I am not saying that those experiences are psychological or that they are "not real". Rather, I am saying that the only thing that is consistently real is the fact that you are having an experience (that you are a "consciousness"), but actual the content of the particular experience depends on what ideas you have absorbed. In other words: all experiences happen on an "as if something is true" basis only. Dimensional Jumping depends upon this. It is the fact that if we strongly adopt a specific intentional pattern, we can have experiences consistent with that pattern. (And that, by implication, our everyday world is noting more substantial than a pattern which we happen to have adopted and accepted unwittingly.)

So there are no alternate realities as such; there are just discontinuities in our experience "as if" we had switched reality. There are no "evil demonic spirits" , but we can have experiences "as if" there are such things. You can test this for yourself, by selecting an arbitrary pattern and then fully committing to it. For example, deeply decide to pretend that the weather is controlled by spirits who listen to your mood and adjust the sky accordingly. (Seriously.)

On Intention & Responsibility

I'll keep this one quick, because it has been expanded upon in the links below. The summary:

- If you did not intend something specifically, then you are not responsible for it.
- Responsibility is dependent on knowledge. The only knowledge you have is of the content of your specific intention.
- Responsibility for things outside of that intention, would require knowledge of what was going to happen before that intention, knowledge that it changed after that intention, and that it was your intention that specifically caused the change.
- None of these apply in your case. You didn't even intend anything! You just had a spooky experience!

Basically, I think you are probably just suffering from a mixture of fear and guilt - perhaps exacerbated by a religious upbringing - and are attaching meanings to events accordingly. Perhaps you associate exploring these areas as "bad" or "forbidden"?

Most problematically, you are mixing differing worldviews. The worldview that leads to "dimensional jumping" is by definition one that does not include "evil demonic spirits" as beings with independent agency!

In summary, then:

- You are not responsible for the events that occurred. (For starters you didn't do anything that would lead to change, and if you had you still wouldn't have "caused" the outcome since it wasn't specified).
- You do not need to worry about evil spirits and so on. (Well, unless you really like worrying about them, of course. That's up to you.)

Related Links: You might find the conversation over at The Butterfly Effect post worth a look too, for this. See also: the Kirby Surprise interview about synchronicity that is linked in the introductory sticky, for quite good examples on the "as if" thing.

I suspect this is what lies at the heart of why things like servitors or tulpas work. If I convince myself that entity X causes Y to happen, then I just need to continuously assert that entity X exists for Y to happen seemingly naturally, right?

It's at the heart of how anything works, really, but those are definitely good examples. It's all about your intention and the implications of your intention - where I'd define intention as "thinking the fact of something being true or existing" or "increasing the relative intensity or contribution of a pre-existing pattern". (I say "pre-existing" because you should consider all possible facts or patterns to be eternally present and always contributing to your ongoing experience; what changes is their relative 'brightness'.)

POST: Owls say go for it but everything else says to give up.

I think you are kind of mixing up models here: that of direct patterning (the owls) and "messages from the universe" (your interpretation of the numbers). The fact is, the more you imprint yourself with 555 and 999, the more those numbers will appear in your experience, regardless of any meaning - just like the owls. So our thinking then goes to: how can we pattern the experience of "getting together with someone", using the same principles that are behind the owls? In general, I wouldn't worry about "the universe" and what it has to say, except as a reading of your own previous intentions. Which isn't to say that you can't structure yourself such that you experience "having insight via symbols" if that's what you like, but it seems a very roundabout way of handling something you can likely do more directly.

POST: Can I use the two glasses method to get a girlfriend?

If there's someone you like, ask them out. If there isn't, just start keeping an eye out. A sip of water in the meantime will, at the very least, keep you hydrated in preparation for the fun ahead. And if you're doing that anyway, putting a couple of labels on the glasses isn't much bother. ;-)

you'll get a girlfriend but end up in a universe in which you also die of cholera

Um, that does seem a little bit extreme! :-p

I was exaggerating...

...your monkey doesn't just have paws, it has talons laced with teen-specific biocide!

Are you saying I am a teen? Well, thank you very much for that compliment. Haven't heard that in over 40 years. Anyway, I wasn't being mean, I could have used anything else as an example but many people here on reddit don't get subtlety. So I thought, go and say something easy to understand. How is this being taken the wrong way? [Seriously].

On my end, I was just entertained by your example of a "monkey paw" effect being so extreme, promoting mental imagery of a particularly savage occult revenge monkey - the "teen-specific biocide" was because our OP is only 17. Although I'm sure you are young at heart too. ;-)

I think others may have misread your response as being dismissive, though, just because without a smiley to denote that it is well-meaning, the interpretation of it is vulnerable to whatever mood the reader happens to be in when they encounter it.

POST: Half a year ago, I jumped. Here is my final update.

It's a shame the header is the same number, but I believe that it should be a longer number (6+ digits) so that smaller jumps could be noted as well, and not just planet-changing ones. Maybe I'll make a website with a long dimension number for dimension jumpers to use

It would really make no difference, because: a) dimensions are not literal of course, but also: b) if there are an infinite number of states, then there are an infinite number of different states with the same number, no matter how long that number is. This is why the sidebar emphasises that the header number should be views as "an emblem of change and a symbol of potential rather than an ID".

The longer the number, the more likely it is that during the creation of the website, a different number was generated, hence, it would allow one to detect more minute changes.

I don't see the logic in that. You'd have to lay out why, exactly, it would be more "likely". The creation of a website is a static event - it is true now that the result will be this - within a particular state. The creation does not "happen" in time. There are an infinite number of states which have that same result. Furthermore, there is no necessary link between the number and the rest of the state. Literally every other part of the state could be different, and yet the number could be identical - even if that number was infinite. This is because the number is not a hash, or summary, of the state; it is merely another pattern of fact within it.

There is no indication that the header number on this subreddit will change either, but if it does - it will be irrefutable proof for the individual that they did jump. The number will be randomly generated and parsed through multiple more time randomly, which should, in theory, give a different result in each dimension since even small changes result in random number generators having different outcomes.

Indeed: a change of state doesn't necessarily give rise to a change in number, but if a change in number were observed then for the observer that would be proof of a change (whether in the world or in their memory of the world). Again, though, given the background concept of a shift, it just doesn't necessarily matter whether the number is randomly generated, multiply parsed, and so on. None of that actually "happens" as such, in this model. The number as it is, was - in narrative terms - already randomly generated by the entirety of all history, but really the moment, now.

We seem to have different ideas of how dimension jumping happens. In my interpretation, you are switching places with yourself from an alternative timeline as such, their past might have difference to your past. Hence, if the past was different, the outcome of the random number might be different and that would eventually change the number displayed on the website.

So - that's not the concept, really, as I see it. There is no "other you" and there is no past as such; there is just an ongoing now-state which has a patterned personal memory. If you update a fact in this now-state, the whole state will shift coherently, but it is not the same as going back in time to make a change or there being a parallel timeline that you are jumping to. There are no timelines, other than as a narrative fiction to help construct or describe intentions; "dimensions" fall into the same category. If I modify my current state, then, there is no reason why the number should change unless it is entangled with the fact I am modifying. Not entangled in terms of a history, note, but in terms of a logically coherent world at this moment. For example, being silly for a moment, if I shifted my state to one where the number "9" was written differently, then the number would have to change visually to be consistent (although: I could also subsequently encounter a plausible story about it being a stylised choice, or an error, which "explains it"). So it doesn't actually matter what the supposed mechanism by which the number is generated is; that process never actually "happens" anyway - the mechanism doesn't really generate the number in the way we normally assume - and if you make a change to your state it definitely doesn't "happen" again as some sort of replay. Your state could change such that the evidence, now, for your past is completely different, and still the number could be the same - especially if it is an supposedly random number (because then it has no logical link to the rest of the state at all). What we need, then, is something which absolutely dependent on the rest of the state, that must be different whenever the state is different. The only thing that fits the bill is your own global sense of state - your felt-sense. Other than that, the way to know whether you've "jumped" is by observing that the experience you have intended, has now become your experience!

That's an interesting explanation! I was basing this idea off the fact that many people reported seeing slight alterations in history when they jumped, so I thought that those changes tend to have a Butterfly effect on the rest of history - inevitably leading to different outcomes for random situations. Since, dimension jumping is still an unexplored concept, I will follow through with the website idea. Who knows? Maybe there is only an ongoing state of things, or maybe there is a parallel timelines in the sense I intended. Thank you for your input, it is much appreciated!

Yes, as I see it: "alterations in history" in the sense of the past changing is an interpretation. What is actually observed, is a discrepancy between what you see now and what you remember, also now. Once a fact has been changed, then all subsequent experiences will be in alignment with that fact "as if" it were always the case - the world always "makes sense". However, the world did not get "replayed" from some historical point. The entire pattern of the world is always now. There some additional factors that come into play to do with how we conceive of events, but the essential idea is: you can't rely on the replay of a process in your test, because the world merely has to be self-consistent as a pattern; it doesn't have to actually unfold in time. Anyway, yeah: don't let me discourage you from playing with stuff, because if nothing else it encourages us to think things through. However, I would point out that one of they key underlying ideas in this subreddit is that there is a difference between thoughts about experience - "parallel constructions in thought" - and the experience as-it-is. Have you ever observed a "timeline"? Or is it a diagrammatic convenience that exists only in thought? This is a general point about the reification of abstractions, and it is worth considering no matter what your overall position on this. This even includes ideas such as the world apparently being a "spatially-extended place unfolding in time". That's why the sidebar has a section on "Active Metaphors".

Thank you for providing me with an interesting read, I will definitely think about this. All dimensional jumps are really hard to have experiments conducted on, as they are not falsifiable. I hope to merely bring another possible anchor point on which people can maybe build more concrete data as regards to "jumping". Your replies have been very enlightening, thank you.

Basically, ideas like "falsifiability" are pretty much meaningless here, since you are no longer modelling things using the "objective world" container concept. Even our usual description of ourselves as "a person in a world of objects" no longer applies; we have to shift to a direct observation perspective, and reconsider the "nature of experiencing" itself. All of which is, of course, why this is such an interesting avenue to explore! The "results" are actually secondary, in the end; that's just the hook really. Thanks for the enjoyable discussion! (And if you like that article, you may also find this Quanta article [<https://www.quantamagazine.org/quantum-bayesianism-explained-by-its-founder-20150604/>] and this Nature article of interest [<https://www.nature.com/articles/507421a>].)

So, I mean, are you just essentially going back to the Bill Hicks 'joke?': Today a young man on acid realized that all matter is merely energy condensed to a slow vibration, that we are all one consciousness experiencing itself subjectively, there is no such thing as death, life is only a dream, and we are the imagination of ourselves. Myself, I'm getting to the stage where I'm becoming more...adept at jumping and jumping into realities where life is substantially different to the 'human' experience. Jumping itself is easier, jumping into a substantially different 'reality' is more difficult although I feel like I'm getting to that point rather quickly. Anyway, thanks for clarifying. :)

Well, maybe. I do like the phrase "we are the imagination of ourselves", though; that nicely captures it, eh. It avoids any "stuff" or labels but gets to the essence of the experience. There's no perfect description though. I quite like:

- "What you truly are is 'awareness', whose only intrinsic property is being-aware, and which 'takes on the shape of' states or experiences, such as the experience of being-a-world-from-the-perspective-of-a-person".

However, I just can't get it to work in my stand-up routine, for some reason. :-)

George... during our chat today I mentioned the same Bill Hicks quote. Although, I have a feeling that isn't the first or last time it's been quoted here lol.

It does seem to have been "quote of the day", today!

POST: An experiment with the two glasses method

Well, the whole thing is an exploration of "the nature of experiencing", so treat it like an investigation, I'd say, and feel free to try anything. Having said that, 2G is not designed to be "world-breaking" so much as "world-shifting" - it typically involves results that fall within "plausibility" even if situationally completely improbable. So I would generally start with things like outcomes you want to happen in life, introducing patterns into your ongoing experience, stuff like that, and do this repeatedly until the idea of it being a coincidence become ridiculous. Then you can push it further, and contemplate what it means. Until then, lacking a sense of why the exercise is designed the way it is and how the results come about, efforts to "prove the validity of the methods" can sometimes miss the point. Even the phrases "validity of the methods", "strengthen one's belief" and "strengthen the ritual" are somewhat loaded with assumptions - assumptions which might turn out to be incorrect upon further examination. Think: what are you testing, exactly?

Q1: The way you explain things is the master of craft i would love to experience. Phenomenal work TG, and may i ask: " do this repeatedly until the idea of it being a coincidence become ridiculous." So just keep repeating the same thing day-by-day even if it fails? How does feeling intake into these assumptions/experiences?

I guess I mean, that if you keep deliberately intending for results (using your narrative of choice), and you keep getting them, then over time "it's a coincidence" or "it's confirmation bias" will not be tenable. In other words, you don't have to force a "rule-breaking" experience in order to be convinced; simply continually getting what you ask for can be sufficient. Although in fact, the manner by which outcomes come about will tend to become more outlandish, the more you continue. But only you can do this, personally, by intending; nobody can demonstrate this for you. Of course, if you don't get any results at all, ever, then you can feel free to dismiss the whole idea that there is anything unusual going on also. Not sure what you're asking, regarding feeling. Care to expand?

Q1: I completely agree as i've have experienced this to a certain extent, beginning with average cars such as a corolla S 2016, to a Maserati. Now speaking about the feeling, in the sense towards manifestation itself. You know acquiring ownership of the coincidence that often manages to follow you as you proceed with the intentions. Since this matrix is all mental based on feelings as some would say. So instead from seeing it day-to-day basis where ever you go, To having it, being able to use it, etc.

Hmm, so I'm not sure I'd agree that what we're dealing with here is "all mental based on feelings". Feelings are certainly things that can arise as aspects of our ongoing experience, parts of the pattern, and there can be a general felt-sense that is like a summary of our current state - but regardless of whether we feel like we are the world, or feel like we are a little person, we always are the entire thing. Meanwhile, I'd say we have to be careful of the desire to want feel ourselves "doing" things: intention is not a "doing" and has no particular experience associated with it. To focus on wanting to, for example, "feel powerful like a God", can be more of an impediment than anything else. Better to simply recognise the true situation, and from that recognition will flow experiences which support it. Having said that, spending a moment to assert that you are "the space in which, and as which, sensory experiences arise" can give you that sense of a shift in your perspective, placing the world and the person you apparently are in proper context. The experience is sort of like waking up and realising everything is inside you (and that there is no outside to it). Maybe that's a way forward?

POST: Is it possible to jump and change things for another person? If so, please help me.

Forget the idea of gurus or prodigies, it's all down to your own experimentation, but I can think of a few things:

- Try the "boundary" exercise described in this post [POST: Jumping for remission of mental illnesses] (you may find some of the other exercises in that thread useful too);
- Try reframing your experience as you being an open space in which sensations arise (this changes your sense of self relative to others);
- Experiment with "asserting" that the space you occupy is friendly and polite, by reaching out and filling the space around you with that "atmosphere".

Most importantly, though, you have to cease preparing for or defending against impoliteness, because doing that implies the fact. For as long as you keep doing that, you will continue to maintain that patterning in your experience in one way or another, I suggest.

A1: you can start by deciding you are not a victim. There is no inherent "negativity" of others. There are only other people talking or taking actions, with or without the intent of manipulating you emotionally. It then is your choice as to how you view and react to their blah-blah. You are currently choosing to view them as "being negative" and then "getting you down". Imagine if you were viewing them on TV doing their blah-blah. Would you make the same choices based on what you saw? So choose otherwise. Stop with this "impervious to negativity". Negativity is not a "thing". It is a decision in your mind.

POST: It worked in ways I couldn't imagine.

Dimensions aren't "places". You are assuming that the world is a "simple, single, shared, spatially-extended place unfolding in time" and that people must "go somewhere", but this isn't necessarily true. Keeping it simpler, though:

can see the post from your previous, "unhappy" universe (the one where you wrote that you are going to jump), which shouldn't exist in your "happy" universe.

However, there can quite easily be a "universe" where she posted an unhappy post, and then things magically turned around. The truth is, that the concept of a "universe" is just that: a useful idea. It implies there are a set of "places" with an unchanging fact set, and this story jars against that, but it is just a concept. In your actual experience what happens is that the content of your experience shifts. You never really experience going anywhere; that's just a description that is sometimes useful to help us conceive of change or grasp experiences. Anything that you think about experience that involves an unobserved "outside" aspect is immediately "wrong", just useful narratives. This includes "dimensions", "universes", even "objective worlds" or any other version of an "external environment" idea. So, to argue about whether someone's changes are because they "jumped dimensions" or something else, is really an argument about categorisation rather than about what "really happened". What really happened was: the content of their experience shifted.

Q1: What really happened was: the content of their experience shifted. But if your concept is right, there is no "their" experience, because they are just a part of my experience. And in my experience, you say, literally anything can happen, breaking any laws of physics and common sense. I could end their existence by shifting my experience, shift it so that they never existed. Would it end their first-person experience too? The world isn't shared at all, it seems. That's a cool concept of course, but i'm not getting lucky with any of the techniques. Even with the owls.

Indeed. Although to pick up on a couple of points:

- You can't end "their" experience because, as you note, it is "your" experience, which in turn means there is just "experience" really, with no ownership, only experiencing. The Hall of Records metaphor tries to provide a simple way to think about that sort of thing, but of course in truth it is literally unthinkable. Conceptual thought is "too late" when it comes to trying to grasp the nature of experience. You can't think of what is "before" division and multiplicity and change (= objects relating to one another in a mental space), because thought is already chopped up into objects. Thoughts never get "behind" experiences; they are themselves just experiences.
- The "laws of physics" and "common sense" aren't rules in the sense of being a solid independent structured substrate upon which events occur. Rather, they are the "codification of [a subset of] experiences to date". (The "subset" part is because what gets included is already pre-selected by a conceptual framework, particularly the "container concept" of an "objective world", which relatively recent). So, we must remind ourselves that: the observations restrict the possible valid models, the models don't restrict the possible valid observations.

But yeah, all of that is fair enough and fascinating to ponder, and it can help you somewhat grasp the nature things as it is, but to really know it you'd want to actually produce experiences on an "as if" basis that goes beyond your usual assumptions. So, the owls should be a nice easy entry point. There are some things which might get in the way of making any changes, though. For example, something to check for yourself: When you go about your day, do you tend to "grip onto" your attentional focus? Or do you tend to assert your current bodily position and current experience? Are you "in control" from moment to moment, moving your body deliberately and with focus? As opposed to, "directing" yourself to do something and then allowing your body, thoughts and attentional focus to move "by themselves" towards your goal. As you read these words on this screen right now, is your spatial attention narrowed down onto them? Are you "using your eyes" to see this paragraph? Or are you "open and spacious" and allowing the world to "come to you" instead?

The reason for asking that is that continually intending everything, never releasing experience to just flow, can essentially amount to a constant re-assertion of your previous or habitual state, in opposition to other intended changes. This is why we say that doing the exercises should require no effort and no particular sense of intense focus or doing (because it "fixes" you in place).

Q1: This is why we say that doing the exercises should require no effort and no particular sense of intense focus or doing (because it "fixes" you in place). Sounds like having concentration problems and bad memory would help, lol. How should one achieve the state of being "open and spacious" if concentrating on it would be an obvious mistake? I'm doing blank mind meditation every day for about a half an hour. Doesn't seem to help.

Ha, yes, people with poor memories might be getting everything they ever intend always, effortlessly, but ironically they never get to appreciate it. :-)

Alright, I'm now going to type out whatever occurs to me on this topic - So, it's not about having a blank mind or whatever. Rather, it's about reshaping your experience so that it is formatted with a different perspective, and you then don't narrow again. A key thing to realise is:

- Events are apparently local; intentions are actively global.

Which is to say, that although (for example) when you move your hand, the sensation of that occurring seems to be localised spatially, the intention or "wish" that triggers that experience is not localised - it is "unlocated" and "unbounded". It is a shift in the subject, not of an object. This is why you don't need to concentrate your spatial attention on your hand in order to move it, and if you do then you are intending something additional (narrowed attention and tension) rather than doing something causal. This can be visualised as overlaying a pattern of intention upon the current pattern of experience - like moire fringes. The intentional pattern has no boundary, it is equally everywhere, however it's combination with the current pattern results in a localised experience. Now, how does this apply to being "open and spacious"? In two ways:

- To become "open and spacious" one simply decides to be open and spacious.
- Having become "open and spacious" one now allows one's sensory experience to simply unfold unobstructed, without narrowing down or gripping it, having realised that intending does not require focus or indeed any "doing".

The phrases which may help describe this formatting of experience are:

- What you truly are is an awareness, a non-material "material" whose only inherent property is being-aware, and which "takes on the shape of" experiences. Or:
- You are an open mind-space within which your ongoing experience spontaneously unfolds. Your main strand of experience of "being a person in a world" can be conceived of as a particularly bright, stable, 3D-immersive, multi-sensory thought.

Finally, a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the facts of your experience - the only actual facts, really; everything else is transitory. It also lets us realise why narrowing down or forcing change tends to backfire, because it is a restrictive deformation of your current experience, which obstructs other intentions. In short, you want to cease interfering and adopt the stance of being rather than doing-controlling, at which point your intentions are minimally obstructed. Otherwise you are effectively intending two things at once: you are intending your current situation and your target situation simultaneously, like trying to get up out of a chair by focusing on "being sat down" while intending to shift to "being stood up"! (Lots of people do exactly this. It is a worthwhile exercise to experiment with standing up effortlessly without "doing" it. The same principles apply to both the mundane and the exotic.)

Q1: In a stupid simple takeaway from this, isn't this why a "assume the wish fulfilled" is a helpful technique? Effectively replacing your reality that way you aren't forcing anything anymore?

Yes, although I think that phrasing can sometimes leave people with no way into it (depending on their background). So equivalently we might say that we would "think the fact of something being true", where that "thinking" involves attending to an unbounded, unlocated, non-object thought. An intention, basically, which is: the pattern that you wish to make more prominent in your ongoing experience. When engaging in that, there is no experience associated with it as such (unless the intentional pattern has implications for your sensory experience right now), because there is no object present only a "dissolved pattern" being increased in its intensity, however there is a knowing that you are intending.

do you mean more discontinuous, less plausible intentions?

It was more to do with the spatial and temporal "co-ordinates" of the target outcome vs your current experience. I mean that you never actually experience "intending", you only ever experience the "results" - as in, the resultant content of your state. So if you intend something that doesn't affect this current sensory moment, then there's no reason why you should experience anything while doing it, other than "knowing" that you are intending. If you intend an outcome that takes place tomorrow, or a fact that only affects a situation in Sweden while you are in Toronto, there's no "result" for you to experience right now, even though your state has shifted. (Note: you might sense a "shift" but that's not necessarily the case.)

Q2: /u/triumphantgeorge now this just occurred to me: since i've been looking for anyone who could possibly understand me to meet, and any scenario i choose can be experienced - then couldn't i meet you? i imagine it would be like the "(you) speaking as i'm thinking" verse i saw in the caitanya bhagavatam. and if i wanted you to do something - wouldn't you?

It's an interesting idea. However, if you have already "patterned" me as a quite independent, purposeful character in your experience, then it might not be so simple as simply "wanting", because my "definition" might be contrary to that. You might have to change me first. As in dreams, you'd probably be better intending a new, fit for purpose character, rather than adjusting an ingrained existing one in an attempt to make it responsive.

Q2: As in dreams, you'd probably be better intending a new, fit for purpose character, rather than adjusting an ingrained existing one in an attempt to make it responsive. but ultimately it would only be my decision, wouldn't it. as with everyone in the entire cosmos - only i decide everyone's fate and behaviour...

...and your new decision is added to the accumulation of all your decisions to date, as an amendment to your present state.

so there are no "fixed" characters

No fixed anything, only things that you keep intending or implying. The "implying" part is the tricky one, because sometimes it is implied by a more abstract pattern than an individual fact, perhaps. For example, intending a movement implies a location implies a coherent continuous space, and so on. Whole world dynamics may be associated with a particular fact or outcome, therefore. So one might need to keep in mind the "granularity" one is dealing with - attend to a more global fact, in order to better tackling minor or local facts subsequently. (The only thing that is permanent and fundamentally true is the fact of "awareness".)

/u/triumphantgeorge so couldn't i just make you appear somewhere at my choosing?

I don't see why not. But then, what I see or not doesn't really matter. Can you see a "why not"?

the only impediments I see are recognising your form and the 'story' by which i see you

...within you.

...

AI: I don't care if I jumped or if it's all coincidence. My life is better and I'm happier. Your skepticism is real downer though.

POST: Changing the past?

What you are really after, is to shift your ongoing experience such that it behaves "as if" the past were different. Neville Goddard has a nice discussion on that in one of his essays - see the links in the relevant post, perhaps.

POST: Get off your ass and do something about it.

However - if the purpose of the exercise is ultimately to conduct an experiment, to give yourself an experience that provides an insight into "the nature of ongoing experience", then your post is missing the point. Putting that aside though, if we were staying focused on outcomes it would probably help if you describe how, exactly a person goes about "making it work out". You can encourage people to "do things", but you have to say what exact things people should "do". Meanwhile, any description like that has a set of hidden assumptions, an underlying philosophy. Since in the end that's the deeper purpose of this subreddit - to reveal hidden assumptions, and use that knowledge - then laying this out would be helpful. Like, your theory of why "fate is more likely determined" by what you choose to do other than "2 fucking glasses". What if you choose to do two glasses?

Otherwise you're literally and unhelpfully saying: "hey, don't do that thing, instead do... um... y'know... something else".

What a person should do obviously depends on the situation he is in? I'm just saying take an active step to ameliorate your predicament.

Of course! But the difficulty can often be in knowing what that active step should be. You need the world to "move" and a path to open up. Just "doing stuff" often doesn't produce that; it just produces "being busy" without any accomplishment. In fact, your own behaviour is also part of the result of performing the experiment. The reason the final instruction in the exercise is to "carry on with your life" is because the overall movement towards a goal also includes your own bodily and mental movements. It doesn't say "now sit and wait for the championship trophy to be delivered by FedEx".

Example: Perhaps what might happen is, the day after the exercise you would feel the urge to call a friend, and in your conversation he might mention he just met a great coach that was doing free sessions, and you would find yourself feeling enthusiastic about that so you'd go along, and the new coach has a special method he uses which lets you master certain moves really quickly, so by the time the tournament comes around you are totally ready in that particular area, and then in the tournament the moves that come up happen to be the exact ones you've just mastered in such a short time - the trophy is yours. You get the idea. Although in practice it can be both more or less "logical" than that, more or less pushing against the boundaries of apparent likelihood, depending. Ultimately, the whole thing is recognised to be a sort of "patterning" of your ongoing experience.

POST: I'm interested in the idea of jumping - help me test it

The simplest way to demonstrate that there is "something to this", is to perform the exercise repeatedly over an extended period for many different outcomes, until eventually the idea that it is "coincidence" becomes ridiculous (or doesn't, of course). This then leads you to examine your assumptions about the "nature of experiencing", and things progress from there. Beyond that, if you are looking for "proof" of something, though, you should be clear about what, exactly you are looking to prove. What do you mean by "confirm if something happens". What precisely is the "something" that you are trying to confirm "happens"? What does the term "jumping" mean for you, basically?

Of course, it is not the pouring of water as such that produces an outcome. And the outcomes from that process tend to unfold as "seemingly very unlikely, but still borderline plausible and non-reality-breaking" narratives. We demonstrate to ourselves that something is going on, and then we move onto examining the nature of that "something". I think your two suggestions might be skipping ahead too much, before you've really thought deeply enough, and so might neither prove nor disprove anything as they stand.

POST: Is this a stupid concern?

Nobody has jumped yet. We all want to jump dimensions but there hasn't been legitimate proof that anybody has jumped to a radically different dimension yet. That's what we're all hoping for - real evidence of that but there hasn't been anything. It's like everybody comes back here empty-handed. No worthy proof of any sort of real Dimension Jump.

This... isn't how it works, Roril! I thought we'd already worked through this previously?

If someone says something about their experience to you, then that experience of "someone saying something about their experience to me" is an aspect of your ongoing experience. There is no "outside" to that. This means that any "external" proof of a change is actually just your own experiential content. It's like being in a dream and waiting for someone to tell you it's a dream. If someone did tell you it was a dream, then it would actually be you telling yourself that it's a dream! The idea that one of your dream characters wakes up, discovers it was a dream, and then returns to your dream to tell you about it, would be ridiculous.

No we're the dreamers, though!

You are the whole dream.

Johnny Deep.

Mister Literal!

POST: Dimensional Shifting in a nutshell

Let it be said first that, you are ALWAYS shifting. You are shifting multiple times as you read this comment.

I'm not sure this is necessarily the best (by which I mean most useful) way to look at it, since it conflates "current sensory content" with "current state", potentially. It is, I think, much more useful to conceive of a "state" as comprising the current set of pattern-facts that are contributing to your experience, and a deterministic set of "moments" corresponding to that. That way, a "shift" or "jump" can be defined as an intentional change from one state to another, and a "dimension" is basically a state consisting of a particular set of world-facts. "Time passing" is then considered to be a static pattern associated with a particular state. This doesn't necessarily affect your overall descriptive scheme, though; it's just a point of clarity. (The same consideration also applies to the Infinite Grid and Hall of Records metaphors linked in the sidebar, which cover similar ground.) However, it does lead to another important aspect to this:

At this moment shall we say, at 3:01pm, I am at point A.

In what sense are you "at point A", though? What is this "I" that is there? Related:

Again, we humans are limited.

In what sense are we "humans", if "being human" is actually just a particular type of experience associated with a point in a configuration space? Surely you are having a "human-formatted experience", rather than actually being human?

Thanks for the clarification G! :) Yes you're right, our body (human-formatted experience) is inside our consciousness not the other way around (consciousness being inside our body). I still have the habit of considering our temporal selves as a reference point haha.

Right. It's a bit counter intuitive, because we can't actually think about this, since we are talking about the subject to all objects, and words and concepts only deal in objects - but it's beneficial to point it out. The primary benefit of noting this explicitly, I think, is it makes it clear that all content and formatting is a "modulation of awareness" - including the metaphors we've just been discussing. It's all "patterning" and none of it is fundamentally true, only relatively so. This reminds us that the only thing that is unchangingly true is "awareness" (or "consciousness"). And it's not even "our" consciousness, because it is "before" division and multiplicity; it is simply the property of being-aware, independent of any particular content or structuring or apparent perspective. Basically, it underlines that all aspects of experience, even very basic aspects, are on an "as if" basis only. This leads nicely to a consideration of the "how" of shifting, which might be usefully described as a shape-shifting of oneself, as awareness, to another "as if" form.

Q1: In what sense are we "humans", if "being human" is actually just a particular type of experience associated with a point in a configuration space? but where do people - yourself included - exist in relation to me? people have mass and location despite the content of their 'personality' and 'experiences' if I assume my experience of my body incorporates the totality of the cosmos1A 1B 2 then 'finding' people shouldn't be so mysterious presently I feel i have to cut all the bonds of speculations of matter being existential separate to awareness and in that regard, people would be as objects too Rupert Spira - Consciousness Is Not Produced by the Brain [https://www.youtube.com/watch?v=icBYIUTZ5gI]

Although, really, "mass" and "location are ideas, concepts we use to describe our experience; we do not actually experience them as such. People are essentially sight, sound and texture within mind, and everything else is inferred.

Could you explain what you mean by "division and multiplicity?" I'm a tragically linear thinker and none of this will ever work for me until I iron out these details.

I just mean that the fundamental state is undivided, has no property other than being-aware. So in that state there is not "many things", but also not "one thing" either: "things" and "numbers of things" are just meaningless when talking of that state. It is the "subject" that takes on the shape of apparent objects ("division" into objects and "multiplicity" because immediately we are dealing with "countable things") but is not itself an object. It's hard to describe (impossible, in fact), because thoughts and concepts immediately involve dealing with objects, but we can always point to the fact that the context of our experience, our experience right now, is always that subject, which is us.

POST: Theoretically, could you jump to a fictional universe/ a world you created in your mind?

How can you tell that your current experience isn't already a fictional universe that you created, perhaps accidentally, in your mind? How could distinguish between this being a "real place", and a "persistent realm" that you'd set in motion while forgetting your experience prior to that? (I mean this seriously: look around, what are the actual signs, if any, that could tip you off? And consider: are those signs not just a part of the "fiction" of this experience?)

It seems a very depressing prospect.

I don't think it is, though. Although in that comment I'm presenting it as "hey perhaps you did this unwittingly", in actual fact the concept lends itself to a positive interpretation, that of great possibility, great potential and freedom once it is grasped. And for people who are kind of "down on death", it's surely a prettier picture. Remember, in this description a "hard reset" couldn't be done to you from the outside (because there is no "outside" in this view). It's something that would occur due to ignorance or deliberate choice. The former, we can address. Is that not hopeful, rather than depressing?

Could the patterning model be intrinsically anti-entropic?

Fundamentally, it is "before" the idea of entropy, because even "things change" is a pattern. Or more specifically: "time passing" is a pattern, an experience, rather than a fundamental thing. So "eventually" one is bound to realise rediscover one's power. You are eternal "being" but you are not doomed to endlessly repeat, because you are not a finite mechanism. There is no "logical reason" at all, then, why the whole thing can't just drop away, right now, and you switch to a state of infinite abstracted possibility - free from that crappy hellishness. The issue is, perhaps, that it must occur to you to ask - or in some way end up implying - this. I guess that if the same power that moves your arms and legs (or rather: takes on the experience of apparent movement) also moves mountains, it's no good if one doesn't actually attempt to use it in that way, with commitment?

So, what reassures you that this is not a problem?

It's inherently not a problem, though, right? Unless you are still identified with being a particular person (or person-pattern). Once you realise your actual situation - if you are identified, instead, with the property of being-aware - then it isn't. This occurs in a couple of ways, in fact. First, you don't mind the idea of things shifting in the sense of it being an existential problem. Second, you know that if you want you could establish a context to experience, a context that is independent of its content.

Nonetheless, there are things outside our direct control. Things that happen to us, apparently without our deliberate choice (sometimes against it).

The issue, perhaps, is what exactly one means by "control", "us" and "choice"?

Arms and mountains are identical in nature and their shifting is identical in nature, is the point. Coming to that conclusion, I'd say, is the "purpose", after the fact, of exploring these things (if we should call it a "purpose"). Namely, coming to a direct understanding of the "nature of experiencing" and, secondarily, being able to leverage that in order to summon desired experiences.

But synchronicities like this one seem to suggest a not-so-controllable "what you focus on, expands" type of "mechanism", instead of a neat "what you decide, happens".

I'd phrase it as, that the way in which one changes one's ongoing experience is by "increasing the relative contribution of a fact or pattern". In effect, one shape-shifts oneself to a new state. There is no "way" or "method" or "mechanism" for doing this; one simply adopts the new "shape". Any apparent experience of cause and effect are actually both "effects"; all experiences are "results" and no moment of experience "causes" another moment. Pondering - This means that the devil's in the details somewhat when it comes to things like "decisions". If we translate "decision" as "asserting the fact of something being true", then we're on the right track in terms of a description. This is different to some interpretations of "decision" - and indeed lots of other words we try to use to point to this - most of which maintain a separation between "decider" and "world", for example. The changes we're talking about here are literal and direct, with no medium or intermediary. If you ponder this - and you must do so from a 1st-person perspective, because there is no other - then the result can be even a slight feeling of claustrophobia, because you can't "get outside" of this. Attempting to "take on the shape of" the experience of capturing the idea of "taking on the shape" is conflicted. However, the attempt to do so, and the giving up of the attempt, is often an nice way to cut straight to the insight. (See also: that feeling-out exercise, elsewhere.)

I have no way to know if the right interpretation is the idealistic one... "Oh wow, I'm awakening to my true nature!", or the materialistic one...

It doesn't really matter. All your experiences are you "taking on the shape of" an experience; all your thoughts about experience are you "taking on the shape of" the experience of thinking about experiences. All interpretations are incorrect - simply because they are interpretations. We might recall the metaphor of the sandcastle: It is not possible to build a sandcastle which captures, in form, sand and the beach, even though the sandcastle is both sand and the beach. If we build sandcastles and call them "sand" and "the beach", they will both represent and not be, sand and the beach; the interpretation will be right in the sense that it is what it is interpreting, but it will be incorrect as an interpretation. (This is just another way of saying, "the 'awareness' that can be spoken or thought of is not the true awareness".)

Could you please help me understand this with an example?

So, if one is identified, say, with a particular location in the body space (many people identify "me" as a small sphere somewhere behind the eyes, for example), then when experiences arise which imply that location is no longer there, your "me" content will disappear also. However, if one deliberately "takes on the shape of" being, say, an "open aware space within which all sensory experiences arise", then you've brought into play, identified with, a foundation which is independent of the usual world content. What you actually are is "that which takes on the shape of" 1st-person experiences, so that never dies. However, if you do want to maintain a particular sense of identity, a continuity of experience, then you must bringing to experience a persistent aspect such as that, to which you can attach a "me". To get a feel for the larger point, stand up and put your arms out into the space around you. Now, imagine the your arms are extending into space, somehow in all directions, such that the entire moment of experience is your body. Note: you are the moment and its context, you are not "the environment" in the sense of a "place". Then, imagine that you are a "shape-shifter", but instead of just a body space which shifts, the entire space is you. You are "non-material material" which shapes itself into experiential states, then.

"choice" : intending an increase of the relative contribution of certain facts or patterns

So, now we have to be very specific about what "intention" is, in the sense that it is literal. That is, if "an intention" is the pre-existing pattern one is bringing into prominence (along with its logically-implied extended pattern), and "intending" is the shape-shifting act of doing so, then there is no actual "doing" of it. For example. If one is sat down and then stand up, one either stands up or does not. Here, the "intention" is the pattern being-standing-up, and if one fully intends it, it is true: the experience of "standing up" arises. Now, why is it that one does not experience being-sat-down in one moment and then discontinuously being-stood-up in the next? In this description, it's because there is already an entire world-pattern, structured in a certain way, aspects which is associatively triggered by the intention "I am going to stand up" or "it is true now that I will be stood up then". There is also the issue that people don't actually specifically intend discontinuities; they intend fact-patterns which are overlaid of the existing world-pattern, rather than deformations of it.

Why, then, arms obey every whim and mountains stay still?

Your arms don't obey your every whim, though, do they? Your intentions are incorporated into your experience, and your arms and legs follow certain patterns plus that intention. If you don't address the world-pattern in order to change that, or don't specifically intend discontinuity in your experience (perhaps be re-considering your idea of what "the world" is, and asserting a new perspective), or don't completely release the current pattern temporarily but absolutely, then that's how things unfold. It's also worth noting that your idea of "you" is a pattern which might place certain apparent limitations. This is what I mean by intention being direct and literal amendments to your current state. Meanwhile, though, it's worth noting that, if you pay attention, things like mountains do move all the time. Both in the sense of the apparent fact of where they are, but then in the seemingly cheating sense of when you apparently move your head, or blink, or turn away, or change location. (I say "seemingly" because it's not really cheating - it's a worthwhile path of contemplation. In what sense is a mountain in a particular location, anyway?)

POST: Is it possible to travel to a fictional universe already made/fanfiction?

Do a search for "fictional universe", since this has come up a few times over the last couple of months, and the previous discussions cover a lot of ground I think. For example, /u/dungjames posted about this, and another post a couple of days ago, but there are more in-depth conversations previously involving "persistent realms" and so on.

Dreams to me are more complicated than rocket and physics combined, i mean if i just slowly grasp something in my mind i can understand it and eventually do it but my own mind is against me because it just having a hard time while my body does is smile and do what it can to enjoy the day

The issue with dreams is, there is no "how" to them, other than fully deciding and keeping in mind that you are going to dream. There not really anything to "understand" at all. There is no complication, because dreams are "made from" visuals, sounds, textures, and so on, and felt-knowing. There is nothing "behind" the dream to learn or work out. You simply... dream.

Then my dreams are so unstabled because of the amount of information going to my head and emotionally issues

You can overcome that, though. Something that helps, is reading around the topic a bit more, so that your idea of "dreams" becomes more stable. (Lucid Dreaming: Gateway to the Inner Self by Robert Waggoner is worth a look, in my opinion.)

I also really recommend spending some time just not bothering to think - to "cease interfering" with your experience. A daily 10 minutes is good: lie on the floor in the "constructive rest position", cease interfering with body, thought and attentional focus, just "let whatever happens, happen" with no aim. Over time, you'll find yourself naturally levelling out and opening up, as "stuck thoughts and incomplete movements" unravel themselves. The clarity that comes with this will help your thinking, emotions and dreaming.

POST: I tried to jump and my dietary preferences drastically changed

I'm not sure I really followed that... much at all! In terms of an overall description rather than the parts, that is. How can you be "close" (or indeed any distance at all) from "the source energy you draw power from"? The "pain and indifference associated" with a meat product isn't your pain; in a description involving "3D cross sections of timelines" the idea of a pain external to you is meaningless. Finally, surely it takes no time at all to "get through time" - by definition. There is, however, definitely something to be said for not obsessing about synchronicity (particularly if you are prone to being attracted to the "messages from the universe" type idea) because it quickly escalates and deepens, becoming distracting, especially if you try to "work it out".

Let's take this a step at a time.

Every action you do in the 3rd dimension creates infinite 4th dimensions...

What leads you to believe an action in the 3rd dimension creates anything at all? Are you not inclined to think that all things are eternal, pre-existing? In which case, a "3D experience" is a selection of experience - as visual, auditory, textural, etc, moments - not a creation. And if that were the case, what would this "energy" be, exactly? Other than a word for "the stuff of which experiences are made" - which is to say, nothing at all, other than the property of being-experienced. Beauty, then, would not be something that was "created" by veggies and plants (for example). Rather, it would simply be the recognition of the nature of experience, rather than the content of it. Your 1st-person experience (being all there is) would be inherently pure, regardless of its present "shape". Meaning that 'light' and 'dark' would be, fundamentally, illusory - a fiction in description, and not actual.

Q1: Hi, I'm interested in what you've written about synchronicity. Do you think synchronistic events are symptoms of 'dimension jumping?' I have been reading things on this sub for a couple of months and it fascinates me, but I have never set a specific intention to 'jump dimensions' before, as it's written about here. I have, on the other hand, become very interested in the concept of synchronicity in the last year, and I think these such meaningful coincidences/synchronicities have happened to me on a number of occasions in the past year. I have done research into Carl Jung's work and read the book about synchronicity, and I think about it a lot. With this in mind I'm interested to know how you perceive synchronicity and how it relates to dimension jumping? It was a pleasant surprise to see it mentioned on this sub!

So, I don't think they are a symptom of "dimensional jumping" exactly, so much as an indication of how our ongoing experience works anyway. Our standard description of our situation is that we are a "person", an object, located in a "world" which is a "stable, simply-shared, spatially-extended place unfolding in time". This makes accounting for things like synchronicity, and many other experiences, quite problematic. However, when you actually attend to our experience as it is we find that, loosely speaking, what you truly are is an "open aware space" within which experiences arise. We can conceive of this space having all possible structures "dissolved" in the background, but with a particular set of those structures being relatively dominant at any time. That is, contributing to ongoing experience. We are "patterned"; we are in a particular "state". Although we think of our experiences being "out there", they are actually arising within us. Synchronicity, then, is a product of our present "patterning". This is true of all of our experience, however synchronicity sticks out because, unlike other content, the synchronistic experiences are not fully defined in time and location. In a sense, it feels as if there are images that are somehow "overlaid" upon our perception; they have been "drawn on top of" our unfolding world. This is actually not a bad way to describe it...

Hence, we can summon owls and we can conceive of ourselves as a self-experiencing context rather than as objects within places.

POST: I'm lost. Need answers before jumping.

I so disagree. ;-) What's a "vibration"?

...In a sense, yes, it can be semantics - but I think it's important to step back and recognise the "meta" context to the various descriptions used. (Interrogate what semantics themselves are, in a way.)

In other words, you can have experiences "as if" it were true that there as such things as "vibrations" and branching outcomes, and you can have experiences "as if" there are "dimensions" and you jump them - but actually those things have no causal power, they are essentially descriptive frameworks, concepts only, which don't really describe anything. Parallel constructions in thought. That is, they are ways of formulating intentions, rather than "what is going on". This might be important, because if you have this the wrong way around - if you think that frameworks describe what is behind the scenes in terms of "fundamental truth", rather than being conceptual building blocks from which "relative truth" can be constructed and brought into experience - then it's easy to end up chasing your tail, unwittingly creating muddled patterns of experience... And thus end up adding all sorts almost "superstitious" additions, in pursuit of "how it works", when in fact there is no "how it works" or method or mechanism underlying experience. Hence lots of "here is my improved two glass method" suggestions, which mostly add more sensory theatre, and perhaps obscure what the whole thing is possibly meant to point to.

I think that you yourself are caught up chasing the tail with your endless questioning!

"Endless questioning" is exactly what we should be doing, though?

The point is to explore and investigate both experiences and descriptions, to experiment and interrogate to get to the bottom of them. Otherwise we're just picking stuff to "believe", with no basis - we're fantasising.

I think you need to do as you say, pick one perspective and keep experiencing your world through it.

I don't say that, though, necessarily. Why pick one perspective and follow it? At least, if one is going to pick a perspective, then it seems to be a good idea to choose it knowingly - to have a handle on what "a perspective" is. Chasing your tail arises when you try to use concepts that, while they are internally consistent, don't have an underlying foundation - castles in the sky. Carefully examining those perspectives (endless questioning!) is exactly how we avoid chasing our tails!

You should help then find their own perspective through yours, not force yours.

Nobody's forcing anything?

How does anybody "find their own perspective", if there's no discussion and challenge (by which I mean: in the sense of picking at the underlying ideas, not in the sense of fighting to be "right" or to win an exchange). There are other subreddits where people can embed themselves in fluffy concepts and wishful thinking - this, generally, is not one of those. The focus is more on experimentation and examining the descriptions used, to see what (if anything) makes them tick. Although, of course, engaging in that is optional, I'd say it is the way forward in terms of making progress. Fuzzy thinking and "leave my perspective alone!" gets us nowhere.

I'm talking about saying things like "lol not true "

Well, I've definitely never said that!

but you are taking it way too far, and it is uncomfortable... You should foster conversations, not confront no stop.

Fostering conversations is generally what happens, though? My "so disagree" was playful, the "what's a vibration" was an opening gambit to start things off. (It wasn't intended to be confrontational.)

I think it needs more openness.

It is quite open. However, it is also not just another /r/psychonaut or /r/occult or /r/lawofattraction, because what would be the point in that? There is a fairly specific idea underpinning it, as articulated in the sidebar and the links in the introduction. Which is, really, to also dig into the idea of "understanding", as well as views of understanding.

I only want to clarify things by adding new ways to understand the same thing.

Of course. Perhaps I could have been clearer, but what I was fishing for when I said "what is a vibration?" and then...

In other words, you can have experiences "as if" it were true that there as such things as "vibrations" and branching outcomes

...was really, what is the nature of a vibration, and how exactly does it lead to a shift in experience, rather than just the surface concepts and phrases. It wasn't meant to be a "stop". For example, you say:

So, the more you "fake" a feeling, the more that feeling is part of you, the more it is part of the world.

Okay, but what is "the world" and what are "you", if that's the case? Obviously it can't mean a world as in a "place" (that is, a "stable, simply-shared, spatially-extended place unfolding in time") and the "you" can't be an object in an 3D environment. That's what I mean by digging deeper. It's "endless questioning", but with a purpose, rather than just tail-chasing. "More openness" isn't the same as "avoiding examining what is meant by something, in detail" so that people don't feel "uncomfortable", I'd hope! Because, I'd suggest, when we really unravel this - our assumptions about this - it is an uncomfortable thing, although ultimately worthwhile and beneficial.

What do you think of the theory about the many yous? For example, there is the 3D you, the 4D you, guiding the 3D you.

It's a little like JW Dunne's idea of The Serial Universe, which was basically a diagrammatic representation of multiple levels of "observer", as a means of wrestling with different states and change. I think the error in it, though, in terms of linking it to the properties of actual ongoing experience, is that it assumes that the "observer" (or better: experiencer) is located - is an object, has a boundary and a restricted content. But in actuality there are no levels or hierarchies; what you are is not an object; this structuring is just an aspect of thinking, not of experiencing as such. So, I think that it is better to consider the "you" as the starting point, as the non-object subject of all experience, which is then said to "take on the shape of" particular states and experiences. Obviously, this is no "you" in the sense of being a "person", but rather that-which-experiences - with one of those experiences being to take on a shape (as state) that is "as if" one is being-a-person-in-a-world. In such a scheme, the only fundamental property - the only unchanging truth - would be the fact of the property of being-aware or "awareness". (That is, before even any notion of division or multiplicity or change.) Everything else would be relatively true only, on an "as if" basis. In this case, "dimensional jumping" or any other conceptual framework for modifying one's experience, would just be a structure to assist the formulation of a desired change and adopting it fully. The "cause" of the change wouldn't be "energy" or any other idea or indeed experiential content - the only cause would be the context, the context of you-as-awareness, which would shape-shift into a new state and experience, a new set of relatively-true patterns or facts.

The benefit of this view is that it dissolves the boundary between "what I am experiencing" and "the description of what I am experiencing". They are both experiences (with the latter being "the experience of thinking about 'experiencing'"). It also highlights that there is nothing "behind" our experience: it is a pattern of and as "awareness". Intending change, then, is a matter of taking on the shape of an idea of experience (a shift in itself), and then taking on the shape of an idea as experience. Unfortunately (as you can tell!), this is very difficult (in fact, impossible) to put into concepts and language, because that will always be "inside" experiencing, and "parallel to" the content of what we might call the sensory moment. So we tend to get into verbal tangles that are intellectually unsatisfying, even though they point to (and are "made from") the direct truth of the matter.

To recycle a previous metaphor:

- **The Beach:** The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.

When I was asking "what is a vibration?", therefore, it wasn't that I was challenging your description and suggesting there was a better one, one that I preferred and which was preventing me being "open" to yours. Rather, it's that I was pulling into the discussion the whole idea of descriptions as being "right" or "true" at all, when it comes to this subject, and when it comes to experience generally.

(You can skip to the headlined part if you want to avoid the discussion.)

I am trying to give additional perspective, and you wanted to be playful...

I don't see the problem, frankly? We can talk vaguely around the surface of the subject, or we can get straight to the heart of it, which is confusing initially. Of course it is! Otherwise there would have been nothing to discuss or have a subreddit about in the first place.

I suggest you be a bit more stable and less "ready to set things straight" all the time.

Do you mean: avoid addressing underlying points or having a discussion that is worthwhile, and instead having one that feels nice rather than has a chance of going anywhere useful? ;-)

This implies that something is having the change. The idea of experience comes from somewhere! It implies the thing having the awareness had the concept that there is more to it.

The "thing", though, is not a thing. It is not an object, although it "takes on the shape of" the experience of apparent objects. The clumsy wording is an attempt to avoid suggesting a division between an experiencer and the experience; they are the same thing. (And it's why we invoke lots of metaphors and imagery such as "the beach", "the blanket" and so on.)

That's the point, and why...

There is no knowledge of the inner workings, which makes it as satisfying as science two hundred years ago, as you have no real tools to measure anything!

While for intellectual satisfaction we naturally feel the urge to want to understand "experience" and therefore "jumping" conceptually - that is, mental objects connected to and having effects upon other mental objects, representing supposed "real" objects - and come up with a "how things work", ultimately we cannot in this case, because this is the "stuff" that all such concepts are "made from". In other words, this particular relationship cannot be thought-about. There is no deeper underlying "how it works" or mechanism to this, in the usual sense. Any apparent "how it works" is itself a pattern in experience. There are no inner workings in the usual "methods" sense of it. **But there are patterns**, and ultimately "dimensional jumping" is about "patterning" experience. The two glasses exercise is derived from that: the leveraging of pre-existing patterns based upon a direct view of the nature of subjective experience. And the concept of "active metaphors", as described in the sidebar, is about patterning your experience using different concepts and noting how your experience subsequently falls in line with that.

People need answers, and this is confusing.

One issue is that the answers are best uncovered by conducting experiments and getting results that break down your assumptions, and get a direct experience of it. You can't really give people a full-proof method for anything - the method is the seed for a custom, personalised investigation; it's basically an exploration of your own patterning, and unravelling that.

I do not mean to start endless debates, I want to start new opportunities for growth.

I understand that, and that's exactly what this sort of exchange is about. We can't "start new opportunities for growth" if we are just doing the same thing over and over again - rearranging the furniture rather than leaving the room. So we get a bit philosophical and metaphysical.

I think you need to put WAY MORE emphasis on the being "in trance, in meditation" aspect of the whole thing.

It's mostly pointless, that's why I don't. It's not really much of an aspect of it at all (although being relaxed in the sense of allowing movement to happen unobstructed, basically non-interference, is always something to aim for). Suggesting that we focus on that, is like suggesting that someone who has lost their keys looks for them in their well-lit house, even though they lost them in the forest.

Being Practical

In terms of being practical, though, I'd say it's best to be "direct" about all this. So, you attend to your experience as it is, directly, by examining it using things like the Feeling Out Exercise or similar. This gives you a sense of your ongoing experience as it is, rather than merely how you think about it.

(It also highlights the whole problem we have when it comes to thinking about experience: we're just creating more experiential content rather than actually getting "behind" or under-standing anything. But then, the very fact that we can generate "thinking-about" experiences does itself give us an insight. How do we do that?)

Other than that, the two exercises in the sidebar, plus the notion of creating metaphors which can be used to pattern experience, are basically it. There is nothing else. But the exercises have to be treated as loose frameworks for experimentation and contemplation, rather than "methods", because the whole idea of a "method" that operates based on a "mechanism" eventually becomes problematic. While that can seem frustrating for someone who wants "answers", the fact is that the whole idea of "answers" and "causes" leads us to miss the point, because the insight we are after is "one step back" from all that. We can end up like someone trying to solve a jigsaw puzzle where the problem pieces are attached to their own hands, but they don't realise it!

POST: My Method (Two Glasses)

Q1: So, basically the same old two glasses with some new age stuff added in? I think I prefer the simplicity of the original.

Q2: I can see why one would say that; this is better for people like me that need more clarification and instruction. I also like this method better because it puts more emotion into it which I feel many lack during the exercise. The first ten or so times I tried the original it did not work because I was so full of questions. When I spoke with Andrew (and I've spoken to a few others) this seems to be a recurring theme with the original method. This is not meant to replace the original, just to help those that need it. The original is like the Mini Cooper, this is like the Mini Cooper Countryman.

Although, if the underlying purpose is to get to the heart of things rather than necessarily to "get results" as such: how much of this is effectively "sensory theatre", derived from unexamined assumptions and concepts?

Good point, but maybe that sensory theatre helps people like me get results.

Maybe. But is it the sensory theatre that makes the difference? Is sensory theatre causal? Or is sensory theatre itself a result? And if so, what is it that causes change? It's worth considering this, otherwise we might be in danger of descending into a sort of superstitious behaviour, due to not realising the "meta" aspect to it all (something that I think ideas like "the law of attraction" can and has fallen into).

Unfortunate Cats & Causality

I guess it's like the age-old saying, "there are more ways than one to skin a cat."

Or, it could be that there is one way to skin a cat (or indeed, to produce any change in experience), but there are many different stances one could adopt while doing so, some which might feel more comfortable than others. Still, it will always be the act of "movement" that will skin the cat, not the particular stance - and in fact the stance is also an act of "movement". (Not a great analogy, that, but you get the idea.)

And so we ask: well, what is this "movement" in the more general sense, for this topic? There's no real way to say it because it is "before" concepts (the thinking of concepts is itself an outcome of "movement"), but we could call it "intending" or "shifting state" or "becoming a fact" or something like that.

Imagining-That

In the Imagination Room metaphor we introduce the idea of imagining-that. This awkward phrasing is to suggest the concept of "imagining the fact of something being true", with any sensory experience being an aspect of that fact-pattern. This, in turn, leads to imagining the fact of properties - see, for example, the blue sphere example:

So, first imagine a sphere in front of you - say, a blue sphere with no particular detail, just floating there. Okay, now imagine a sphere in front of you, identical in every way to the first, except also imagine that this sphere is imbued with the special power to make the room filled with joy. But do not change the sensory aspect of the sphere in any way when you do this. This is basically "imagining the fact of something being true" abstractly. That is, that an object, or your ongoing experience more generally, has a property, without actually visualising any sensory aspects to that property. Instead of doing all the "sensory theatre" of picturing stuff, in an effort to associatively trigger the fact or as an excuse to do so, you can just directly do intending-asserting of the fact into greater prominence. Finally, after taking a pause to clear yourself out a little, instead of using the sphere image, simply directly intend that the room is filled with joy, and experience the result of that. That is, wordlessly intend the fact of: "it is true now that this room is filled with joy". And, um, enjoy.

And so this imagining-that is another way of talking about this, which highlights that the content of sensory theatre is not causal. But then, how so this, we might ask:

Why Did It (Or Did It Even) Help?

until I started reading other's experiences and putting what works for them together that I came up with this and it's worked insanely well thus far.

This brings to mind when people first hear about the idea of lucid dreaming, and spend lots of time immersing themselves in books, articles, and personal accounts of lucid dreaming, pondering the nature of lucid dreaming and imagining what it would be like. The result: they "spontaneously" have a lucid dream, even though they didn't "do" anything to get one. Subsequently, they focus on trying to have lucid dreams using techniques, and they struggle. I suggest this is due to immersion and commitment, the shaping of themselves according to those ideas - basically, they have patterned themselves (in the sense of you-as-awareness rather than as a person) and the content of their ongoing experience subsequently is (because it is inseparable from it) from that new state or formatting. So you were "reading other's experiences" and accepting what they say worked and dedicating yourself, in a committed way, to coming up with something that worked. But it isn't the technique that works, that has made the difference - it's the fact that you focused upon, and assumed with full commitment either directly or via implication, a particular patterning. This is why it "worked insanely well" for you - and why although others might get a brief boost from something fresh, they probably won't get the same outstanding outcome.

There is something more to be said, though:

Two Glasses & Patterning

The original instructions for the Two Glasses Exercise, which are stripped down to the minimum required for a reason which should be clear, leverage an existing abstract pattern which is fairly universally shared, while also minimising the possibility of undoing the shift that is produced. Actually, it's really two patterns: that of shifting amount-intensity-location (modifying the relative contribution or existence of a quantity), and that of association-overlap-identification (creating a handle onto pre-existing states or patterns).

This is the "cheat" involved. However, having gotten results - which is greatly existed by, as the instructions suggest, following the instructions as written and then carrying on with your life without over-thinking it or putting effort into it - and then having experimented with different and increasingly unlikely outcomes which obviously cannot possibly be related to a literal pouring of water or labels, the more general notion and prevalence of patterning becomes apparent. (Particularly when considered alongside the Owls of Eternity exercise, the metaphors linked in the sidebar, and the notion of "active metaphors" more broadly.)

I'm interested in your reply to this - do you use the original verbatim or have you tweaked it?

From the above, you get the idea: the method doesn't really matter, although it is a hook into and a platform from which to explore the nature of experience (which was the original idea of it: it shows "something's up!", and prompts: "what is the nature of this?"), after which you could experiment more directly.

Q3: Hey TG! Can you please expand on the following:
Actually, it's really two patterns: that of shifting amount-intensity-location (modifying the relative contribution or existence of a quantity), and that of association-overlap-identification (creating a handle onto pre-existing states or patterns).
Also, what is your opinion on the effectiveness of your emotional state in regards to all this? Would you say your emotions towards manifesting something you desire is irrelevant under the context of you-as-awareness? Is the connection between the two merely a perceived pattern?

Ah, by that I meant that we are not completely void emptiness before we do this stuff - we have patterns of all sorts, from the fact of the senses, to that of length and change, and ever more abstract ones (which can't really be conceptualised). Basically, the world that we are "makes sense", and that is because it is a set of patterns, as selected from the background of all possible patterns. And the two glasses exercise operates by, instead of having you having to intend an desired fact-pattern (outcome) from nowhere, piggy-backing on a couple of already-active ones. Specifically, the meaningfulness of "amount" and "location", and the explicit or implied assignment of meaning (the labeled-glass water levels are implied to mean the "intensity" of the current and target situations, become "handles" onto them). This not something you have to "do" as an act, I hasten to add, it comes for free with the "dumb patterning system" that you are - and in fact "trying" to do it tends to get in the way, since inevitably you use effort or bring to mind other patterns (and what is effort? usually just the production of a feeling of muscular tension, which has it's own associated extended pattern).

As for emotional states - I'd say that emotional content is just like any other content, a sight or a sound or a smell. It is tempting to treat it as special because it can't be articulated well, seems all-encompassing because it is not so clearly located as other sensory stuff. However, I'd treat it as part of a moment. For sure, by associative triggering, deliberately holding a particular emotional state is like selecting out patterns associated with that state versus others, but I don't think it's a great approach overall. It's a bit like, again, going back to visualising something ("a blue ball") without the intention ("picturing this blue ball means-that my exam will work out great"). The intention - the explicit or implied statement of something being true - is the actual pattern that you are seeking to make more dominant, everything else is sensory theatre and non-causal (which you are, ironically, triggering by intention as well: "it is true now that I am perceiving this image"). Of course, it's difficult to make broad pronouncements here beyond the basics, because we're all dealing with different initial patterning, different extended patterns associated with things like (for example) "a blue ball" or "the feeling of being melancholy" or whatever. Hence, the encouragement to experiment and explore, because there is no method or mechanism as such - for they, too, are patterns, with nothing solid and permanent underlying them. ("Active metaphors" being the concept of coming up with "formatting" which you then adopt to pattern a "how things work", rather than just a "what's going to happen".)

POST: Ideas for a group jump

There's potentially a problem with jumping as a group, due to a possible lack of "other people".

I know what you mean, but then again nobody can prove it.

We have to ask, though: prove what, though, and to whom?

If there is no difference between having an experience "as if" something is true and it "really" being true - and I suggest there is not - then it comes down to the content of your experience, and the nature of it. You can only demonstrate things to yourself, whether there "really are" other people or not. You can notice the variability in content, and you can examine the "meta" of your experience, how it is rather than what it is formed into currently (as an apparent first-person perspective).

This life experience could be the result of my mind creating this whole reality and you guys don't really exist except for me.

I think the flaw in that description, potentially, is in what you are talking about when you say "my", "me" and "you guys". The sense in which we might say that there are no other people - that is, individual consciousnesses "inside" bodies - is that there are no people at all, including you. You are having a being-a-person-in-a-world experience, but fundamentally you are not a person. You are an experiencer which has taken on the shape of an experience, a structured or patterned moment. You'd be better described as "awareness" having "taken on the shape of" the apparent experience of being-a-person.

Note, I don't say "**an** awareness" or "**the** awareness" (or "consciousness") - just "awareness". That is, there is not even one awareness, because it is "before" countable objects, hence saying something like "our combined awareness" doesn't mean anything. (The Feeling Out Exercise and the discussion in the link is meant to draw our attention to this, although I'll add that it's important to actually do it rather than just think about it.)

All of which is to say, you could quite possibly have yourself an experience "as if" a group of people all get together and make a change in the world, but all you'd "really" be changing is the content of your own sensory experience (that is, the shape of you-as-awareness, which happens to be structured currently as an apparent you-as-person). That's good enough, maybe, but in terms of understanding "what is going on" more deeply, there are some things we should bear in mind regarding our assumptions, perhaps.

You can keep telling yourself that you are god controlling an avatar, but that doesn't necessarily make it true.

That's not the sense in which it is meant, though. It is more like saying that what you truly are is a "material" whose only inherent property is being-aware (hence "awareness") and which takes on (or has taken on, and perhaps not deliberately, in the sense of "after deliberation") the shape of patterned states and, therefore, experiences. It's not like being a God, as it's usually conceived of. The person you seem to be isn't an avatar. The "person" is an idea or thought you have from time to time; you never actually experience being a person as such, only sensations and perceptions "floating" in and as you-as-awareness.

There could an objective reality and you would have no way of knowing the difference.

If you don't know the difference - if it is not possible to experience the difference - then the concept is meaningless? The notion of an "objective world", it is has been said is construct of convenience with no evidence:

It's said that in earlier civilizations, people didn't quite know how to distinguish between objective and subjective. But once the idea of separating the two gained a toehold, we were told that we have to do this, and that science is about the objective. And now that it's done, it's hard to turn back.

If you think about an "objective world" now, what form does it take (it is a thought-experience, surely?) and where is it (within and as awareness, surely?). If you attend to your direct experience, now, as it is, there is no place for an objective world to be, other than inside awareness (loosely, "dissolved into the background" of the present moment), which means an "objective world" is in fact a subjective thing. And that's just the thought of an "objective world"; the actual objective world would not even be a conceptual object, or an object at all. The notions of "objective" and "subjective" both logically collapse into something like the above, as intuited from direct experience: there is just patterns within and as awareness. Basically, we're saying that all things are within the "subject" - and the subject not being an object, having no edges,

boundaries, division or inherent properties, there is "not even" one of them, and from this it follows that there is no "objective" world, because there is no room for boundaries of "type" (which is required for an objective world to be able to impinge upon a subjective world). If there were an "objective world", then, it would have no interaction with, and therefore no effect upon, your subjective experience whatsoever!

Maybe there is a real reality out there and you can't see it and/or comprehend it but it would still be there and exist.

But if you can't tell, in what way does it exist for you?

And as we've noted, directly examining your experience (which is not just the content of your senses) leaves no place for an "external" or "independent" reality (which is basically what we mean by "objective"), because it has no "outside". Returning to the "meta" of all this: when you think about "an objective reality", what exactly is your experience of doing this thinking? And that experience, that thinking and the content of it, in what way does or could that correspond to a "real" reality, one that is not subjective? Are you not just making "sandcastles" in the manner of these metaphors?

The Beach

The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.

You have to take a step back. The "objective world" concept is only addictive, only "seems right", in terms of a particular structure of thought. If you step back from thinking, though, you can see that this structure is just a "castle in the sky", a self-consistent conceptual pattern which is just floating there without an actual foundation, no grounding in direct experience. (Besides, that is, the experience of "thinking about the ideas of objective and subjective".)

In a way that feels real enough when I feel pain or hunger.

But that's got nothing to do with "objective". (After all, you can have pain and hunger in lucid dreams. When Johnson says "I refute it thus" to Berkeley's subjective idealism, he does not actually refute it - he illustrates it.)

When it is said that there is no world external to you, it doesn't mean there is no world external to what is labelled "the person" (by which I mean, a particular set of sensory patterns and concepts that are a subset of the world); there's just no world external to the experienter.

Well, look, I read Descartes and the part about "I think therefore I am" did change my life.

I meant it more in the sense of noting that descriptions are themselves just experiences, and so they never get "behind" the nature of experiencing. The idea of an "objective" world never gets "behind" subjective experience; it is meaningless when it comes to tackling the nature of experience itself. It's a little different to saying "the only thing I am certain of is that I exist", because it takes the next step and examines what it means to think of existence at all (and whether it can be thought of - I say not).

That being said, there is no way for you to differentiate between a reality that you created with your thoughts or one that really does exist.

If there is no way to differentiate, then the question is meaningless, right? But there are assumptions in that sentence we could unpack. For example, are we saying that we are creating reality "with our thoughts"? (Aren't "thoughts" really results of something, of "intention"?) And is our definition of "really exist" just "something that isn't created by our thoughts"? (We'd have to nail down what causes thoughts first, I'd say.)

Even the word "reality" is a problem: what do we mean by that? It's a form of "zoning" of experiential content or of concepts. If all zones are still within and as "awareness", then our questions would be better formulated differently. How about this. We can ascertain directly that:

- All experience (including the experience of "thinking") arises within and as awareness.
- It seems that we can direct the content of experience to an extent: we can intend the "body" portion of experience and get immediate sensory change; we can intend thoughts and they appear immediately.

And then: Is our question not really simply that some aspects of our patterned experience seems easily directed (intention and sensory result are nearly coincident, spatially and temporally, everyday movement and thinking), other parts seem less easily directed (intention and sensory result less coincident, Two Glasses style), perhaps not at all (intention to reformat world facts?). So are we not unwittingly equating "inertia of intentional change", as seen through a descriptive framework of "world as a spatially-extended place unfolding in time", with "really real"?

Who wants to live in a world where Dolly doesn't have braces.

Well, I suppose Dolly might!

My point is that I would rather tackle the nature of reality instead of experience... You have no absolute truth.

The "problem" is that "reality" is just a concept you have; that that concept is just an experience (of "thinking"); and that all you actually have is experiences. The "absolute truth" is whatever is unchanging, and the only thing that is unchanging is the fact of the property of being-aware. However, I will add that when I say "experience" I don't just mean the current senses of visual, auditory and so on - I mean the whole "being state" of now, including that felt-sense summary, and all that stuff.

Again, even if we cannot with current technologies, maybe someday we will and you have no way of claiming that this assertion is false.

See, that doesn't help though. It's like saying that, when in a lucid dream, you might discover a machine which will let you distinguish between the content of the dream and the "real reality" - but the machine will itself be made from "dream", as will any experiences you have of uncovering the "real reality". The only reality is "awareness" (dreamer+dream), and every experience you have (dream content) is made from "awareness" (dream). You can perceive this to be true directly. No matter what the content of a dream, it is all "dream" and it never gets "behind" the dream. There is nothing "behind" awareness.

You keep referring to "as awareness". I get the "within" part, not the "as" part.

Related metaphor:

The Blanket

What you truly are is the "non-material material" whose only inherent property is awareness or being-aware, and which "takes on the shape of" experiences. Right now, you-as-awareness have "taken on the shape of" the experience of apparently being-a-person-in-a-world. This can be conceived of as a non-dimensional blanket, within which there are folds (fact-patterns) which represent the world (world-pattern or current state).

So the "as" is to emphasise that it's not a case of you being awareness and then experiences are floating inside, with awareness "looking at" the experience. Rather, awareness has formed itself into the experience, so the experience is "made from" awareness. If you pause and "feel out" your present moment right now, you can notice that this is true, directly. The Feeling Out exercise, previously, is about realising that you-as-awareness actually becomes the whole moment. You find that, although you tend to assume that "you" are over here and the resst of the room is around there, when you actually try to locate yourself - locate where you are actually experiencing this moment "from" - you discover that you are the "over here" and the "over there", sort of everywhere and nowhere. You are the whole moment, the whole situation or state.

Can you make 50k appear in my bank account? These are just numbers in a thought simulation right?

Scratch the bit about "in a thought simulation", I'd say; that's another narrative that involves a sort of separation. The question is basically: if my state is "just" me as patterned awareness, why don't all my assertions instantly become true in my sensory experience - right?

Ok so now that we went down the rabbit hole in my other reply, consider this: why would you call it a "problem"?

By "problem" I was referring to a potential issue with the concept of "jumping as a group" - not a problem with looking for the experience of it. The phrasing meant that it's a "problem" in the sense of there being things to consider in the context of "dimensional jumping", not that it's somehow "bad".

You suggest it's pointless, but you could be wrong, isn't it true?

I didn't suggest it was pointless, though? What I suggested was that if someone pursues "jumping as a group" then they might not be doing what they think they are doing, and that there is a benefit in digging into that.

By saying there's a "problem", you managed to discredit my post and you got 5 upvotes. Good job!

The word "problem" hardly discredits your post, though, and the link provides the full context for my comment. Obviously, it was intended to prompt further discussion, such as we just had. This isn't about winning "upvotes" (who really cares about that, on a subreddit like this?). Perhaps the one-liner approach didn't come over quite as playfully as I meant it to, however!

POST: Can somebody please explain the owl method

It's one hundred percent confirmation bias.

Although, we should ask: what exactly is "confirmation bias" in this case?

If the term is taken to mean "noticing patterns that were already there in a three-dimensional environment (a place)", then the extreme experiences one can have often seem to conflict with that. If, instead, we expand the term to mean something like "selecting patterns into sensory experience from a non-dimensional environment (an infinite gloop)", then we've got a description that's more useful, perhaps. In the first case, "confirmation" refers to confirming ones prejudices. In the second case, "confirmation" is more in the sense of confirmation of a property of experience. In neither example, of course, do we have access to an independent external reference against which to measure the "confirmation". However, in the case of "dimensional jumping" and that exercise, we explicitly recognise this fact - and pushing against ("confirming" or not) the standard "world experience" assumptions is actually the basis of the exercise.

POST: My last post here and a golden nugget of advice for you

While I see all related meta-physical perspectives as ultimately the same one from different angles of viewing, I don't want to take away from that concept at the core of this sub or distract from it.

Well, that really is one the core concepts of the subreddit, rather than a distraction from it. That is, along with being hardline on the nature of the relationship between descriptions and direct experience, of course. And hopefully putting concepts like "you", "internal", "universal powers" and even "truth" under appropriate scrutiny - since often there is no underlying content when their meaning is unpacked. We can end up with buzzy stuff that amounts to “What is your why?” (awful movie, don't watch it). We have something that sort of feels good to read, but there is nothing really in it. It may actually be the case that you're not certain about the concept behind the subreddit, given the responses you've given elsewhere? They seem quite vague and fluffy and LOA-ish!

To clarify for new readers: As per the sidebar, "dimensional jumping" is set up as an example of a structuring metaphor, one which can be used to formulate intentions and generate "as if" experiences, rather than something literal or even something fundamental in a symbolic way. This ultimately leads to an examination of what our experiences are actually "made from": what the relationship is between "you" and "the world", as a sort of "practical philosophy" investigation.

Humans are the only ones who wrongly apply these petty, subjective judgments to things.

Although, to be fair, no other judgments are available!

Tech point: Deleting your Reddit account does not delete your posts, unless you manually go through and remove them. It merely changes the username against your comments to "[deleted]".

(Combining two responses:)

The words I've used are completely 'empty' on their own of course if you want to look at it that way, as all words are, but they are intended to get the brain cogs whirring as some kind of response.

Words are "empty" only in the sense that they are not aspects of the direct experience to which they (hopefully are intended to) refer. However, they are aspects of a particular thinking framework or description. The important thing is to elucidate the thinking framework as best we can, and be clear about how it connects to direct experience (or not). Otherwise we aren't saying anything, we're just creating little "castles in the sky" which kind of feel good, but have no grounding or utility beyond that.

You seem to be saying that what you deem to be 'within the realms of LoA' is not suited to be here. I see them as ultimately the same...

Yes, they are ultimately the same, but only in the sense that every moment of experience is ultimately of the same nature - and one may have "as if" experiences themed in the style of "LOA" or "dimensional jumping". To be clear, the main distinction would be that LOA takes its various ideas as literally true; "dimensional jumping" in this subreddit is seen as a structuring metaphor (amongst many; the sub just happens to be named after one of them) which is not itself literal. There are no "dimensions" in the same way that an LOA follower (or similar, this applies to any semi-realist approach) might conceive of "frequencies" and "attraction" and "energies" and so on. And therefore the use of the phrase "as if" refers to the content of one's experience being apparently consistent with a particular description, but that description not being a true explanation of the cause or form of the experience (the context). In a sense, experiences themselves are not taken literally, but the metaphors themselves are literal, in a way.

Trade 'universal powers' for whatever words you like really. I don't use that term myself but it's one I know others identify a certain understanding with, hence why I used it.

It's surely important to specify what exactly you, as the author, mean by "universal powers", rather than allowing others to "fill in the gaps" with whatever "certain understanding" they might identify with?

Otherwise there's a danger we are simply creating highly nominalised self-referential language which has no content, but has the apparent "structure" of meaning - in the manner of hypnotic language forms, for example.

My point was, you can choose to judge yourself as 'unworthy' of receiving any given thing for x, y, z reason/excuse, and can just as easily judge the opposite.

Doesn't your post just basically, in summary albeit in a roundabout way, say "you are worthy and the possibilities are limitless"?

Why, exactly, is someone "worthy" of receiving anything? Perhaps they are not worthy; we shouldn't just take it for granted that we are. And what leads you to suggest that the possibilities are limitless? And why does this matter?

Without being more precise, there's no discussion to be had. Especially if we're just going to end up saying the equivalent of "the words are whatever they mean to the reader, I myself never use these words"!

You get the idea. As mod, obviously I'm inclined to push back on potentially vague cheerleading posts, just to ensure we're engaging in some of the level of a philosophical investigation (with practical aims), rather than the equivalent of YouTube video buzz-up new-agery! Literal vs metaphorical; connection to direct experience; digging behind the meaning of terms; justifying assertions; etc. And it's one way to turn potentially off-topic posts into a relevant discussion.

(Resuming from earlier:)

because these 'frequencies' and 'energies' don't fit into your perception.

This, I think, is the root of our disagreement here - although disagreement probably isn't the right word: it's more like we're actually talking about slightly different things. And I think you've inferred that I'm saying that you are deliberately being obscure or misleading or deceptive, when what I really mean is that as it stands it's not clear how the description used connects to direct experience. It was not clear to me what you were saying.

And so: Let me set out some thoughts.

For clarity, I'm not talking about "perception". That word implies a perceiver who has a certain inherent form, and a perceived which is independent of that and also has an inherent form. It tends to smuggle in certain assumptions about "you" (being an object of some sort) and "the world" (being a place of some sort). This in turn leads us, not necessarily intentionally, to view everything as consisting of "things" that are "made from" stuff. To avoid that, I find it's probably is better to begin with just saying that there are "experiences". Now, we can have experiences "as if" we are "frequency" - that is to say, consistent with the description that "everything is frequency". We can also have experiences "as if" we are person-objects in a world-place, consistent with the current usual view of ourselves. We can also have experience "as if" were are something like void-awareness. And so on. But the only common thread is, loosely speaking, that whatever we are, is "that which takes on the shape of experiences". And any thoughts about something outside of that experience, are themselves just more experiences: the experience of "thinking about experience". There is no "outside", and there is no fundamental formatting, other than the fact of "experiencing".

In this sense, the possibilities are indeed limitless because it can be directly observed - following some experimentation - there is no persistent structuring. And also, more importantly, it can be directly recognised that everything is "you" (in the sense of you-as-experiencer or "awareness"). The direct observation, and the subsequent recasting of the nature of experience and of descriptions, is of course ultimately our main topic here. So, the above is an attempt to illustrate what I was getting at when picking up on "frequencies" and so on, and indicate the level I was thinking at. It seems that perhaps I appeared to be attacking the content of your statements, denying your experience or your formulation, but what I trying to push back on was the context of them.

Looping back, now:

You state this, and then dismiss any other possibility while implying my words and advice are shallow, because these 'frequencies' and 'energies' don't fit into your perception. I accept that your experience is different to mine.

Yes, no doubt the content of our experiences differ, and the concepts used to describe them differ too. Your post, though, seemed to me to present the concepts as being "true" at face value, and that's why I responded in a way that tried to pull at that a little. (Apologies for any apparent condescension; it wasn't deliberate.)

I'm not dismissing the possibility of any experience. But I am, I suppose, dismissing the possibility that the content of any particular experience or description represents something fundamental.

To conclude on the other stuff: If, as moderator, I didn't challenge a post when the meaning wasn't clear within the context of the subreddit's underlying concept, then we'd become just yet another content-free "inspirational" forum with posts consisting of "beautiful messages" followed by "thank you so much this is just what I need to hear right now" responses. The actual intention is that it is an investigation into the nature of experience and descriptions, within a certain framework which might be loosely described as an experiment-led variant on subjective idealism or non-dualism. That's why there's this pushback from a philosophical angle. Hopefully you understand where I'm coming from now!

My post was intended to be certain core ideas I wanted to put out there for people to dive into before moving on from this sub and the internet in general.

The issue was (and remains) that you haven't actually clearly laid out your core ideas at all - to the extent that it is not certain that there is a specific core concept to work with, other than a conviction in believing in "limitlessness". Certainly not in the original post, but also not in this or the other response. In and of itself that is fine, of course - but in the context of this subreddit's central themes or the previous comment where I asserted a particular view for you to expand from or contrast with, we've not got anywhere useful. Now, I love a bit of vague, shifting, comma-delimited, full-abstraction jousting as much as anyone, but in this particular forum it's important to push for some precision! You can't simultaneously claim to be describing core concepts as a seed for discussion, while also suggest that you can't control what other people's interpretations are and that anyway you didn't intend to lead readers in one direction or another. People can't "take in" information by "coming to it themselves", if you don't actually provide any information. Such post-hoc justifications might come over as, at best, disingenuous. But anyway:

If we are to continue, and thus bring the post discussion into relevance for the subreddit, maybe we could tackle one or two particular ideas from earlier, and build out from that:

—

In what way are we "frequency"?

From my experience, we are frequency.

In what sense are we "frequency", and what exactly is it in your experience which has led you to believe that this is the case?

The observations that lead to this might be either experiential content (experiences apparently of something), or an observation regarding the actual form of experience more generally that we might call the context. The latter I have previously referred to as "direct experience" to distinguish it from the description or narrative ascribed to experience (I think you may have misunderstood what I mean by "direct experience" earlier).

In what way are "the possibilities are limitless"?

I suggest possibilities are limitless because why wouldn't they be? Where is the line and who draws it?

Do you suggest that the possibilities are limitless, or do you conclude that they are limitless?

If you are concluding that they are, then there must be a particular experience or logical framework which has led to that conclusion. If you are suggesting it on the basis of "because why not?" only, then the statement is potentially meaningless.

—

Now, it may be you're just not interested in this sort of discussion. But I hope you are! After all, it is literally the underlying purpose of this subreddit - experimentation and philosophical unpacking - and what distinguishes it from other LOA-type or inspirational-style "reality" subreddits. And that's why we take the time to try and steer ambiguous posts into exchanges of this sort, rather than just moderate them out immediately, etc.

We are not dealing with mainstream, majority-accepted-and-approved topics. I can only offer a door, and I do. I can only tell you of my personal experience, which doesn't appear to be what you're looking for from me. You appear to be essentially looking for 'proof' from me to convince you to 'see what I see'.

What I have been looking for, is for you to write out a description of your "core concepts" (the ones you have previously stated you came here to communicate) and the experiences which have led you to reach them, so that we can have a collaborative discussion, and explore the topic together. Since you have resisted doing that, there can be no conversation or exchange of ideas - that is, our comments are indeed going to be contentless and of no purpose whatsoever! That is the source of the frustration in this process. Belief and proof had nothing to do with it. You are amongst friends here, as regards "non mainstream" experiences and ideas; this was a good opportunity to share and to be shared with, for ourselves and for the wider subreddit audience, and to correct any misconceptions that might have arisen from the original post. So, as an alternative entry point, I gave one possible description, that you might respond to, plus two subsequent seeds for exploration. But the response was, again, essentially word salad avoidance and self-contradiction.

This leads me to conclude that I'm afraid I am not the right person to debate this with you.

Perhaps. Unfortunately, I suspect that you are simply not a person to have a debate with, at all, on this topic - but alas, experimentation and philosophical debate is the exact purpose of the subreddit!

And so we never did manage to bring your post around to being on-topic via comments. We did try though, eh? All the best, in any case.

You have asked me questions I am happy to elaborate on, but have closed your comment with "there is no discussion to be had".....I always felt this was the place for this exact discussion! But you've shot it down before we got the proper chance.

Not at all! What I actually said was:

Without being more precise, there's no discussion to be had.

Which was an encouragement to continue and expand on discussion, by clarification.

I see now that you dismiss my perspective as being "fluffy", "empty"

No, not your perspective. Your description. And not exactly: I used the "fluffy" to convey a lack of clarity, and you yourself had used the word "empty" to describe the nature of words, and I responded. Genuinely, as it stands, I found it hard to discern what you were trying to convey with your post, and how it connects to the subreddit's focus, other than just being broadly encouraging that people can achieve their desires. Your comment here isn't very easy to pin down either, I find.

I cannot control how you read my words, only how true they ring for me at that point in time.

Indeed, but we can certainly clarify what we mean, and why we mean it. So let's unpack it!

(More later.)

Thank you for choosing to open up discussion again. I look forward to your further response. :)

It never closed...

...I do find this very frustrating. I feel exactly the same about your responses, to be honest. I did reread the entire thread earlier today, and it seemed to me to be the story of two people talking past one other (despite, one assumes, equal attempts on either side to not do that). To an extent, it's a clash between different types of language (spiritual-emotional-metaphorical vs philosophical-abstract-metaphorical, perhaps, or whatever). However, that isn't entirely it. I think I have genuinely failed to communicate to you what I have been asking, and then as a result you have then answered other things or made broad statements which weren't relevant to that, or only tangentially. Regardless, the upshot is that I never really managed to pin you down in terms of clarification, in connection to the subreddit topic in terms of its focus on the nature of experience and descriptions (as direct experience and as philosophical investigation), and you no doubt didn't get to engage in the sort of exchange you prefer either. That's life on/as beach for ya, I guess!

POST: The Game (book)

For people here wanting to jump, belief is critical. It's not enough to just want or "think you can" ...but with jumping it is more forceful, powerful.

Another way to consider this, is: If "you" are not actually a person-object and "the world" isn't place, but rather you are "that which takes on the shape of" experiences, then there is no separation between you-as-experencer and your experience or state. This means that all change is direct - and this means you can't fool yourself, you have to actually hold in mind the specific pattern. That is, you can't simultaneously hold a "doubt" pattern in mind along with the "outcome" pattern, or you've intended a combination of both.

Intention & Fact Patterns

Basically, you have to intend the fact of something - rather than intend just the possibility of that fact, or intend the experience of just trying to have the fact become true, or intend maybe your act will make it come true. With no intermediary to this, the intention actually is the change to your state. Here, we have the term "intention" being the pattern you'd like to increase the contribution or "relative intensity" of in your ongoing experience; "intending" being the changing of that intensity, essentially by "becoming" the new state with that pattern incorporated. It's really just a deliberate increase of a pattern. If the intention-pattern is of the form of a "fact" or "outcome event", then that becomes "more true" in experience. If it is not of that form, then the pattern just becomes more prominent generally. In fact, this second type is a way of understanding what happens when we see whatever we are reading about somehow arise in "the world around us". Effectively, we have "patterned" ourselves, overlaid or incorporated those structures into our state as you-as-experencer or you-as-awareness, by attending to them for a while. (The Owls of Eternity exercise is of course an example of doing this deliberately.) A classic example of this is described in Philip K Dick's essay, How to Build A Universe That Doesn't Fall Apart Two Days Later.

Belief & Intentional Patterns

The word "belief" doesn't really capture this adequately, I think, because it seems to have multiple and even slightly contradictory meanings in common usage. It doesn't lend itself easily to a more technical discussion. Anyway, so, as you indicate, it's not about "thinking that you can", because that isn't an actual change - it is just the experience of "thinking" with the content of "can do this". Or alternatively it is implicit intending of a state of something "being possible", with ones own interpretation of the concept of "possibility" coming into play. To actually make a change, you have to actually either intend something to the effect "it is true now that this happens then" or "it is true now that this fact is true" (the Owls of Eternity exercise is the non-specific version of that: it is essentially the fact "it is true now that the pattern 'owls' is prominent in my experience"). Alternatively, you intend something which implies that the desired fact is true, that leverages a pre-existing fact or pattern (like the Two Glasses does).

An illustration: If, right now, you intend "the image of a red car" in your imagination, you either have the image there clearly, or you don't. You can't half-commit and get a clear image appear in experience: either you make a clear image (actually get an image of a car) or you are making some other sort of image (a blur, a mangle, or nothing). The intention can be immediate (you assert it immediately as an experience) or implied (by assuming something does the work for you, a bridging pattern concept like "the subconscious" or whatever), but it is always direct in the sense that the actual pattern you end up intensifying is the one you get, not by something else working it out on your behalf nor the outcome you just hope for while not actually intending your outcome.

Books & Reality Patterns

Anyway, there's something special about this book.

It's interesting that, in particular, quite a lot of children's books seems to lay out ideas about reality, its nature and flexibility, and in ways which are detailed enough that they don't seem to be just general fantasy fun. One example pointed out to me a while back is the Children of the Lamp series, particularly the first book, The Akhenaten Adventure. I did have links to images of the relevant pages; I'll see if I can find them later. Also, the books of Philip K Dick, the essay author above, all have an underlying "reality is loose" theme that tends to bleed into everyday experience - particularly Flow My Tears, the Policeman Said and Ubik. The upshot is, that reading extensively around a topic, whether that be in the form of fiction or non-fiction, can be a great way to adopt new frameworks and have the corresponding experiences arise in the "world around you". This, basically, is the whole idea of "active metaphors" - but with the notion that we can incorporate the intention that these patterns become prominent and therefore gain a stronger effect, rather than simply have it happen passively.

Extra bit: it is also interesting to consider that, since there is no "outside" to experience, the experience of apparently "encountering books which seem to speak about the nature of reality and then seeing their content become prominent in the world" is itself an example of a patterning of one's state.

Q1: And as soon as I replied and went back to my book, the main character encountered a large owl in a dream. Lol 😊
I had to hop back here and jot that down. As I said a noticeable spike in coincidences seems to be occurring. A ruse in novelty if you will...aka out of the background of the ordinary emerges the unique.

Hey, them owls, they do get everywhere! :-)) I've had a very owl-based few days myself, in fact. Aside - Owl events rather than owl noticings. Which I think is an important distinction to make, because it marks the difference between "seeing things that were already there" and a more definite "patterning" of experience. Of course, if you play with this for a while, it in any case quite soon becomes obvious that this is not "confirmation bias" in the sense of selecting details from a static 3D environment.

I later discovered a post with some excerpts from that The Akhenaten Adventure book, here [Excerpts from 'The Akhenaten Adventure' by PB Kerr].

I get a vague sense that there is almost a "security measure" in place, preventing all of our thoughts from expressing themselves physically

Heh, funny how Star Trek TNG spends every other episode touching on these sorts of themes, eh? It's like a reference library of analogies for these conversations. Anyway, I see it not as a "security measure" - that interpretation could be seen as an example of survivor bias? - so much as an inevitable observation one would make when in a position to be able to make it. That is, that the only world-experience that would ever get to persist in the first place, would be one where there was an "inertia" pattern as a dominant property. That's why, in general, your main strand of experience is "this world" whilst other strands are "your passing thoughts". However, you can have multiple "worlds" that do operate with the same inertia (creating "persistent realms" in lucid dreams, for example). And I'm sure you could have the experience of running them simultaneously too. As you say, though, the stumbling block is modifying the main strand "world" to make it less (but not completely) inertial - assuming, that is, one isn't satisfied with having other worlds available for all that flexible fun and leaving this one as it is. But then, if we use the "patterning" model where the world is viewed as being defined as essentially a stack of contributing "fact-patterns", wouldn't there be a fact-pattern that was the equivalent of the statement "it is true now that this world is inertial"? Would the best approach perhaps be to attend to and assert directly a change in this pattern?

I AM jumping to such-and-such dimension. I AM a powerful co-creator of my experiences. I AM able to shape and mold my world.

Right - just as you are highlighting there, if we are metaphorically-speaking "increasing the intensity of contribution of a pattern in our experience", then the pattern has to be the actual fact you want to "make true". Now, this pattern isn't actually the words, of course. We might say that the words are a "verbal aspect" of the pattern, that they are a part of the extended pattern, or that they trigger the pattern by association. The actual experience of recalling the pattern itself, though, is just as sort of objectless "knowing". And we can intend that directly, without thinking the words or an symbol, just by finding it by "feeling-knowing", and then increasing it. We do this all the time, of course. When we deliberately lift our arm, we don't say little sentences to ourselves and then trigger the arm; we simply summon the (non-verbal) fact of "it is true now that my arm lifts up then", and then the result arises within sensory experience.

From there, we also have the topic of what you might call "clean" intention. That is, intending a fact or outcome only, without also intending some sort of additional result as part of producing a "doing" experience ends up re-implying our current state. Some recent comments on that, here. Essentially, intending involves no activity at all, because apparent activities are always results (subsequent experiences in "sensory theatre"); whereas intending is a name for self-shifting and is causeless. Even with the Two Glasses exercise, our physical body movements are basically movements from nowhere, but we are distracted from this by the narrative of ourselves as "brains as body controllers" - and this is used for advantage because it in turn distracts us from the fact that we are associatively triggering established patterns such as "level strength" and "relocation transformation" and "labels==identity" and so on, to get an implied result.

I coined the phrase "is-ness" for me, reality, that place.

Yes, that all makes perfect sense. Other terms for the hypothetical "void" state might be "pure being", "clear awareness", and all that. Essentially, if all relatively true "facts" were to fade into the background so that none was more prominent in experience than another, then there's just a sort of non-spatial non-temporal openness. (I say "hypothetical" because the fact of still having some sense of observing means it is not entirely void. Similar description: here [http://www.nderf.org/Experiences/1victor_c_other.html], for example.)

POST: REALITY SHIFTING TO BRING BACK PET/LOVED ONE

From what I've learned here, the thing you would write on your second glass is more like "happiness" or "acceptance" or "fulfillment." And see how the universe helps you deal with that. You can't bring someone back from the dead unfortunately. I like to think about the "rules" like the way the Genie from Aladdin explains his wishes. You can't make anyone fall in love. You can't kill anyone. And you can't bring anyone back from the dead.

I dunno about some of that. From past reports, the love or harm of apparent others is perfectly doable, and the experience of one or other is sometimes the first realisation that there might be something to all this. That's why the instructions for the Two Glasses end with the comment "Please take this seriously and only choose a replacement situation that you will be happy to live with."

I suggest that there is no intermediary (a "universe", a "genie" type filter, or any other entity) acting as an active arbiter of what is appropriate and which prevents outcomes that aren't correct according to some independent moral code. Rather, the intentional change is conceived of as being more direct than that. The manner of obtaining results more like using a "dumb patterning system" than requesting help from an intelligence, say (you are the only intelligence). Of course, in all cases only personal experimentation can reveal the truth of the matter one way or the other. Descriptions or theories are not themselves causal; even if they seem logically self-consistent and persuasively coherent. But: I'm certainly in agreement with you that nobody should be encouraged to hope that they can, say, reintroduce the presence of someone who has died back into their ongoing experience, when there is no evidence for that in any past experiences. To encourage experimentation, even, seems likely to simply prolong the heartache and, as you suggest, you might be better pursuing a shift in the quality of life in the aftermath.

Q1: Some shamans say that is possible, they are skilled in manipulating reality, they also dont follow the common thinking (conditioning) that most peoples follow. I think that you can do theses things, because mind have not limitation, in internet you will see peoples being cautious about it because theses kind of creations are a great leap to most believe in. I exploring seeing reality like a literal dream, and i can understand why this is feared, you can do things that can make you nuts if you are not ready to see. About bring back the dead i dont know what to say, but i think is good know at least how heal yourself and others, its a good ability to have.

Right. As I say above, since the subreddit is based on confirming for oneself, nobody's going to say "you can do this" or "this is really how it is" in the manner of encouraging an unsupported belief. However, it is fine to talk about it in philosophical terms, or how one might go about it practically, and what the implications would be (basically along the lines of: the fact of the death is updated, it now never happened, the overall "landscape" of facts is pulled into accordance along with that). It's just not very sensible to give hope in desperate circumstances where, inevitably, a sure-fire-certain confirmation is being sought that something is possible. And the implication of the request is: possible, now. The honest answer is: theoretically possible in the sense that it is not contrary to some descriptions of experience, but really it can only be said to be possible if you do actually manage to create the experience. (This is of course true of all experiences really, since no experience is "pre-experienced" and confirmed ahead of time.)

Q1: I know, its a good way of thinking. What i can say is...few years ago i dont even did know that mind and reality are like the same, i did discover the secret, but i find it weak, then i start looking for another kind of possibilities, i tried Faith, i tried nond dualism etc. I then find some obscure posts in internet explaining how you and reality are the same, they are only talking hypothetically, i believed, then start trying crazy things, like trying make the weather change...and it Worked. I did tried with many thing, and it worked pratically every time, sometimes in a soft way, sometimes in Strong ways. So, i never did try make someone back to the the life, but every time i did try something new, like something that is impossible to happens, reality responded to me in some way. This is the reason why i like say that anything can be made. I i apologize if i sound rude, i am more interested in making reality maleable, and i forget sometimes that most peoples want simple things. I will talk less about that here from now:)
:)

Wasn't rude, please talk freely. It's only in response to this particular OP's request that I am (as moderator really) highlighting the usual "confirm for yourself, nobody can confirm what is possible for you" perspective, because it's a sensitive issue and it has come up a few times in the past and not always handled that well in the comments. In general, the subreddit is all about experimenting with the things you are talking about - that is, pushing against the assumptions implicit in the standard description of the world, to see if they are really true - and coming up with different ways of talking about experiences (and not accepting any description at face value). You make a good point: that mostly people have a desire, and really just want that desire to come true. They are not necessarily interested in coming to an understanding of the nature of experience, of descriptions, and so on. This subreddit does try to focus on exactly that, though, with "getting results" just being a gateway into it.

In most cases you discover that you desire a presence rather than their presence

I'm inclined to agree with this, and your suggestion that it applies to the "death" of a relationship as much as to the death of a person. It is the pattern of experience that is missed, then, in the abstract rather than the specifics of a particular instance of that pattern. And if nothing at all has changed, there will be a similar sort of outcome, perhaps.

...

AI: "I know death is no small event"
What if that is the greatest illusion of them all?

POST: Who are You?

On the broader subject of "you", check out some previous comments perhaps: here [POST: In what way are other people real?], here [POST: [THEORY] The Nature of Consciousness] and lately here [POST: People around us]. They contain various observations and metaphors and so on which might be useful.

Cherry-picking a couple of points for now: One might describe oneself as a sort of non-material "material" whose only inherent property is being-aware and which "takes on the shape of" states and experiential moments. There is no "outside" to this. Note the use of the phrase "shape of... moments" in this description. What this is emphasising, is that you are this whole moment of experience, including the apparent experience of seeming to be "over here" and the room "over there". And "the world" is not a place and you are not an object within it. The world is more like a fully-defined pattern that is "dissolved" into the background of experience - in the background of you - whose sensory aspects are unfolded and then refolded as moments. "Jumping", then, would be the amendment of that pattern, leading to a change in the content of the moments which were experienced subsequently. Meanwhile, because there is no "outside" to you, it doesn't necessarily matter how you conceive of jumping; it is the intentional change (or the implication of a change) to the pattern of experience that matters. There is no particular image or method (any method really) that is the correct one. Really, it is the assignment of meaning that counts, the accompanying intention of any act.

An exercise to try taken from one of those comments is:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

Which leads us to:

If you are the whole projection how do you create that state of mind of "I am everything and everyone" instead of I am me and outside things / people?

Well, ultimately that's just another experience, with nothing special about it particularly. So it's not necessary and it's not at a different level to any other experience. The only fundamental fact is the fact of being-aware, which means absolutely every other fact or experience exists on the level, the same level, of "as if it were true". So it's not something to get up about in terms of an enabler, I'd say. However, if you want the experience of that, here's my suggestion: you can simply sit down quietly, cease interfering with your experience (that is, allow body, thought and attention to move as they will spontaneously), and simply intend or hold the idea, nonverbally, of the pattern "it is true now that what I am is this entire sensory moment" (or your own formulation). Simply "sit with" this until a feeling of a shift happens by itself. No effort or forcing is required (and indeed this will work against you, re-implying your usual format).

Well let me tell you that in my multi-sensory experience there is a Superman who goes by the name of /u/TriumphantGeorge. Thank you... your answer is crystal clear.

Ah may I just ask... when intending and holding the idea of a pattern change, is it sufficient that you experience the new pattern as a 'feeling idea' because my mental vision is pretty much non-existent?

POST: Is it really possible to win a lottery using dimensional jumping?

Theories such as "universal balancing" and "growth potential of the whole universe" assume that there is one static "out-there" universe that everyone shares... Which I'm really starting to doubt as of late.

It also assumes that such a "universe" is organised according to what are actually fairly recent concepts, and it is implied that there is some sort of independent moral arbiter of what should happen. Another version of the "genie" entity concept, basically. Which is not to say you can't have experiences "as if" such things were true, but that is different to there being an independent structure based on them being fundamentally true.

I believe that however it is that the whole of "everything in existence" is organized (or lack thereof) at a fundamental level is doing what it does regardless of what and when humanity conceptualizes about any aspect of it.

The problem is that this is itself a conceptualisation, of course. Basically, what we're doing here is creating and exploring conceptual frameworks, and even the "meta" discussion about frameworks is also a framework (and therefore suffers from the same problem). Taking this further, that is actually happening is that in an effort to "understand" the nature of our experience, we are simply producing additional experiences which don't get "behind" anything, they are at the same "level". That is, we are generating the experience of: "thinking about experiences". Our so-called understandings are in fact "parallel constructions in thought". The upshot is, that all descriptions are to some extent "castles in the sky". They are extended metaphors with minimal observational touch-points, which need to be judged on their usefulness rather than their "truth" - because that's not what conceptual thinking produces. We must beware the "reification of abstraction", as physicist N David Mermin calls it. String theory and seeing "code" within it is a prime example of this, I'd say - I'm with George Ellis on this. Looping back to the start:

such that some underlying structure on which life is built is based on "something" fundamentally?

What we really mean here, ultimately, is: can we have experiences "as if" a particular idea is true? We almost certainly can. Does that mean that the idea is true? No. The ideas are not fundamentally true, except in the sense that it is true that there is an idea. This applies to our ongoing experience in general (the subject of this subreddit, ultimately). That is, what is true is the fact of experience. Any descriptions about experience are true as further experiences, but they are not true in terms of being "what experience really is". In fact, even the idea that there is a "how things are" and "how things work" is potentially problematic, once we dig deeper. What is reality, then? Well, this. This patterned moment right now, as experienced, with nothing "behind" it. (As an illustration of this, there's the exercise in this post to play with [Feeling Out Exercise].)

It's super-simple. Too simple in fact to be conceptualised, I'd say, because concepts inherently involve a starting with a particular property that ongoing experience does not have: that is, ongoing experience is undivided and is not "made from parts".

POST: 2 glasses method

Really, no belief is required. (What exactly is a "belief" anyway and why would it matter? We might ask.) It is in fact part of the design of the exercise that it demonstrates this isn't necessary. It's the avoidance of subsequent interference that matters. It's also not LOA, unless by that you simply mean that it operates in the same way as all experiences do, since of course all experiences have the same basic nature.

When you say, "this method is going to generally produce results by plausible if very unlikely means", how do you define/measure plausibility and likeliness?

I don't. :-)

We might ask, though. And the asking would probably lead to a different way of looking at things from the way that spawned the initial question (but define "probably" I guess). Anyway, to the actual point: I'd make a distinction here between the assessment of the "plausibility" or "likeliness" of something in advance - that is, the weighing up of possibility based on a particular description or model of "how things are" - versus how one might characterise it after the fact - that is, after one has had the experience and is reaching for a way of articulating it. In that statement, I'm using those terms in the latter sense.

POST: Can you expand your awareness after you jump and gain memories you otherwise wouldn't have?

I guess not. If you change a tv channel and you begin watching a show already half way, you are experiencing it now, but you don't know what happened previously.

Well, unless it's a marathon showing all the episodes, where you might get a "Previously, on neonledge" type segment. Or maybe there's a way to pause for a moment, introspect and check out the wiki for the show...

There's some debate on this - it probably "depends". From your own perspective, you have a history or trajectory which you remember, and may or may not agree with the observed "facts" of your present world. If you make a dramatic shift, that world starts there for you, but there is an implied history at least - which you should theoretically be able to access (or 'invent'). People who've experienced shifts spontaneously note varying degrees of urge-to-forget, conflict-of-memory, or no revised memory at all. This may be linked somewhat to intention.

My feeling is:

- If you do a shift deliberately then you will have your trajectory memories, and remain slightly separate from the world configuration you switch to.
- If you suffer an accidental large shift, you are more likely to suffer an urge-to-forget the event (if it was an experience) and 'lose yourself' in the resulting configuration.
- Minor shifts will lead to discrepancies like "Mandela Effects" but with personal relevance (e.g. people's hair a bit different, etc, not liking coffee when they used to, etc.)

There are lots on /r/Glitch_in_the_Matrix which might give you some food for thought. Overall, I'm concluding that if you do a proper directed change, then this isn't too much of a problem.

POST: ITT: Theories

There are no other selves!

Previously answered here [POST: What happens to the other-dimensional you you switch places with?], here [POST: What happens to the other you when you jump?], here [POST: What happends with the other you?]. It's an understandable question though, perhaps it needs to be put in the sidebar or (oh no) we might need an FAQ. Read the Hall of Records metaphor, for a way of visualising why this is the case. The idea is that you are shifting your experience. You are a consciousness connecting to a 1st-person perspective.

What evidence is there that this is true, though? Where did we learn this? Basically, how do we know that we're just switching our perspective, and there isn't some Other Me on the receiving end of our old life?

The quick response: What makes you think there are millions of different "You"s? And would they be "You" if they were having a different experience? And why would there be only one of each type of experience - why wouldn't there be multiple identical worlds for you to experience?

The longer answer is: You need to do a bit of contemplation and meditation to realise this. A couple of things: to realise that you "having an experience" rather than "being a person" (that you are a "conscious space"), and that the world isn't spatially-extended other than in your experience of it (there are not literally multiple physical universes out there). For directly investigating the first, you might try out this little exercise to get a feel for it for fun. But after there, you might check out Rupert Spira and his book Presence, or Greg Goode's Standing As Awareness. For the latter, philosophers such as Berkeley and Kant are worth your time.

I am changing experiences other than my own through this practice.

I know exactly what you are referring to. You truly only change "your" own experience though - however that includes your experience of other people, and of yourself. The effect is indeed "as if" there were literal dimensions (hence the naming). The trick to understanding this is that you do not live in a "simply-shared world". It's more like parallel-simultaneous-timeless dreaming. The oft-used metaphor that consensus reality is like, say, a bunch of people in a room collectively choosing the decor is incorrect. The truth is everyone has their own room, and implicitly chooses aspects of other people as well as the decor. If I had to describe it overall, I'd say it was like a personal dream, with you as the dreamer - except eventually you dream every possible aspect of yourself and everyone else. You can choose whatever experience you want, but eventually you will (or rather: already have) experience the other side of it. In actuality, it's sort of "all-at-once". This means: other people are real, but they are all you, eventually.

The Hall of Records metaphor is a way to simplify all that, but keep the key ideas in place. But... the fact is that the apparent world and apparent people do seem to change, particularly if you do an undirected approach like the mirror method. That's why I advocate more focused methods.

there absolutely are other literal dimensions and other literal "me"s.

You can have experiences consistent with that - but they are just more experiences. When you are dreaming, no matter what secrets you uncover and what discoveries you make, all you are really ever finding is... more dream.

...but my personal experiences have lead me to believe

Fancy sharing your experiences?

Certainly! You can read about my most recent jump here: [http://www.reddit.com/r/DimensionalJumping/comments/37o40v/make_sure_no_one_changes_the_lights/]

Ah. I missed that! To make a broad point: The metaphor you adopt dictates the overall pattern of the experience you get, and: if you're doing something major it pays to be specific because the result will take the easiest route. Spent time beforehand forming the intention in detail via your imagination, envisaging it exactly as if it were true now.

does this create any time-travelesque paradox, where if you did not lose a loved one, you wouldn't have had the motive to shift? it seems safe, but i'm unsure.

The "time travel version" of the Infinite Grid metaphor explicitly dodges this. No paradox, because you are always "experiencing moments" rather than "intervening via action" - in everyday life as well as in more adventurous scenarios.

i agree that i think it's safe, because i don't think you're hopping around on a singular thread, so to speak, and it could break. but your response sounds like you're dismissing free will. this seems odd because DJing is intrinsically a willful act.

You select your experiential trajectory via **will**, of course, it's just that you do not ever "physically" do anything. You just have "experiences of doing". In fact, it's this that makes free will possible - since it means intention is a filtering of experiences, a selection of a world, rather than something that occurs within a world.

POST: Just discovered this place. I have some thoughts I'd like to voice.

A good read, that. Couple of points:

- Yeah, inherently you can only prove these things to yourself. Even if you convince others, that can just be part of the effect. One of the things this stuff reveals to you is that you do not live in a "simply-shared world". In some ways, you are totally alone. In another way, you are everywhere - but we're getting a bit metaphysical now.
- In terms of "multiverses", if you follow this through what you end up with is more like "all variations can be experienced in consciousness". The overall result in terms of personal experience is kinda the same, but it does mean the analogy is more like "a conscious being watching a particular TV channel" (in super-surround-sensory-3D) rather than "your consciousness shifting from inside one brain to inside another brain".

I find the Imagination Room metaphor quite a useful way to envisage this situation. (Although the more accurate metaphor would use something like "a holographic space in which all possible experiences are dissolved", imagining that there are patterns on the floor is a nice visual way to bring this to life.)

...If this stuff even just makes people explore their ideas more thoroughly, it's a good thing!

EDIT: Slight repetition below. Sorry: lost track of which thread I was replying to!

Something to ponder: things don't necessarily exist in the form that we experience them in the senses. For example, recall what you had for dinner yesterday. See it, smell it, taste it. Now, where was that recall experience before you brought it into your imagination? Was it stored somewhere in the same form (spatial, temporal and multi-sensory) as that experience? Consider: was it "dissolved into the background" of your current experience all along, just waiting to be triggered and intensified - like a holographic image, sort of everywhere and nowhere? Could all possible experiences be present in this way, awaiting "recall"?

Perhaps the present sensory experience is like the sun in the daytime sky. All the stars are there, but concealed by the sun's brightness. What if you could choose which of the "stars" would be "the sun" tomorrow?

POST: Second update, noticed a lot of small changes, even a few with this sub

basically there are no correct or wrong metaphors

Exactly. However, the metaphors you adopt implicitly or explicitly will format your experience; your experiences will start lining up with them. This is true of any pattern your trigger: they amount defining the facts that future observations will remain consistent with; they amount to a pattern which is "overlaid" over your life. I shy away from the word "belief" though, because that has a fuzzy meaning, including ideas like "opinion". If we stick to something like "formatting" we are closer to the truth. I mean, would you say you "believe" in time and space and colour and cause-effect?

I can now understand why man created the idea of god and why he worships it.

Because we cannot experience ourselves doing anything - in other words, if intending means to change the shape of ourselves, we can only see the results, and so cannot conceive of our willing - we in ignorance ascribe cause to parts of experience. We feel muscular tension and call that "doing" when body movements arise, or we associate "this thought" with "next thought" and label that as cause, but when other things happen that cannot be so obviously linked, we try to find somewhere else to hang it - hence the invention of an "entity god". Having a god becomes a metaphor you can call upon to be the "cause" of the changes you are doing.

Stable ground

Although what you are is all of the world, it's beneficial to declare one part of it "you" and therefore hold that part stable. Otherwise the whole thing can shift all over the place, and there will be no persistence, because there will be nothing for the rest of the world to hang from. Traditionally, this is the "ego" concept coupled with a small physical sensation or tension which is maintained - but if you choose your identity as the "background space within which experience arises" then you get the best of all worlds. You are not letting everything collapse into void, but you are also not constraining the evolution of the world-pattern.

I feel we all need to be one with our subconscious.

We always are, really. Reusing a metaphor: the whole world-pattern is right here, being experienced by you right now. It's just that some parts are brighter than others at a given moment, like the daytime sun obscuring the other stars in the sky. What we call shifting our attention is actually different stars having their turn at being the brightest.

EDIT: Which is why we don't need to deliberately focus our attention; that makes us feel that we are one tiny part by over-intensifying one aspect - deforming it with intentional change. Your "being one with the subconscious" would translate as letting attention open and expand?

How do I change my formatting? How do I decide? Is it a sort of feeling?

That's what this stuff is all about really. Detaching totally (basically: release the patterns) and intend-will-decide-summoning how you want it to be. Unfortunately, because of its nature (changing the shape of oneself), we can't describe how to intend; we simply do so, as "first cause". In general, you want to get relaxed and "allowing" such that summoning an image, etc, is completely effortless. There should be no pushing or tension involved in intending; it's more of a "releasing" or "letting happen".

"To intend is to wish without wishing, to do without doing. There is no technique for intending. One intends through usage."
-- Carlos Castaneda, The Art of Dreaming

Something to ponder: How we think about something is that something. For example, if you think about tomorrow, the pattern that appears is actually tomorrow. It doesn't represent tomorrow; it really is the idea-aspect of tomorrow. Same with anything else you pull up from the background into sensory experience. So long as you are "calling it up", rather than just messing with imagery without intention, you are actually pulling up the actual thing from the "world-pattern".

POST: Problem with the original story

The general answer is: because when changes happen to you, you can still remember how it was before, so you can tell the story. Otherwise of course nobody would ever know of changes happening, since the world and their memory would remain in step (which may actually be the case sometimes).

I don't know. It seems like there should only be 2 options: The kid doesn't remember his old dimension's father or he's contaminating the new dimension that doesn't have an abusive father with slander; In other words - we should be getting the story from the perspective of this dimension's story creator - not the kid who left the bad dimension!

That doesn't make sense. So, the summary is that a kid had an abusive father and he jumped to a dimension where his father is not abusive. Naturally, the only record of this is in the memories of the kid and anyone who experience the change with him. The kid who did the jump is the author of the change and the story is from his perspective. Are you saying that the story should not be told? And are you suggesting that saying "my Dad was abusive in another dimension, but he's a nice guy in this one" is slander? Because I don't think Other Dimension Dad will be suing anyone for defamation... interdimensional law sounds tricky! :-)

I'm assuming he never told the story to his current nice Dad. But maybe I'm misunderstanding. What do you mean by "contamination" here?

The story should be told from the perspective of the kid who had his body stolen about how the mirror took his body somehow. Any recollection of having a bad father wouldn't exist since this dimension's story teller only knows of a good father. Why would this dimension's story teller all of the sudden start saying his father used to be abusive when that never happened - hence why he left?! Any memory of the bad situation would be contamination in this dimension - the story would not be told from the perspective of

the mirror version of the author.

Okay, I see what you are trying to say: That from your perspective some kid just suddenly says his Dad used to be abusive but isn't anymore. So for the moment let's put aside the "jumping" metaphor and approach this another way. Now, there is only one dimension/world:

- Imagine that I sat an exam last week, and got a low grade.
- I now decide to cast a "spell" so that I got a good grade. The world is "updated" so that I now did well in the exam. The world has been shifted so that in effect this has always been true; there is not trace of the old state of the world, except in my memory.
- If I tell people about this, it will be as if I suddenly say "hey I failed the exam but now I have passed". As far as they are concerned, I had always passed.

This is what was happening with the kid. But wait, what if someone else is wishing that I failed and the same time as I wished I passed? It doesn't matter, because:

- Everyone has their own copy of the world.

You can have any experience you want, including updating the world's facts and history. The "other people" you see are just images of other people, the versions of them that correspond to your current intentions (aspects of their Extended Person). Meanwhile, sensations and perceptions and thoughts of "yourself" are a version of "you" that corresponds to your current intentions. What you actually are, it turns out, is the "conscious space" in which your experiences appear - the experiences of yourself, other people, and the world. Our experiences do overlap with other spaces but in a non-simple way that can't be explained easily, because it is "before time and space" (and unfortunately we can only conceptualise in terms of moving parts arranged in mental space). I've copy-pasted a comment from elsewhere which tries to explain this a bit more, kinda based on the Imagination Room metaphor:

On The "Sharing Model" Of The World

You are not a person, you are a conscious space having a "person-perspective experience" - senses, perceptions, thoughts, floating in awareness. The "person" you are might be considered as The First Tulpa. Meanwhile, it is just not possible to conceive in thought of the way in which there is overlap between apparent perspectives. It is not a "simply-shared" world model. The other people in your experience are your aspects of those people - and the "you" you experience is similarly an aspect of that idea. Often people talk about a "consensus reality" as if it's a bunch of people in a room, choosing the decor together. In fact, it's more like everyone has their own room, choosing versions of the other people and the decor. In fact, it's even more like everyone is a room, and is choosing versions of themselves and other people and the decor. In fact again, not even a room because the room represents time and space, which are themselves "contextual formatting" within you... you get the idea...

And "idea" is the key word. People are "ideas" or patterns, and it is those ideas which appear in your experience. "You" are just an idea you have associated with yourself. However, even a little bit of self-examination reveals that you are more like the stuff that worlds are made of...

In the future, people should set up their dimension jumping stories like this:

That's not quite right though. It's all about perspectives. From the kid's perspective (who is telling the story) the story is actually:

- "I always had a problem with my father being abusive to me. Then one day I looked in the mirror and had a really weird experience. It felt like I was somehow swapping places with the reflection in the mirror. After that experience my father was a nice guy. But what's even more strange - it was **as if the world had changed** so that he had always been a nice guy. Nobody remembered him ever having been a bad guy! It was as if I'd shifted to a new dimension where my father had always been a good parent."

Dimensional jumping stories can only be told from the perspective of the person who makes the jump, or perhaps with people who deliberately jumped as a group (see the Multidimensional Magick post for a comment on this: it amounts to "deciding" that you will have the experience of sharing the jump results.)

Of course, the methods suggested in the sticky tell you to say "swap" to trade places with the mirror person so you're giving the person who once had a good father an abusive one. How interdimensionally selfish, right?!

Haha, yes. But the swapping places thing is a metaphor. There is no "other you" out there who is getting a bad deal. What you are doing is switching from one experience to another. If you have a green car and decide to paint it red, that doesn't mean that some other person is forced to paint his nice red car green!

EDIT: It occurs to me you might be thinking from the perspective of "a dimension" or a "god's-eye" perspective of all dimensions, but there is no such thing. There is only the perspectives of particular subjective consciousnesses. All experiences and all stories are 1st-person-view.

POST: Schrödinger's cat and a new way of looking at "Dimensional Jumping"

Good read!

So what if our own expectations were enough to "lock" the state in place. I.e. if we were in our minds completely sure that the cat had to be alive

This is pretty much the idea of "false observations" behind descriptions such as All Thoughts Are Facts: It makes no difference whether an "observation" is supposedly internal or external, since they arise in the same perceptual space. What matters is in the intensity of the contribution. And anything you can conceive of can potentially be "observed" in this way, so all possibilities are here, now - just like you say. Basically: we cheat. If the world is defined by a series of observations (Observation Accumulation) and all observations must be consistent with previous observations (Law of Coherence), then:

- The only rule is that the apparent world remains self-consistent as an entire pattern. [1]
- If you "force" an observation using deliberate imagination, it will have as much contribution as a "spontaneous" observation.
- If a forced observation is about the past then subsequent observations will contribute as if it were an observation in the past.

And "Jumping" is the allowing your experience to be shifted as a whole (detaching) by inserting an observation that corresponds to what you want, while allowing the whole pattern to shift to accommodate it.

I think many cases of "jumping" are merely an effect similar to hypnosis, NLP

NLP and hypnosis is pretty close to jumping in some ways? Manipulation of the contents of mind. It's just that in this case we are accessing the world-pattern in mind rather than the personal-pattern. Although the distinction is sometimes hard to make.

how people can come back here and claim to have jumped, without seeming to have left?

I think that jumps are on a continuum in terms of apparent localisation of effect and the extent to which we still seem to share the world. You can have quite drastic changes and still have a reddit conversation here, because it's not a complete shift to an entirely different state; it's a modification of your state to a greater or lesser extent. The whole "world-sharing" aspect of reality is pretty impenetrable anyway, though.

[1] If you fancy a relevant slog through some related comments to that, there's this post about the "delayed choice experiment" and this comment was an early attempt to describe pattern-shifting in that context.

...Hey, that's the trick though isn't it? :-)

We can think of lots of interesting ways that "overlap" might take place, but we can never experience the actual overlapping process, so it will always remain an abstract notion - with us imagining how overlapping might work. Which is a problem, because: If your imagination dictates the content of our experience (the basis of jumping), then it also dictates the types of overlapping which can occur. This means that we select which aspects of other "private views" to incorporate into our own. Which means we can't distinguished between allowing content overlap from other views, and just simply dictating content. Every model fudges the objective reality part (P2P networks, QBism, etc)

of how subjective views might overlap, because inherently the overlap would occur outside of the concepts of space of time. This makes it literally unthinkable, and hence meaningless. So I tend to take my working model as the world being a shared resource (of patterns) rather than a shared environment (spatially-extended world). Of course, this still leaves us with the option to imagine that we are co-creating, and have an experience which corresponds to that. For the fun of it.

EDIT: There is a notion that when we are "in overlap" with other perspectives, then we share a trajectory together, and that is the experience of "love" and connection. That's what differentiates the background people (nothing is looking through those eyes) and the close people (other perspectives experiencing it). That still suffers from the same problem of differentiation though; it's just a commitment to a particular "knowing".

if we are consciously directing our experience, then maybe even our memories are tied in to what locks us in our current state

Yes, because if memories are parts of the current "world-pattern" then they are contributing, shaping present moment experience. They are "facts" which current observations must be consistent with. If you bring up a memory (which is to say, ask for one and then it appears in mind) and edit it, there is no trace other than that, and it would be "as if" true going forward. The trick, I'd say, is that you have to be careful whether you are editing "the world's memory" or a personal memory.

merge with the consciousness of the businessman you, bring it back here, and accept that your prior "inserted memories" are now no longer inserted memories but actual memories.

Sounds like an approach. In fact, I think the "keep a diary of how your ideal would be" has been used to switch mindset. A bit like Neville Goddard's The Pruning Shears of Revision plus a switch. I wonder whether it wouldn't be better to go straight for the desire though, without bothering with the updating, since what you want is a discontinuous switch anyway? But it could be a way to run in parallel or something.

I think it's part of the reason visualisation alone is so powerful, but beer . . .

Rule #1 of the universe: Beer is always more powerful than visualisation! :-)

Q1: I've used this framework for years, and it's extremely effective (look for retro psychokinesis in my post history). I think it's an idea which time has come. You got me thinking: I always thought that once you observed something, you set in stone whatever outcome you observed. It figures then that your reality had fewer and fewer options as time goes on. But jumpers say you can change what has already happened. Strangely, this fact just only hit me. And this is a total game changer.

Yeah, it's the total game changer!

Have you read Neville Goddard's essay on The Pruning Shears of Revision? Detach from the old observation, amend it or create a new observation to replace it, is the summary. Multiply that up and and you realise that the apparent past doesn't matter much. What matters is the observations you make now. The extreme version would be to detach completely from the current experience, kick off a new strand of thought, let it become immersive, and then never return to the old strand...

What happens is, it resolves itself. You don't focus on the sensation, you don't narrow your attention, you let it stay open and wide and just allow the fear to be there. After a while it becomes stronger (but really it always was that strength, it's just that you were averting yourself from it) and then at that point it kind of expands into being nothing. If you take a step forward and then try to stop the movement, then you are left there with tense muscles and maintaining an off-balance position. The more you aver your attention the worse it gets. The only way to solve it is to allow the postural pattern to "follow through" and complete itself. This will involve temporarily having a strong experience, but that's necessarily part of the movement and release.

Q3: Using what I mentioned above, I like to think of things as such: once we've observed/ascertained a thing to be so, the related things required for it to have happened, the event itself, etc, are all "set in place" and certain. However that doesn't mean they can't be set back to uncertainty, and I believe no matter how firmly in place it is, it can be changed with an equal amount of effort.
The reason this is important is you'll find that it's VERY easy to make something happen the way you want (whether via this or via other methods) if there's already some uncertainty about it. A lot of people assume that means that's all you can do, but the fact of the matter is you just need to work out those prior beliefs and dissolve your framework back into a state of uncertainty before proceeding with inserting a new outcome. :)
Just my 2c :)
Edit: Someone gave me a really nice way of looking at it a while back. They asked me to think back to all those silly cartoons you'd watch as a kid where say a statue would start moving and stop moving whenever the main character turned around to look at it. My friend said to think of the universe in a similar way, at its core, the universe contains all of the infinite possibilities of people, states, objects, interactions, occurring simultaneously forever, but when an observer of any kind looks at it from a limited perspective it takes on their beliefs and assumptions about how it must behave and "freezes" into place with all the variables required to fit what they expect to see. That'd fit why a state of non-duality/unity with the infinite only ever comes exactly when we stop seeking and lose all expectations about what we are to experience, and shed our observer perspective completely.

I love the statue analogy!

Going off track a bit, Jesus, I think the biblical notion of "forgiveness" means something closer to "forgetting and letting shift" than saying sorry, which means the parables are describing that exact thing: allowing your previous observations to sink back into the gloom so that they no longer limit your next observations. That previously-activated pattern fades away because it is no longer being re-triggered by association. It's basically saying: yeah, what I saw before was true then but that doesn't mean it has to be true now. Those statues could be anywhere; they needn't be permanent "pillars of salt" unless I constantly look back to check their state. Neville Goddard like his statues too, being a big fan of Blake's “Sculptures of Los’s Halls”, which is a metaphor for eternal states. So it's like "letting your statues move", but it's also like shifting to a state in which your shadows are arranged in accordance with a different blueprint.

TriumphantGeorge Compendium - Part 8

POST: I have attempted dimensional jumping twice now.

I think you're trying to do something quite dramatic without having really done the groundwork. Have you checked out the "related posts" in the sticky post?

You're trying to do something like a "reset", it sounds like.

...Actually, replied to the wrong post, sorry. Although the sticky links still apply. See my other response!...Then skip the mirror approach, go for something like the Neville Goddard version with a specific aim in mind (literally!)...Completely relax and detach, summon the corresponding imagery, maintain immersive focus until it becomes the dominant part of experience. Like direct-entry lucid dreaming, with coming back being optional, perhaps.....Yeah, don't try that standing up. Lie down, eyes closed, enter a relaxed state, then relaxed-focus on your target, allowing imagery and sensations to arise. What you're really asking for here is for one 3D-immersive thought to supersede another.

Just quickly...

Another example of a change was that a scar on your friend's arm has disappeared, or new buildings have appeared. But really, your just noticing for the first time.

Yes, **noticing** is nice way to put it. But we must understand that the environment in which we do the noticing has (I hate to say this but let's go with it) "higher dimensionality" than we usually assume.

Definition:

To "notice" something is to bring into perception something that was already there, but had not yet been experienced in sensory space.

The way in which something is "there but not yet experienced" is the important part. Specifically, we are not dealing with a 3D spatially-extended world which we explore - even though that is how it usually appears, so quick are we to "fill in the gaps" as we go. If we suddenly notice a book on our bookshelf which we haven't seen before, was that book always there? Yes, in some way. However, in order to see it we had to adjust our angle to the world. So, the effect can be both mundane and continuous, or dramatic and discontinuous, depending. For your main post questions, you should check out the last couple of edit links in the Neville Goddard post. For "jumping back in time" there have been people who've reported experiences "resets" of a sort (/u/MemoryEchoes and various glitch reports), it's not something I've wanted to do myself so I can't comment. However, the principle is the same no matter what: you are seeking to allow one 3D-immersive strand of thought fade and another one brighten and take its place. In any case, you could do worse than start doing the exercises described in this comment [POST: [AMA Request] TriumphantGeorge].

Yeah, I've had to explain to three people so far that you can't literally change dimensions. People are saying to try jumping to a slightly better dimension, like for example one in which you have an extra \$50 in your wallet. I don't understand how people think that you can really change dimensions just like that, but I guess if your superstitious you could fall for it since there's nothing to clarify the subreddit' purpose.

Indeed! There's no such thing as a "dimension" other than as a concept. Mind you, there's no such thing as "space" or "time" other than as concepts either (they are bad habits). You can't literally change dimension, but you can't literally move in (conceptual) time or space either. What you can do is leverage concepts to trigger a change in ongoing experience, in perhaps surprising ways. I don't think this subreddit actually has a purpose other than supporting personal experimentation into the limits of how experience can be changed. It doesn't even have a worldview other than maybe "experience = fact, results = truth". That's why the sidebar isn't prescriptive. **So don't feel obligated to take on the burden of explaining things to people**, I reckon; **it's for them to explore the world on their own terms** I think! In my own view, people shouldn't actually "believe" anything - including anything about themselves. Until we do an experiment, we don't know anything, we are just recycling thoughts.

POST: Need help with intended goal

As someone else said, Neville Goddard is full of good examples. Although unfortunately his language makes for obscure reading. Generally I'd concentrate on what you want rather than the mechanism. Do you actually want to go back in time, or do you want to join the armed forces without that incident being a problem? Surely it's the second!

Think: what's the actual experience you want to have, if it were happening around you now, that would mean you would have got what you wanted?

Random example:

Yesterday morning's mail brought me one, where, in San Francisco, this captain, a pilot, and he writes me that I saw him backstage after one of my meetings, and there he said, "But Neville, you are up against a stone wall. I am a trained pilot; I have gone all over the world, all over the seven seas; I'm a good pilot and I love the sea, not a thing in this world I want to do but go to sea; yet they restrict me to certain waters because of seniority. No matter what argument I give them the Union is adamant and they have closed the book on my request." I said, "I don't care what they have done, you are transferring the power that rightfully belongs to God, which is your own imagination, to the shadow you cast upon the screen of space.
"So here, we are in this room; need it remain a room? Can't you use your imagination to call this abridge. This is now a bridge and I am a guest on the bridge of your ship, and you are not in waters restricted by the Union; you are in waters that you desire to sail your ship. Now close your eyes and feel the rhythm of the ocean and feel with me and commune with me and tell me of your joy in first proving this principle. and secondly in being at sea where you want to be. He is now in Vancouver on a ship bringing a load of lumber down to Panama. He has a complete list that will take him through the year what this man has to do. He is going into waters legitimately that the Union said he could not go. This doesn't dispense with unions, but it does not put anyone in our place- -no one, kings, queens, presidents, generals, we take no one and enthrone him and put him beyond the power that rightfully belongs to God. So I will not violate the law but things will open that I will never devise.
-- Awakened Imagination, Neville Goddard

See the "letters example" in that document for what you might actually do, to focus your mind on what you want to achieve.

POST: Seriously, has anyone used this for romantic/hedonistic pursuits?

Oh look, is it...? Yes, it is...! It's that guy! ;-)

Well, the same applies to this as to everything else. Doing the Goddard type thing, the usual approach is that you come up with an experience (imagined 3d-immersively from a subjective point of view) that means things are working out well, and live from it. You could do that with celebrities and, taking it seriously, you could well end up with chance meetings and opportunities to get what you wanted (random job offer in LA, invited to a party, actress is there). Y'know, but most people don't really want those things, they wouldn't really commit to it, or follow through. Anyway, top tip because you don't want everyone to be your puppet: Think of everyone as if they are an "aspect of you" and so your ultimate aim is that everyone should be happy in the world. Because a world full of happy people is a happy world for you to be in. So when you, say, create "fake observations" in your mind that mean you and girl had a great time, the focus is on how great it is for both of you. (For instance, your "scene" might be talking to a friend at a cafe and talking about "what a great time she and I had together" rather than "I totally had that girl last night".)

Q1: Haha. Yeah I think it is about time I read on Mr. Goddard's books. Does the Power of Awareness suffice? Or is there more I could also expand on?
Ah I see. So it also helps that I help imagine a non-ego oriented imagining? Take it from her side of it too? Can one expand to what other people would observe, say those who would be watching us at the cafe?

There's nothing to it really, but yeah, check out that or the ones in the edit in the relevant post for a quick take. Just imagine it from your perspective, through your eyes, being there. What I was getting at is that the circumstances you are implying should be ones where everyone is happy and independently for the situation - i.e. that you and the girl were on the same wavelength, it's an equal situation, with no apparent manipulation or one-sidedness. Just as you'd like it to be, of course.

POST: Just stumbled accross this sub. Questions...

What proof is there of anything subjective except anecdotal? The only proof is to try something out, and satisfy yourself that either: a) there's something in it or, b) there isn't. A good comparison would be: lucid dreaming, or satori. They sound apparently unlikely, but if you actually pursue them you discover that apparent unlikeliness is no barrier to experience.

Well, dreams are probably not a very good example because almost everyone has dreams, we know that dreams are impulses in our brains, and we can control conscious thought so the stretch to controlling dreams isn't that far fetched. Satori seems like such a vague concept that trying to use it as an example doesn't strengthen the argument.

To be clear: I'm not making an argument, so I'm not intending to strengthen one. There is no argument that can be made for the existence of an experience.

However, lucid dreams are not a bad example, since it was argued very strongly for a long time that one could not be conscious within a dream. In retrospect we can say things like "we can control our thoughts so it makes sense we can control our dreams", but it was vehemently opposed at the time. Those who claimed the experience were dismissed, based on the theory of dreams at the time. (Although to this day we don't know what dreams are or indeed why we sleep at all. And "impulses in our brains" is not an explanation.)

Similarly, although satori is of course a vague concept, it is a concrete experience. It just cannot be captured in language; it cannot be described to someone who has not had the direct experience; it also cannot be anticipated from within a conceptual framework. So what I'm getting at here is: in general, you cannot use logic to make a judgement on the possibility of a novel subjective experience, you can only use it to explore a conceptual framework. Inevitably, without a novel intervention from outside of that framework, logic and argument lead you to the same actions, and hence to more of the same experiences. At best, you can use it to decide you don't care to know for certain one way or the other, that you aren't interested in exploring anything that has not already got a fully-developed narrative available for it.

From elsewhere:

My own guidelines are: experiences are real experiences; explanations are useful narratives. We must be careful not to treat the concepts we invent as actual things, even when they seem to work really well. Our observations are what define our stories, our stories don't define what it is possible to observe. That's why we should welcome different ideas, because fragments of them might be useful later on.

TriumphantGeorge, I think we have a negative nancy here. He is scared. It's cute. Do it or don't. What do you want? A perfect life? That is not this subreddit. If he finds one. We'll never know, now will we?

If we're being fair, his post does seem to present an open but skeptical mind, which is a good stance to take. And I think a lot of people, unknowingly, want to be sure there is an explanation in place for something before they allow themselves to try (not realising that science or any avenue of study has always been based on the idea that observations take priority over theories). So perhaps he should be scared - because absolutely anything could potentially happen! ;-)

Q1: No shunning here, friend. I'm just going to say that all "logic" is subjective and basically amounts to theory... that includes modern science (which is more a less an ever evolving belief system). And quite honestly, the more you really dig at the heart of any matter, you will find that damn near everything is anecdotal. Not sure what proof you're really looking for. The best way for you to prove it for yourself is to give it a heart-felt try and see if works for you. That's the only way you're going to know.

Q2: Glad to see level headed responses. Think this whole thing is a bit too philosophical for me but I agree, when it comes down to it everything 'known' is really just believed. I'll leave you guys be and who knows, maybe even see you on the other side. :)

Yeah, something like "applied philosophy/metaphysics" is probably not a bad summary of what this is about. Anyway, welcome anytime. Watch out for the owls...

POST: How my mother used the Just Decide Technique and got the result she wanted in 20 days.

Yeah, it's fun eh?

The more you do this stuff, the more you'll find that "other people" are telling you how they are doing it too...

It's not solipsism or co-creation though. Solipsism implies that you are the only person. But really you are not even a person. Co-creation implies that there are multiple contributors to your perspective, but this is not the case. Actually, you are the whole world (or at least: a version of the whole world is in you-as-consciousness) but are looking out from one apparent perspective. The "other people" and "you-as-person" are aspects of this world, parts of its continuous pattern, all arising within your consciousness. But what about multiplicity? Multiple conscious beings having their own experiences? Is there no overlap?

We tend to think that the world is shared in a simple way: like a spatial environment that is unfolding in time, such that we are all seeing the same place at the same time. But it's more like every being is a conscious space, selecting into themselves the patterns they like from a "toy box" which contains all the possible experiences of being-a-person-in-a-world. That way, every being can be having a different experience and be overlapping, albeit indirectly.

(In truth, when you follow this to the end, consciousness is indistinguishable so there's only one consciousness, with a multiplicity of experiences which cannot be described because it is "before" time and space. Unfortunately though, because our thinking is of a 'shadow-sensory' form, we end up having to use spatial and temporal metaphors to talk about it.)

Anyway, the final result is still that: you have control over your own "private copy" because you choose, explicitly or implicitly, what set of patterns you have triggered into brightness, what facts-of-the-world you are allowing to contribution to your ongoing experience.

EDIT: Fixed paragraphs, changed phrases, reformatted for clarity.

I've covered it a bit elsewhere - see the above comment as an example - but let's go with this, and see where you would agree and where you wouldn't.

It'll be a bit of a ramble but - onwards... EDIT: Sorry, it really was.

Parts and Relations

The truth is there is no way to talk about this in language. Immediately when we try to talk or think about this, we have to invoke a spatial metaphor, because to think of something we have to have a concept consisting of parts, and arrange those parts relative to one another. But consciousness doesn't have parts - or spatial extent or temporal relationship - those are aspects of an experience. So as soon as we conceptualise this situation, we're wrong. Because the thinking of it is a structured experience, and this is "before" experience. It is evident from direct introspection that consciousness has no properties of itself; there can be no "two" consciousness(es). We can come up with a label "consciousness" and imagine that there are parts which are related to one another, but they are not. That's just a diagram in our mind. No matter how we approach this, it's incorrect. Conscious spaces do not exist in anything since there is no outside, because it is "before" division; and there is only one or actually not even, because it is "before" multiplicity.

Again: it is literally not possible to think about this. It cannot be represented, because it is that which takes on the shape of experiences, and representations are just more experiences. However, we can use a metaphor which at least breaks some of the usual assumptions, and so...

Sharing without Space and Time

In an attempt to avoid using time and space as the framework in which we relate perspectives, I use this picture:

- The world is not a "spatially-extended place unfolding in time". We are not people sharing an environment.
- We are "that which has experiences", basically conscious spaces which take on the shape of the experience we are having.
- There is no temporal or spatial relationship between conscious spaces.
- Instead, the world can be thought of as a collection of all possible patterns. It is more like a shared resource than a place.
- So the sense in which we "overlap" is in the format of the experiences we have; the shared subset of patterns.
- This means that our ongoing experience is more like the associative traversal of a memory block. It's a strand of thought about being a person in a world - rather than actually being a person in a world.

When you tie this up with the fact there is only one consciousness, that the conscious space you are right now is the only one there is, that the has no boundaries and there is nothing else, you realise there is no outside of this. However, although there is no "outside", there can be a very detailed "inside". The relationship we can potentially talk about is shared patterns, even though we cannot talk about relations in a time or space context. Right now you are "God" of this copy of the world - and so is everyone else of their copies - and they don't clash! So this is not solipsism because it is not personal and "everyone else" is in the same situation (or one consciousness is in lots of situations, whatever).

Why Bother?

Why bother with all this? If it wasn't required we wouldn't bother, and most people can just ignore it. But...

If you experiment a little, the fact is that **your world does not behave like a co-created place**. You can wake up tomorrow and everything has shifted, including people you know, and it will "always have been that way". Facts can completely change and "always have been that way". Your world actually behaves as if it is one continuous pattern - your pattern, dissolved in consciousness - which includes the apparent properties of "you-as-person" and "other people", a pattern that **responds to your intention in an unrestricted manner**. So this gives us a way to conceptualise that, while avoiding misleading metaphors. It's not like "private views" are a new idea of course - QBism, as a recent example, uses it to describe the subjectivity of quantum physics. The tricky step is realising that there is no objective world - no CPU - that links or synchronises the subjective worlds, and that in effect there is just one subjective experienter.

TL;DR: Solipsism is actually meaningless in this context. The world is best thought of as a resource, rather than a place.

Is it possible for there to be a concept such as 1+1=2, that exists before experience?

They exist purely within experience. You can use such abstractions to create a narrative about experience (within experience), but it is meaningless to say they exist "before" experience. (I use "before" in quotes because, of course, there is no such thing.)

What I mean by within experience -

It's tempting to think of the bright 3D-immersive sensory element (a "scene") in experience to be "the world" and somehow everything else is behind the scenes - but there is no behind the scenes. It's all present but dissolved, being experienced now. Metaphor: like the sun in the daytime sky, where the stars are still there but obscured; it's a matter of relative brightness. Layers of patterns, some of which are shining through into prominence. So we do end up with a situation where our experience is "formatted" and structured, depending on what level of prominence certain patterns have, and hence our narratives within experience will also be so-formatted. (The senses, objects separation, spatial extent, all arise-with particular scenes, for instance.) And at the limit, we might imagine that the format of narrative approaches the more simple patterns of experience. But that again is part of experience and it is only "about" partitioned experiencing; the narrative cannot accurately describe the formatting.

Meanwhile, things like the global background felt-sense, which could be said to be the direct experience of the current state, can't be given that narrative. And of course "unformatted consciousness" itself - which was what we were focusing on before - cannot be conceptualised at all. You can only be it.

To summarise -

- Mathematical concepts are within experience (being thoughts, this is so by definition), and any "formatting" to which it refers is part of experience too.
- It's the "sandbox" problem. You can make shapes in the sand which represent other shapes in the sand, but you cannot make a shape which represents sand or the sandbox itself.

EDIT: Relinking: I like this N. David Mermin article on reification of abstractions, although it's a bit physicsy for some. It's good at marking out the difference between (direct) experience and narrative, in the context of creating and using theories.

*Q2: Every act of magic that get a result follows the same template:
Decide what result you want Equate an act, any act, with the result Perform the act Get result
You don't need to enter into any fancy state of mind. Forgetting about the working does help. It's so incredibly easy and simple that people usually tend to complicate it to no end.*

It's true you don't need to enter a state of mind - any declaration of fact, explicit or implicit, has effect - but the more 'surrendered' you are, the more completely things can shift, and the more efficiently the result can appear. Which is why metaphors are useful; they provide "plausible paths" for things to arise that are beyond the norm. But yes, it's super-simple. Unfortunately it inherently doesn't "make sense" though (it's "before" conceptual frameworks), so people generally need some sort of outlook to hang it on. So long as you choose a very flexible and abstract one, it's okay.

The dimensional jumping idea in itself is extremely interesting because it breaks you out of causality even more, since things that already are can become different.

Yes, you’ve totally nailed this - that’s exactly the point of it.

Pretty much every other methodology makes the assumption that what I call Observation Accumulation is irreversible. In other words, that new observations must always be consistent with prior observations - so that the world always “makes sense”. That you can only shift parts of the world-pattern that you haven't "seen" yet, because the parts you have seen are now "defined". However, this is an overstatement of the Law of Coherence - which in fact only states that the world-pattern must be self-consistent at any particular moment (which follows because it is a single continuous pattern). It doesn’t say that the next moment-state necessarily needs to be consistent with all previous moment-states. So: the world-pattern can shift as a whole and coherence is still fulfilled. Dimensional jumping and its metaphors say that there are no external laws enforcing the persistence of prior observations; the basic version of the Law of Coherence is the only law that applies. Established facts don't change because... you don't allow them to or you don't even make the attempt. Anyway, this means that we can assert things in order to:

- Effectively “re-observe” prior observations and correct the associated “facts”.
- Create new "fake" observations and have them count as “facts”.

And the world-pattern will shift coherently, meaning that all subsequent observations will be consistent with its new state. The main problem for people is that committing to this involves throwing away (or better: just not thinking about) their usual way of conceiving of the world: it is no longer a "spatially-extended place unfolding in time" that we all share; it's a "shared resource" of possible patterns that we individually select and trigger into our conscious perspectives, as a "private view".

....

Can someone explain this method?

It's what's underneath everything: declaring that something is a fact, and the world unfolds "as if" that were true.

(Taking the mother's perspective:) In this case, his mother - believing in a "soul" - sends it out to do her work for her. Implicitly, she has decided that performing that act means-that her situation will be resolved. Her world shifts accordingly. This works in the same way as the Two Glasses Exercise works by implicitly deciding (asserting) that transferring the water shifts the state. By making that decision, you are literally connecting the situation to the water, and by pouring it you are literally updating your world.

...

What did that mean order your soul? What exactly did she do?

I imagine she just said, "soul, go out and sort things out for me!". Subsequently, she had an experience "as if" such a thing existed, and that it sorted things out.

POST: Relationship of D Jumping to the Law of Attraction

Well basically everything is based on the same thing. The law of attraction is pretty much just a very unstructured way of trying to use patterning to make changes; it doesn't have much of a metaphor or philosophy underlying it other than the vague concept of "attraction" (which I'd say actually gets in the way of a good description).

Like all things of that ilk it roughly boils down to:

- detachment
- mental/physical act + intention = state modification
- subsequent appearance in sensory experience

But the devil's in the details. The underlying concept of this subreddit is, it's recognised that the implicit or explicit adoption of a metaphor is itself a formatting of experience; metaphors are "active". And this is because all of experience arises from a patterning of consciousness (see: philosophical idealism, nondualism). Importantly, this means we can arbitrarily assign meaning to things and have experiences arise "as if" it were the case. None of this necessarily matters in order to use a technique to get some result, but formatting yourself with an appropriate metaphor in effect defines new "plausible paths" by which results can occur - and it also gives you the possibility of "knowing what you are doing". The confusion associated with LOA is because it has no solid framework. In /r/DimensionalJumping, we realise that frameworks are arbitrary. We take a super-flexible, low-level one ("patterning") as the basic foundation. Everything beyond that can be chosen according to usefulness and elegance, as the situation dictates.

See: The Patterning of Experience and the other key posts listed in the sticky.

POST: Musings about the nature of reality

EDIT: This is a bit meandering too. Still, why not eh? Be good to kick off some discussion. Usual caveat: add an imaginary "as I think of it..." in front of everything.

Making changes to our own 'reality' must affect 'source.'

That's a nice phrase. It points out something vital: you don't change your experience by messing around with it on its own terms. You don't move your arm by messing around with your body sensations; you do so by intending a new position. You don't change your circumstances by wrestling with your sensory imagery; you do so by asserting a change in some way.

On the other stuff...

Dimensions, Moments, 'Reality'

So, I think it's probably important to emphasise that you can use any model you want (and I like some of the imagery you used there), but it's also important to emphasise that none of them are "how it is really". Even in quite fundamental ways, such as the idea that there is a continuous space, that time unfolds, other than your experiencing of it. At least not in the way that you experience it. The fundamental truth it is: there is nothing "happening" other than the experience you're having now, in the way that you are having it. This is literally unthinkable though. However, realising this can save us wrestling with trying to "work it all out" - that is the equivalent of trying to see the bottom of a pool by splashing the water. Then we are free to use whatever attracts us.

Patterns like the Infinite Grid are useful because they break the notion that you are a body, in a world that is a "spatially-extended place unfolding in time", giving you a taste of the "true" situation, but still give you a fun structure to play with. But of course, you can just as well take on the idea that you are a body walking around in a 3D-world which behaves like a very flexible dream, responding to your intentions. It's a case of: whatever works, whatever you like. But none of it is "true" in a deep sense, at the "source". There are no dimensions, worlds, paranormal entities, all that, in a deeper sense. All experience is, in effect, "imagined" or recalled from a large resource of possible thoughts.

The true situation is, traditionally speaking:

- There is The Absolute, which has no divisions and never changes. Everything is in it and yet it is nothing (like all possible shapes are there, but presently balanced by their opposite, which are of course also there). It is All Creation. This is what is real about your experience: this is reality.
- There is The Relative, this is where one shape is emphasised relative to another, resulting in the apparent existence of objects and of change. This is what is illusory about your experience. This is often referred to as a "projection", to capture the idea of a movie projector (The Absolute, containing all frames) and a screen (The Relative, the display or emphasising one frame at a time).
- The two are one and the same thing. Nothing is ever created, it is only emphasised. All relative content is an illusion.

That's where things like The Imagination Room come from: an emphasis that there is nothing other than your "perceptual space" emphasising different shapes versus others. In a way, it's like the "world is a dream" metaphor but with a bit more structure. But practically speaking, and for enjoyment, just operating as (say) a conscious space with patterns dissolved in it is not particularly exciting. It's something to know, and flexibility is something to know, but that is meant to be freeing, rather than a new sort of burden.

But what does this say about manipulating reality?

Well, reality can't be manipulated; it's already been created in its entirety and it never changes. All we can do is select from it. But this is great, because it means if we can think something, then it already "exists", and it can be brought into experience in some way. I say "some way" because, inevitably, to transition from one state to another, requires you to let go of things as they are now. To get to a standing position you have to let go of being-sat-down. To get to other states, you might have to let go of your usual notions of time, or your ideas about cause and effect, other people, and so on. You might not always like the idea of doing that. That's the "price" you pay. In effect - if you ponder it - the more extreme the change, the more you have to let go of your humanity a little, and of the idea of your world being a "place" rather than just a series of images within consciousness.

Why is there not just always instant change? Why are there apparent collateral changes?

Because you are not completely 'fresh'. Metaphorically speaking, you have layers and layers of patterns activated right now, which are structuring your ongoing experience. None of the "facts" of your world-pattern (the selected aspects of The Absolute that are contributing to your Relative experience) stand alone; they only have meaning due to their entanglement with all their associations. Even your concept of "people" and of "memory", of the idea that there is a stable "past", all operate as drags on how your intentions eventually become visible in experience. They contribute from the moment you have them, but are immediately entangled with all that other stuff, and they only "shine though" when an appropriate context becomes available; when the clouds part briefly. Meditation and releasing and detachment are about letting the clouds dissipate, for faster results. But all this is a good thing. Would you really want to have an existence which literally consists of your thoughts immediately persisting as 3D-immersive environments, as your "reality"? Basically, a dream with absolutely no inertia?

The 'sluggishness' that we experience in certain directions is a benefit more than it is an obstacle. For example, our experience tends to be continuous and make logical

sense, and the things we done so far tend to persist rather than need constantly reactivated.

POST: Philosophy and Dimensional Jumping

It's not a bad line of thought, that. Although the underlying philosophy is probably more based on Berkeley, Kant plus non-dualism, those lack a well-defined notion of choice and freedom which Sartre provides. If we take his "in-itself" and "of-itself" and see them as one and the same, and his "radical freedom" as therefore applying to experiencing itself rather than the given content, then that's definitely one way to look at it. (With apologies for rustiness and maybe slightly misusing terms.)

As a separate thing: I do think that philosophy can sometimes lead to complex ways to circle around "that which cannot be described" without ever getting there (fair enough: because we're trying to describe "the thing that experiences and descriptions are made from"), so although I love it, I've kind of stepped back from it more recently - thinking that in the end simpler models, ones which can be adopted as immersive metaphors and more easily tested out subjectively, are probably better for actually making progress "in real life".

EDIT: But of course, without the philosophy to start with, you can't make the models!

Q1: When you say "in-itself" and "of-itself" are you referring to Kant's "a-priori" and "a-posteriori" distinctions? This always reminded me of the Platonic theory of forms (the reality of the form versus its mere appearance - very Brahma/Maya here IMHO). I'm sure that it is much more nuanced than I have articulated it.

That's Sartre-speak, but I pretty much believe that all of these strands of philosophy were an attempt to capture the same thing (which make sense right?). Mostly, wrestling with the idea that The Absolute takes on the shape of The Relative, and they are one and the same - like a blanket of material whose only property is "awareness" experiencing folds within itself. (The "patterning model" I use here sometimes is another version of the same: eternal patterns which vary only in their relative intensity, their "brightness" dictating how much each contributes to experience, the overall distribution constituting a "world".)

I like to think of it like Moire fringes. If all possible patterns are latent in the background (a blanket of material which can take on any shape), then triggering one pattern, "A" (a set of folds in the blanket), and then triggering another pattern, "B", doesn't take up any more space - you still end up with "a pattern", "C". You've still got exactly the same material shaped into a single pattern, just a more complex set of folds.

...

Good note. Hinduism is rich in stories which point to the fundamental (awareness/being/experiencing) vs relative truth (content/state/dimensions), and they're much clearer than the Christian parables. Favourite:

Narada, Vishnu and Maya
*In Devi Bhagwata Purana, it is mentioned that once Narada asked Vishnu about the secret nature of Maya (Illusion).
“What is Maya?” asked Narada.
“The world is my Maya. He who accepts this, realizes me,” said Vishnu.
“Before I explain, will you fetch me some water?” requested the Lord pointing to a river.
Narada did as he was told. But on his way back, he saw a beautiful woman. Smitten by her beauty, he begged the woman to marry him. She agreed.
Narada built a house for his wife on the banks of the river. She bore him many children. Loved by his wife, adored by his sons and daughters, Narada forgot all about his mission to fetch water for Vishnu.
In time, Narada’s children had children of their own. Surrounded by his grandchildren, Narada felt happy and secure. Nothing could go wrong.
Suddenly, dark clouds enveloped the sky. There was thunder, lightning, and rain. The river overflowed, broke its banks and washed away Narada’s house, drowning everyone he loved, everything he possessed. Narada himself was swept away by the river.
“Help, help. Somebody please help me,” he cried. Vishnu immediately stretched out his hand and pulled Narada out of the water.
Back in Vaikuntha, Vishnu asked, “Where is my water?”
“How can you be so remorseless? How can you ask me for water when I have lost my entire family?”
Vishnu smiled. “Calm down, Narada. Tell me, where did your family come from? From Me. I am the only reality, the only entity in the cosmos that is eternal and unchanging. Everything else is an illusion – a mirage, constantly slipping out of one’s grasp.”
“You, my greatest devotee, knew that. Yet, enchanted by the pleasures of worldly life, you forgot all about me. You deluded yourself into believing that your world and your life were all that mattered and nothing else was of any consequence. As per your perspective, the material world was infallible, invulnerable, perfect. That is Maya.”
Thus Vishnu dispelled Narada’s illusion, bringing him back to the realm of reality and making him comprehend the power of Maya over man.*

...Great eh? Now look around the room you are in, and realise your true situation at this very moment...

...

It's quite nice, isn't it? It brings you back to the simplicity of actual experience, rather than the tangle that thoughts about it can become. When it comes to searching esoteric texts for explanations, my general advice is: don't. You just end up in a synchronicity whirlwind, because every path you take apparently opens up a right seam of connections and evidence. But really: there are no deep underlying reasons for experiences. What I'd do if you've had a complicated experience - put it aside for a week, leave it alone. Then, after that, right down what you literally experienced, stripped of any interpretations or explanations. Literally: I saw this, then this happened, then that happened. And take it from there. Who knows what insights you might uncover for yourself? Please don't interpret me as being dismissive on that score. You will likely uncover things which are subjectively meaningful, within yourself. However, I think you can't go wrong with standing back and starting with a basic account of the observations, as it were, before doing the interpretation or model-building.

Random thoughts -

My own position is that experiential content is just that: content. It only has meaning relative to itself, and it has no fundamental meaning. The metaphysical truth is content-independent. And the fundamental truth is known only by direct experience, and cannot be conceptualised at all. Experiences are just experiences, no matter how amazing. Their benefit is that they point to the arbitrariness of the content of experience. If things shift and change a lot, eventually you twig that: hey, all that ever happens is more dream! It never ends, and I never really get any deeper into it. Every door opened generates a new landscape, every dig uncovers more fossils, every time I go looking for an explanation, I find one... plus more questions. It goes on forever, so The Answer can't be within the content of experience.

...Well, I keep good company apparently! But there's no good way to say it, really, although I do think modern metaphorical language can offer more streamlined descriptions because we've got access to a richer set of abstractions (or so it seems to us, anyway). Mathematics is the ultimate language for describing abstract relationships - i.e. patterns - for instance. Shapes without substrates, objects which don't take up any space and be simultaneously existent and non-existent, in perfect balance. Etc.

...Do it. The reason it got removed was because: a) it was very hard to follow and, b) it didn't seem to be about an intentional shift, which is what this subreddit is really about. (There are other subreddits for reporting spontaneous strange experiences.)

As I say in the other comment, if I were you I'd not bother with the research right now, not until you've settled out a bit - you'll just end up with a whole load of self-referencing synchronicities. Take some time out from it, then return to it with a fresh mind.

POST: Is it possible to jump without using any of the techniques?

All the "techniques" take the form of performing a mental or physical "act" with the intention that it means-that something is true (a fact, or a future situation). There actually is no technique for intending; one simply asserts, but that's impossible to describe and you can't "try" to do it, so the misdirection of an act is helpful. Practically speaking, there's probably always something that can be interpreted as an "act". Meanwhile, the majority of people are constantly re-asserting their current state. For instance, most

people continually re-trigger their current physical position, which is why movement has a sense of effort or overcoming a hurdle: they are simultaneously intending being-sat-downl and being-stood-up, for example. This is why some trick which leads to "detachment" is included. So you can indeed apply the formula directly, without a technique:

- Act + Intention + Detachment = Shift
- Assigning a meaning to an act is what gives it causal power.
- Assigning a meaning to any experience can give it causal power.

In your case, the "focus on my belief system" will be the act, and the "change that I want" would be the intention. As with the owls exercise you will get some results simply by focusing on your belief system (the pattern activation will make it contribute to your experience more prominently), but having the deliberate intention with it will make the difference. And you have to complete the bargain (as it were) by surrendering to whatever shifts arise.

Basically: experiment.

Could you please elaborate on what you mean by detachment?

In general terms: ceasing to oppose spontaneous movements in the world / allowing shifts to occur without interference. To give you a direct example right now:

READ: If you're sat down, pause a moment, and let go of your attention, let yourself become aware of the background space in your body and in the room around you. Now, just "decide' that you are going to stand up, but don't do anything deliberate about it. Let whatever's going to happen, happen, and be okay with it.

NOW DO IT BEFORE CONTINUING.

What happened? Did your body stand up "by itself"? Or did you feel something happening and you halted it? Or did you feel yourself sitting "more intensely" than before, and no standing?

I felt something akin to the urge to stand up, or the expectation of me standing up shortly, but I never made it there. Is it possible this is what's holding me back? How might I get better at it?

It's not so much you get better at it - there's nothing to get better at in terms of the intending side - but you stop obstructing it. What you are probably doing is continually asserting and re-triggering your current state as the starting point for a movement. Take a moment to try this out and see if it make sense. Sit down somewhere again, and this time you are going to get up as you normally do, but paying attention to what actually happens. Stand up. Did you do this by shifting your mind to the state of being-stood-up and your body followed, or did you in fact begin by "finding your body" - basically, looking for the being-sat-down state - and then beginning from that point?

Two things to play with:

1. Taking this phrase in mind: "release into the movement", try intending standing again.
2. Centre your attention in your forehead, withdrawing your "presence" from the rest of your body (this prevents you triggering states). Try intending standing again.

Once you've had the experience, it all makes more sense, the whole "states" thing and so on.

Would a deprivation chamber be considered, in your opinion, lack of re-assertion of a current state? You wouldn't really have the Act+Intention+Detachment=Shift paradigm at work, though perhaps Detachment may be entailed. Or am I completely misunderstanding? Thanks.

It's a possible route, but having done floaty tanks ages ago (although before developing this view) I don't think it's necessarily any better than lying on the floor and giving up your attention. You can be in a tank and still be held onto, if not your body arrangement, then still the sensation of location and world. Isolation from input isn't the problem, it's an attentional thing. There's also an issue that you are not necessarily fully supported, in the sense that you are on the floor. The water accommodates your distribution of muscular tension, because it doesn't imposed any particular position on your. If you like down in the constructive rest position, then gravity imposes a release and your body, mind, attention feels more comfortable with releasing.

Having said that, floating is very pleasant and it's probably a great environment to experiment. I keep meaning to go back to it.

POST: i only just read about dimensional jumping. is this stuff real ?

Well, it's not the sci-fi type concept that you might be thinking about (although "other realms are available"). But let's just say that your apparent world is a little more "flexible" than you might have assumed, and isn't of the same form you have probably assumed. Maybe start off by creating some owls, then do the The Glasses Exercise, just to convince yourself there's "something going on", and take it from there.

I see it as occultism for people who don't actually want to put the mental effort into occultism.

I dunno, at its best I'd say it's more like the "Reality 101" lesson that nobody got given at school. It's how stuff works anyway; you're just noticing what you've been doing accidentally all along. Many occultists seem to have swapped one hardline worldview for another, too busy pissing around with the content of experience to have spent time getting to grips with what the nature of experience is. (Chaos magick looked interesting at one point, but it got bogged down in its own ideas about "beliefs", and never really fulfilled its initial promise I think.) I think the deeper ideas in this subreddit have the potential to connect these two things together, while avoiding the arrogance and snobbery that plagues the followers of other approaches.

I do however believe that alternate realities do exist and that eventually when technology permits, we might actually be able to jump and record events in other realities.

I have to say, I don't think that will ever happen, in an objective way, if you're imagining something like portals opening and people walking between places - unless you're thinking of Contact (you have an experience and come back, but physically you went nowhere and there's no trace in "this" reality). I don't think realities are "places" at all really, except (using the bad metaphor) in the sense that a video game environment is a "place".

Until an actual physicist comes out and proves or even explain how something like this could be possible...

That kinda misses the point though, maybe?

The whole underlying basis of this sort of thing is the nature of observation itself. It's more a metaphysical or philosophical issue (the nature of consciousness and our experiences of the world) than a scientific one (observing regularities in the content of our experiences of the world and building models). You can only do subjective experiments on the subjective experience, not objective ones. Science is "inside" subjective experience; you can't really do objective experiments on it. Although maybe theories like QBism might one day provide a framework to use to describe subjective viewpoints. (QBism says, in effect, we each have a "private view" of reality.)

[Excuse length, but I think it's worth spending time trying to clarify this, and see if we can reach an agreement in this area.]

Sciencing the Shit Out Of Reality

I agree with this, but then if something can't actually be recorded and measured, how do you know you are really experiencing it?

You are "really experiencing" everything that you experience - it's your interpretation of it that's up for grabs. But interpretations are essentially connective fictions anyway...

We have to be careful here: many popular science enthusiasts have reversed the idea in their thinking of what lies behind the process. In science, observations are primary; they are the only thing that is "real". The conceptual frameworks that we use to link those observations, are constructed narratives.

- Observations dictate what models are valid.

- Models do not dictate what observations are valid.

Science does not seek to find what is true. It's basically an endeavour to find useful descriptions which have predictive power. As a result, it limits itself to:

- Observed regularities - i.e. subjectively experienced patterns which noticeably repeat and are relatively easy to distinguish.
- Observations which leave a trace which can itself be repeatedly observed later, by multiple observers.
- Observations which can be captured as descriptions - in practice, this restricts us to visual observations as the end result.

And there is further filtering:

- Observations which can be defined in terms of presently available conceptual frameworks - this has narrowing effect, and can lead people to take the view that if something doesn't fall within the current framework, it is not "possible".
- Observations which be intersubjectively agreed upon - this has the effect of being lowest common denominator, in the sense that any observer-dependent aspects of reality are filtered out. By definition, only the most basic common aspects of the world experience can be included.

All together, this means that science does not deal with reality or the world as it is or that which is experienced - it's dealing with a very specific subset and for a very specific purpose. Science's purpose is calculation rather than understanding or meaning. It is very good at that - but it's important not to confuse it with "how things work or what things are".

Experiencing vs Really Experiencing

And so, returning to your question:

if something can't actually be recorded and measured, how do you know you are really experiencing it?

You know you are experiencing it, because you are experiencing it - it is directly and immediately true. In fact, observations are the only things that ever truly "happen". On the other hand, you cannot know if you have experienced something in the past. Mainly because there is no such thing as "the past". All you can ever do is have an experience, now, of a shadow-sensory object that you call "a memory". This applies even to what you see around you in the world. It is an act of "narrative faith" to assume the world is stable, and that external records are trustworthy as regards indicating a thing we call the past. That we tend to trust the "world's memory" more than our "personal memory" - even though both are merely present moment subjective experiences which arise in your mind which, upon investigation, basically come from "nowhere" - is a matter of convention and hope, and not much more.

The Mandela Effect & Friends

Well, let me be upfront and say I'm not a particular fan of the discussions which hang off that whole Berents#in Bears thing. As you rightly point out, practically speaking it would be very difficult to discern whether one's "personal memory" has shifted, or if the "world memory" has shifted. All you can be certain of, is that there is a discrepancy between the two. And since it's already happened, there's no much point in theorising about the cause. Nothing is "more likely" than another thing, if you can't test it. We are really just saying "seems more plausible to me", which is different. If you wanted to truly test for certain whether there is some sort of effect, you would have to attempt to bring it about deliberately, and observe the results. In short, you would have to perform an experiment.

Subjective Experimentation

I really don't think a human could DJ without some kind of technology involved, its all made up but its still neat to read.

So, the way to find out whether that was true or not, would be to conduct an experiment and see what effects arose, right?

However, the in-built problem with this would be that you might only ever be able to prove it to yourself. The very nature of an experiment where you attempt to shift your experience of reality, would be that it might not be open to intersubjective study. Of particular difficulty is that it's inherently the case that there is no mechanism to study. If the whole of reality shifts a little, then there is no "one part" which cab be observed pushing against "another part". The end result is always going to be of the form:

- Perform some mental or physical act.
- Observe whether the world as it is now, differs from the world as it was (as I recall it).

But such a change in the world takes the form:

- World Memory $\neq$ Personal Memory

It is never possible to tell whether the World Memory changed state such that it's now as I desired it to be, or if my Personal Memory changed state such that it seems that the world shifted towards my desire. However... That doesn't matter, practically speaking.

Thinking More About Doing

In terms of not believing that thought (really: intention) can shift the world, you might try raising your arm. Then really pay attention to what you experiencing happening when you do this. How, exactly, do you change the position of your arm? (Really do this, it's quite informative.)

Do you feel yourself "using your brain" to do it? How did people lift their arms before brains were discovered?

In fact: aren't brains actually just a subjective observation? In other words, doesn't it seem that brains are inside experience, and they do not cause it? If I had a lucid dream where I was being operated on, and surgeons were prodding my brain and then my arm was moving - in what sense would my experience of seeing the surgeons' actions be linked to my subsequent experience of arm movement?

You get the idea.

POST: I think that it is possible to jump dimensions without knowing it for a long time, if ever.

If we were to take the view that our experiences consist entirely of "aspects of ourselves", this would mean that every time we had a change of state the (apparent) world would shift a little. "Jumping" is then just a knowingly deliberate and specific version of something that is in fact happening constantly, to some extent. Ponders: if we are always in effect exploring our own minds, what does it mean to "make our minds up"?

That is interesting. Do you then think that it is possible that we have the power to shape reality, albeit subconsciously? It seems unlikely, but perhaps it is possible.

It's an important question, and one that can't really be answered by thinking it out, I'd say. Since reality for us is our experiences - any theories we have are also experiences (of thinking) - it's not like we can ever get outside of it and do experiments on it; there is no "outside" to experience. So I think all you can do is conduct personal experiments, and see how your experience of the world changes as a result, and infer things from that. Really, that's what this subreddit is about. Other places discuss the philosophy of experience (/r/onierosophy) or report spontaneous unusual experiences (/r/glitch_in_the_matrix), here the idea is that you don't believe anything in particular, you explore things for yourself by deliberate, direct experimentation and see what happens. The overarching concept is that is that of "active metaphors", which is to say that the metaphors you adopt tend to shape your experiences "as if" they were true, and soften the paths of change in that direction. It is a "content agnostic" view, which says there is no fundamental truth, there is just experiences "as if" things were true. How far can that go? Well, finding that out is the source of the adventure!

That's where things like the Two Glasses Exercise come in: simple ways to check for yourself whether an apparently non-causal change can be made, by pattern shifting alone.

Q1: About a week ago I noticed that there was a path of bricks across a grass lawn at the local university that I don't think was there, but I very well could have just not noticed it until now.

Heh. That is what you are supposed to think. These things just sneak into reality. I have an entire city reshaping itself (or being reshaped) all around me. Land sort of just grows when you are not looking, but it comes with a history. Roads widen, shrubberies show up, etc. Campuses are especially suspect for me. Also look for roads which used to be straight but are now crooked and signs of places where the ground has risen.

It is true, things do apparently "sneak". However, I would recommend that people be reasonably mindful when it comes to this: when we step back and allow things to autofill with less direction, it does become more dreamlike, but with that there's a temptation people have to think that it is being done or managed externally. This becomes a self-fulfilling path, generating "as if" evidence for itself, that gets some people into trouble; they got lost in it for a while. Fortunately it doesn't take much experimentation to realise that it's a "dumb" patterning process, effectively an "autocomplete" using currently active elements, that can be directed by intention.

Some of it is automatic. Some of it is being intentionally manipulated.

Uh-huh, right. And recognising the intentional part, doing it knowingly, is what's important (and makes it clearer, though experience, the nature of the experience more generally). Oh, I did mean to say, that I like this wording very much:

Land sort of just grows when you are not looking, but it comes with a history.

I'd maybe tweak it up to say: "but it comes with an apparent history" - which is revealed in subsequent experiences "about" its past, although these experience take place in the ongoing present.

Yeah. That is actually really important. It turns out that the present is not caused by the past. Rather, whatever present you are in at any given moment causes its own past.

You might phrase it as: the story is discovered as you go along, at the moment of discovery, implied by the current patterns.

For example, (0) a new tree appears in my garden. (1) I go to examine it, it seems large and old. (2) I ask the neighbours about it, it's always been there, they say, and rumour has it the tree was planted by the guy who built the house. (3) I look up old photographs of the house, and there's one of the original owner planting it. It seems like I've moved to a "new reality" where a tree has been there for 100 years. In actual fact, this history is 'created', observation by observation, as I uncover it: observations 1, 2, 3. First, there was just one observation 0, the new tree. That was the only change. However, my subsequent observations must be coherent with what came before, hence the apparent history I uncover, as the observations accumulate. In other words, there was no defined history until I went looking for it.

...

...Well, if it that's a narrative that you enjoy and find meaningful, then you're right to pursue it. (And I'd apply that view to everyone. "There are no answers, only choices.")

Personally though - inevitably our perspectives will differ here, but that is of course part of the fun - I don't think "space-time" needs healed, because it is not a thing. There is an argument for helping people "heal" though, in terms of resolving difficulties and so on (from which improvements in "space-time" generally follow).

...

A1: What is reality? Is it a piece of paper? Fold it. What is reality? Is it clay? Shape it. You have the ability to form reality around you, you do it all the time. Every action has an equal and opposite reaction. Every time you touch the water, a wave will form. Touch life with the intent to shape the wave you want to see.

"Go shape yourself!"

POST: Has anyone noticed BIG changes? Changes that can't really be explained away because they are too BIG?

Perhaps the trick with so-called dimensional jumping is to retain your memory after a particular jump?

Keeping one bit of the world fixed, while the rest changes. Really, we never experience "the past", right? Rather, we just have observations (discoveries and thoughts) which are "about" the past, which imply a history but are not a history. Basically, anything other than what we directly observe is a fictional narrative that connects the dots. The past exists as a story, not as a place as such.

There's a lot of established science and common sense saying that this is "all in our heads".

Although they don't go far enough, perhaps. It really is in our heads - all of it, not just any quirky observations that don't match. Plot Twist - Our heads are in our heads too. But at same time we, don't really have a head, so much as a "head" - i.e. all of our heads are conceptual.

Funny, that; you've just described my concept of God and the universe.

Well, that's pretty much where we get to, isn't it? Quite excitingly, I think. Right this very moment, you can easily notice that what you actually experience yourself being, is a "big open unbounded space that is aware". Within this space, sensations and perceptions arise: your body and the world. Meanwhile, all possible experiences are "dissolve into the background" of this space: the universe. So "the universe" becomes all the content dissolved inside you. You-as-the-space are "God". It just so happens that right now you are "taking on the shape of" a particular experience, which is being-a-person-in-the-world. (More accurately: being-a-universe-from-the-perspective-of-a-person.)

The main step forward, I say, is to stop confusing the current content of experience with the true nature of experiencing. Does that fit in with your take on things?

Q1: Had a vision, once. Pretty ordinary circumstances: hanging out in my then-apartment with a friend, smoked about half a joint which to me was about the equivalent of drinking a Pepsi in terms of effect, and suddenly saw Everything. Needless to say, I can't "remember" it, couldn't even at the time, because what I perceived was way too "big" to be contained in the handful of meat I use as a brain. But I had the sense of infinite conduits, pathways, going in infinite directions and tangling in exquisite chaos, and things zipping along those pathways in seemingly no order whatsoever, all of it forming a great pattern that, regardless of the apparent chaos, made absolute sense (from a Different Point Of View) and, just generally speaking, held the connotation of positive intent. And I could sit around all day and analyze and dissect this, but in the end, the underlying impression - that there is a Reason and a Purpose, and that it is generally Good - is really all I need to be going on with, until whatever time I hit level cap and head on Home. As close as I can figure it, the Meaning Of Life is simply to live, and to write the best story I can with my life, to play the best possible game according to whatever rules I choose to play by, to learn something from it all and have the best time I can. S'good enough for me.

And I could sit around all day and analyze and dissect this, but...

That's the thing with direct knowledge, right enough. All that I'd add is that purpose (with a small "p") is pretty adjustable; Purpose (capital "p") is a bit different, but it's a matter of perspective. We are not any particular thing, I think, but we can be, for a while, and we can go with that or not - curiosity would tend to dictate going along with it, mostly.

But that's sort of the point. We all have goals, objectives, rules we live by and things we want to accomplish... that's part of the point of being human. But from that different perspective - from the outside looking in - the things we think of as rules and the things we think of as important are meaningless. The true Purpose is one we can't know or understand from the perspective of meat-bodies.

Well, the real issue is that you can't tell whether the apparent "True Purpose" is just another bit of patterning, right?

If you "surrender" you'll soon find that your body, mind and world move spontaneously by themselves, as if along a pre-made path. However, it is not necessarily true that this is purposeful in some greater sense. It tends to give you situations that result in an unwinding of accumulate baggage, but if you tackle that directly then you circumvent this, and it changes. If you change yourself (re-pattern the world), or specifically intend some experiences, your direction and "Purpose" shifts also. I think it would be a

mistake for people to (for instance) live their life according to "God's Plan" as if it were given to them from, or defined from, outside. "God's Plan" seems to me to be the spontaneous unfolding of the current condition you are in, towards a state of resolution, within the boundaries of certain restrictions - the very restrictions that this subreddit discusses temporarily suspending to allow for faster change, in fact. To say we can't understand or know our current path, is just to say that we don't experience moments that we are not currently experiencing within a 3D-immersive perspective. That doesn't mean it is "special" or fixed, it just means it is not habitually seen (although as you point out, it can be perceived metaphorically sometimes). It is not "destined" in the same way as being our true fate; it is just the path that deterministically follows from our current state. That sense of "it's so perfect" that we get when you perceive this, is the perception of total logical coherence, not of "the way". Change the state, change the path - perfection will persist, the experience of it will shift. "The Way" is the manner in which we follow the path, not the path itself, which is totally arbitrary and flexible. But (except for what I just said) if someone feels they are on a mission or have a greater purpose, I wouldn't dissuade them of it; it's probably not a bad way to live out your days.

Yeah, see, you're... not getting what I'm saying. Which is fine, of course. Everyone has a different perspective on the universe, and all are equally accurate. But, see, even mentioning "God's Plan" as a point of reference is a null term, because we are God, and "the Plan" is both non-singular and as sensible to the human meat brain as two plus four equals watermelon.

Maybe not! Let's try though. Rip this apart:

Okay, I used "God's Plan" in quotes because, yes, we are God in any meaningful sense of the term. What I was trying to say is that there's nothing special about a particular plan, and that even if I don't consciously know the path, it is nevertheless a result of all the intentions I have had, knowingly and unknowably, gradually unwinding. Forgetting about brains for the moment, this is simply a matter of perspective, wouldn't you agree?

As I walk over to the fridge to grab a beer, my attention is on the music playing in the other room - I even forget that I'm going to the kitchen to get a drink. Soon enough, the song ends, and I find I'm back in my chair, looking at this screen. The intention to have a beer in my hand at the computer was fulfilled, even though I forgot the plan. Even though I wasn't aware of the movements happening; even though I never have known the details of how some of those movements work. So, if the universe is your body, then its movement is like that. It shifts towards fulfilling your intentions, like a pattern shifting between states. Usually my attention is only on one 3D slice of it (this particular body and a region around it), but that is just a matter of focused attention rather than not being able to sense it potentially. If I widen my attention out, I see more of my "body", perhaps 4D and the "current plan" becomes clear. But the plan changes every time I create a deliberate intention. The so-called plan is really just "the 4D pattern as it is right now". It's no plan at all, really, because it was never "planned".

TL;DR: The plan isn't a plan; we are not humans; it's all about 3D vs 4D attention and experience.

*Q1: I guess that falls into what I'm saying... sorta...
Then again, we're trying to discuss concepts with a language wholly unsuited for it, so "approximate" agreement is pretty noteworthy in itself.
But the whole Plan/Purpose thing that I've talked about... the Purpose isn't even anything we can know or follow. It's beyond/outside any and all human beings, so there's no way our perspective can expand enough to make it make sense. I guess it'd be closer to say "the underlying mechanics of how the universe works", because the "how" and the "why" are all part of the same thing.
But yeah, everything, everything is a matter of perspective. It's one of those Profound Universal Truths that manifests itself in such little mundane ways that the human mind doesn't quite snap to the fact that yo, dude, this is Important Shit right here. Funny, that: we can literally trick ourselves into seeing wizards and hobbits in normal-sized men using a bit of trickery of perspective, and yet overall we humans still don't get the importance of perspective. See a thing from one perspective and it's an inexplicable tangle; change your perspective, and it all falls into place.
Meanwhile, we're still bound to this universe by the languages we speak, all of which discuss being "next" to something, or above it, beside it, around it, looking up from below, looking down from above, all different perspectives, but so limiting that we - translating the universe through the languages we speak - never see that there are other perspectives as well, that go outside what we think of as "spatial awareness".*

Yes indeed, verbal language is problematic - in fact, anything that results in thoughts about a topic (i.e. any sort of communication) is problematic. You can never really describe an experience, mostly you trigger a conceptual structure, occasionally you can use language to lead someone to a subjective immersive experience, but you can only do it in person, responding to cues.

...the Purpose isn't even anything we can know or follow.

Then in what way can it be said to exist? ;-)

Although I imagine I know what you're getting at, since you used the phrase "the underlying mechanics of how the universe works". The main problem is that the universe doesn't really "work" or "happen" in any particular way. There is no "process" or "mechanism" involved. As I occasionally say: thinking so leads us to focus on the content of experience, rather than the nature of experiencing. I suggest: We can examine content all we want, looking for secrets or explanation or purpose, and we might even find things that satisfy us for a while, until eventually we realise that it's just... **more dream**.

The fundamental reality is "what dreams are made from" rather than any one dream itself. The word "purpose" tends to imply an end-state, an ultimate goal - but there isn't one. We might say that the goal is to realise (not understand) the nature of content - and then probably forget about it. Have some adventures. Then remember again. It doesn't matter whether you take the 3D or 4D or the dimensionless background as your perspective; the content itself doesn't matter. If you have the "dimensionless" experience, you do directly sense that everything is static and eternal - and that daily life is like exploring a pre-existing memory block, recalling it moment by moment - so I suppose there is a benefit to that. The benefit it is: the search for enlightenment via experiencing ceases, and you realise the "purpose" is simply being. Resolution and progress is just the gradual dissolving of division, and there is no meaning in that, just as there is no meaning to the settling of the surface of a pool of water after it has been disturbed by a child throwing stones at a duck...

From the perspective of the Power outside "all of this", which our human meat-brains cannot understand.

Well, I'd put aside the meat-brain thing; you've never experienced one of those either. But what you're talking about, really, is faith that there is a Power external to you, right? One that has an independent intelligence and does things? I would disagree with this. (Because I don't think anything "happens" other than attention, in a specific sense of the term.)

...this could not have occurred in any universe I know or understand.

Uh-huh, but (and of course I don't know the details here) these things tend to only be a problem or amazing if you are holding onto the idea that there is stable world, sitting on a solid persistent substrate, that is external to your experience. This is not the case.

this is the universe's way of telling me that I'm on the right track.

The universe can't tell you anything. I say: it is a mistake to interpret the universe as "sending you signs" of being on the right path or whatever. All your experiences simply conform to your current "patterning". Correlations between the thoughts you have and what you sensorily encounter are common but seem amazing; but they arise from the same place and space. You can easily prove this to yourself by adopting a different frame of mind or narrative, and noticing how the world quickly seems to adopt the form of the "game" you have chosen. People who adopt the worldview of 'secret spies are everywhere and out to get me" will literally encounter a higher frequency dark-suited men happening to look in their direction while talking to their lapels. Others who adopt that of "there is an independent God who is looking out for me and sends me messages" encounter the corresponding thing. You have to actually experiment with this to truly realise it, but very quickly you discover the complete arbitrariness of the content of experience. The "patterns" you adopt shape the experiences you have. That's why I say there's no particular purpose.

(If you haven't already checked out the Kirby Surprise - appropriate name - interview on synchronicity which is linked in the sticky, you might find it interesting: here it is [<https://www.youtube.com/watch?v=2-iMw9KA93U>]. I disagree with his M-brane theory, but other than that, it's pretty much how it works in practical terms.)

Q1: Okay, let's stick with the software/game analogy and try different terminology. "The universe telling me I'm on the right track" can also be defined as programming feedback, debugging and error messages. If \$x != 0 return error(). If \$x == 0 return "OK". Any & every programmer in the universe has written statements like these. The purpose of such a debugging statement is to let the programmer know what the program is doing, and alert the programmer in a way that's easy to spot & interpret. Weirdness and coincidences might in fact serve the same purpose.

I personally find it very interesting that at a time when I have been seriously investigating both relocating on a physical level to a new place and dimensional shifting, I'm now suddenly experiencing odd and unlikely events that happen to ding both of these items in sensitive spots. I'm not particularly surprised, because this has always been the way my life has worked: weird coincidences, random strokes of luck, dramatic foreshadowing as precisely drawn as in a book - this is my "normal", and always has been. Other people's lives clearly work differently, but this is mine.

ETA: one more twist on that analogy: That programming statement I wrote 3 paragraphs up?

```
if $x != 0 {return error();}
if $x == 0 {return "OK";}
```

In the language I'm pseudo-using, there is another possible case: in which \$x is null. In which case it would be interpreted as equalling zero (and return "OK") but in fact not be equal to zero (and should have returned an error).

That's sloppy programming.

That's a glitch in the matrix.

:D

Man, I absolutely hate the software/game metaphor! (I speak as an ex-programmer. Perhaps it just gives me flashbacks of tedium!)

Of course, I agree that "The Power" is Me, but you are still talking as if this power (which is me) is too big to fit inside... me. Which makes it sound like you suggesting something along the lines that "you" programmed the game deliberately, took on a character role as a meat-brain within the game, and are now being "guided" by the programming you previously set up?

I tend towards a simpler notion which doesn't involve any activity at all. Namely: that all experience appears in the mind, that any ideas and narrative structures you have in mind are "overlaid" upon experience, and that this "dumb" setup inevitably leads to coincidence, foreshadowing, luck, corresponding to this. If, dissolved within our "conscious perceptual space" (what we truly are), is an Infinite Grid of All Possible Moments, then the patterns we are holding in mind "filter" that grid by association, such that only the moments that fit the those patterns are active. This inevitably means that what we have "in mind" will appear in both thoughts and events. You could certainly reinterpret that as form of "programming" I suppose - defining a pattern - although it's static so there's no sense of the universe being "run". But the essence I guess is: change the narrative, change the experience... which means that:

the only power we have, is the power to think/imagine.

But, y'know, it's all one metaphor vs another - and the devious trick of this setup is that whatever metaphor you hold in mind, you will have experiences which correspond to it. (Hence the notion of "active metaphors" in the sidebar.) If you look at the world as software, try to insert some new subroutines, it will literally start behaving like that's how things work. If you spend a lot of time contemplating an Entity God, he'll probably start helping you out.

The Power is me. I am the Power. But I can't have actual awareness of that...

I'd say you can, but you can't do it at the same time that you are aware of bodily sensations and a room around you. But then, neither can you be stood up whilst also being sat down. It's just about not being able to be in two states at the same time. That's not really a meat-brain restriction as such. Even if you can't directly experience it in an ongoing way in everyday life directly, at least we can infer it from your own intentional results, and know it intellectually as a result - and operate from that.

Level 49 hobbit wanderer, seeking fellowship, please send /tell.

Haha, good. As far as the universe being pre-programmed, I'd say the world started off more in the way a dream begins: hypnagogia fragments, gradually coalescing into a scene, and then a 3D-immersive environment. There's no "plan" or design, it unfolds according to whatever is implied by previous experiences - unless you deliberately intend a redirection.

Your idea of a "simpler notion" makes my head hurt. :)

Yeah, I do realise that my "simpler notion" isn't as immediately accessible, although it is very simplifying and makes it far clearer how to create change. (The edited basic version is here: The Patterning of Experience.) It involves throwing away notions of the world being a "place" and of you being in any sense a "person", but it gets more directly to your actual experience as it is right now, using the most basic intelligible metaphor, and let you interact at that level.

The changes I'm trying to prompt are both necessary, proper, and working. Even though not quite in a way I would expect or want.

Yes. Really, everything is taken into account. It's inherently the case that you can't "pre-experience" an experience in order to know it in advance - because if you do, then that's actually the experience. You can get what you want, but unless you complete go back to void and re-seed the world, you can't pre-know or define the path.

Every single one of us experiences the universe differently, and it's a mistake for any of us to assume another person can or should share our own experience.

Agreed. Kinda my overall view, that: there is no built in division or structure to the world ("all possible patterns are available"), but by our intentional mental and physical acts we gradually define such arrangements. The world then behaves "as if" whatever we think is actually the case. Your "big ME, little me" experience is one of the available options. No option is "right" or fundamentally true, they are just different. The only thing that is fundamentally true is: there is a me of some sort (which I can never see), and it is having an experience. Everything else is up for grabs. Or even not up for grabs, if that's the way you think!

But instead we just dance around in circles with imperfect and contradictory metaphors . . .

Very well put. Although I'd emphasise the stinger which is: the metaphors we pursue tend to be reflected in our personal experience, which means that we always seem to be right. I think that's the ingredient which makes agreement about specific content challenging; but we can agree "that there is an experience" and "that we are aware". And if we know that content behaves in that subjectively flexible way, we can avoid falling into the trap of arguing about the "right way" to describe things.

The problem with thinking: just obviously, a thought is an object which appears inside experience, and made from consciousness. So it can never capture or describe experiencing, or consciousness - in the same way that (metaphor reuse alert), although you can make shapes out of sand which duplicate to other shapes made out of sand, you can never make a sand-shape which captures sand itself, or the sandbox as a whole. Sand just "is" sand; the sandbox "is" all the shapes made of sand.

Q1: Of course we always seem to be right; that's because all the possible answers are equally correct. Which makes no sense within the established confines of the sensible universe, but is nevertheless true... once you get outside the confines of consciousness to the perspective from which you can describe it.

Now if you'll excuse me, I need some Advil and coffee; as always, discussing this topic has caused me to imagine myself into the actualization of the metaphor of a literal headache.

Enjoy your imaginary medication/beverage combo! I hope it has the desired imaginary effect. I imagine that it will. Cheers for now...

...

Maybe we only notice the little things because they are little things, because they're small enough to be "possible" . . . Maybe the big shit happens all the time.

That's a great comment and I forgot to respond to it at the time. Retaining a "personal memory pattern" that persists when the "world pattern" shifts is a key challenge. After all, they are both part of the same larger overall pattern of "everything"; the whole thing shifts as one usually, as a coherent whole. So, you might say that performing a change deliberately is more than anything an assertion to remember. The act we perform is almost like a marker to which we attach the "how it was before" memory, so that it remains accessible via association.

In fact, the total pattern might be sloshing about constantly, but so long as it does so self-consistently, the apparent world and the apparent personal past tend to stay in alignment. Only if you are "holding onto" a particular aspect of this, does it get held steady, despite other changes. In "jumping", then, we try to detach from the world but not from the seed to which is attached our conceptual self and all tis memories. Probably all jumps are successful to some extent, it's just a case of the extent to which the old state remains. Total shift: only new-state memory so no apparent change. No shift: only old-state memory and so no apparent change.

(pre-coffee mumble-mumble-mumble) but then the things we hold on to, especially old grudges and so forth, doesn't that then just keep the stuff we dislike actively with us no matter where we jump? So "forgive and forget" isn't just a hoary old maxim, it's actively an instruction on how to maximize dimensional leaping.

Agreed. In older times (interpretations of the Bible even) the notion of "forgiveness" means to wipe the slate clean in a deeper sense, to literally "release it and delete it" such that it no longer exists. In this sense it's really: "forgive equals forget". Forget it or amend it in terms of the world's memory, not our personal historical memory of "stuff what I experienced".

POST: Did the two glasses experiment. Nothing happened.

Uh-huh, nice. So the glasses technique = "plausible if very unlikely" routes, rather than immediate discontinuity, in general. And the level of plausibility depends, really, on your own patterning to date. But if you've done it with intention, you'll always get results of some sort. See what happens over the next week or so.

So, which techniques are capable of producing immediate discontinuity? I'd find it much more convincing if I could experience that rather than something that might have happened even if I did nothing.

What, exactly, are you wanting to be convinced of? (Bearing in mind that nobody's particularly interested in convincing you of anything, although everyone's happy to help you towards any specific goal you might have.)

The problem is, "wanting to be convinced" isn't a very good goal - because it's nonspecific, and it's not really a goal at all. It's like "wanting to be convinced that I can run a Marathon" rather than "wanting to complete a Marathon". You best become convinced by targeting experiencing-the-goal, not by targeting being-convinced. "Techniques", of course, aren't capable of anything. Only you are. Techniques are just a path for your intention to be directed along. Which means a certain focus and commitment. It's relatively easy to get what you want through apparently "plausible if very unlikely" routes. But if what you are desiring to do is break your plausibility level, as it were, then you can work on that, but you'll either have to dedicate yourself to it (rather than "want to be convinced") or let yourself got insane for a while. Again, it's not the technique that does it for you, it's you that does it, so you have to actually commit. The universe isn't like a simulation running on a computer; it doesn't do anything of you. It's more like a static list of entangled facts or a complex diagram that you are scanning your attention across, and you have the ability to edit it.

Me, World, Experience

I want to know what kind of world I live in.

This is the crux of it, then. Really, I would suggest starting there, and working outwards from that. And I'd say it's better to phrase it something like this though, since it assumes less:

- What, exactly, is the nature of my current experience?
- By extension, what is the nature of "me" and "the world"?

That's something that can be established by direct attention. You can fairly straightforwardly satisfy yourself that everything you experience appears in your "mind" (although that's not really a very good word for it since it's not a personal mind), including any thoughts about a supposed external world. You can't think your way to this though, since you'll just keep going round the same conceptual frameworks; you have to directly perceive it to be the case, in the moment.

Cause, Effect, Experiment

I learn nothing via a "plausible if very unlikely" route.

It can be a slight Catch-22, this, because there's an element of having to soften up your own patterning in order to have more unusual intentional experiences - which in turn is effectively a widening of what counts as "plausible if very unlikely". And this applies to perceiving your actual experience too: you have to assert it in order to have the corresponding experience. It's a little like being a shape-shifter:

- If you were a shape-shifter, how would you describe the process of shape-shifting? You would just "become" the new shape; it's all you, so there's no one part causing the other part. Continuing with this: how would you work out you were a shape-shifter? The only way would be... to shift your shape. There would be no evidence of you being a shape-shifter between shiftings. Intention and deciding and all that, have similar problems: you reveal them by becoming them.

In other words, the more rule-breaking you want your experiences to be, the more you have to break yourself, or (and this is where detachment comes in) you temporarily suspend yourself in terms of patterning. The traditional way to prove the flexibility of experience it the same way as is used for all experimentation: repetition. Performing an intentional act and having corresponding results is the only way to establish a causal link.

Raise your arm now. How do you know that your arm wouldn't have lifted up in any case? How, exactly, do you go about raising your arm anyway? Do you really cause it in a particular way that you can detect, other than just "wanting" it to happen?

Maybe your arm is just part of the external world and you just assume it is "yours" and under your control because it is apparently nearer to where you think of yourself as being centred. Actually, your arm and the rest of your body are moving by themselves beyond your control, and the same applies to the thought that you do it. How could you tell the difference?

You get the idea: you can't answer these questions, except by repeating the experiment again and noticing a correlation between "asking" for the movement and "receiving" it subsequently.

Plan of Attack

So, unless you want to dedicate yourself to a bit of a blind reformatting (which you can do: it's essentially like meditation but with persistent intention) I'd suggest a plan of attack of this form:

- Spend time directly investigating the nature of your experience, to establish that it is entirely within "a" mind, and that you are "a" mind and not any of the content which appears within it.
- Perform the owl exercise for different subjects, allowing intervals between each experiment, see what appears in your experience subsequently. Repeat.
- Perform the two glasses exercises for different personal situations, allowing intervals between each experiment, see what appears in your experience subsequently. Repeat.

In other words, treat it as a proper study and conduct a structured investigation. Otherwise, through a lack of understanding, you can end up asking the philosophical idealism equivalent of:

- "If everything is really made from atoms, that means the world is mostly empty space, so how come I can't walk through walls?"

Maybe they've been encountering pictures of owls on the Web and elsewhere regularly all along.

I can't help but notice that you're thinking about this, rather than actually doing it. Either do the experiment, or don't bother. Without the experiment, you are completely uninformed. You're just sloshing about in your own thoughts. When the owl exercise kicks in, it becomes pretty obvious that it goes beyond confirmation bias. The reason it's dubbed The Owls Of Eternity™ is as a bit of fun, but it's relevant because the persuasiveness of it is that owls apparently come to you as events, and as encounters which suggest retroactive change. The progression of plausibility develops something like this:

- conf. bias => coincidence => synchronicity => "manifestation" => shifting => "jumping"

And the apparent location of the encounters like this:

- internal => external => eternal

The extended pattern thing, that's just what seems to happen, but anyone doing the exercise is perfectly able to be more specific in their intention and to decide what counts and what doesn't. Remember, the point of that exercise is simply a bit of fun to demonstrate (without having to put any effort in) the pattern-based nature of experience in a way that shows it's not simply selection from pre-existing scenes. Or at least, not pre-existing scenes in 3D; you could describe it as selection from a 4D environment. With that experience under your belt, you've got a flavour of the thing, and it's easy enough for you to design your own rigorous experiment if you like. Again though, nobody can prove anything to you in this area, just as, for instance, nobody can prove to you that you can be awake in your dreams ("lucid dreaming"), or that there's such a thing as experiencing oneness ("enlightenment"). Or that it's possible for you to train up and run the marathon. If you want to explore how your world works, then you'll have to conduct the investigation yourself. Nobody can do it for you.

In other words: Do it, or don't do it, but if you don't do it, there's no point in discussing it.

...

That doesn't sound like jumping to another dimension to me. It sounds more like The Secret.

Well, it's not that. It more like an umbrella term for "applied philosophical idealism" to force 'glitches' via pattern-shifting. I guess: read the links in the sticky post.

[This] revolve[s] around the notion that physical reality can be manipulated by the mind because it is a construct of the mind.

Pretty much - although exactly what we mean by those terms matters; strictly speaking there is no physical reality as usually thought of, and the word "construct" implies a separation that isn't there. You might see "patterning" as the generalised idea behind all experience. From moving your arm to changing the world, it's all the same. It's a ground-up account. For instance, here, the idea that the world is a "spatially-extended place unfolding in time" is pretty much thrown away. Space and time arise with experience and not outside of it. In this sense, this is a bit like "magick" but rooted in the philosophy of, say, George Berkeley's Three Dialogues, Kant's transcendental idealism, and the non-duality traditions. An applied metaphysics that deals with a personal subjective slice of the world, a private copy within you. Meanwhile, the Law of Attraction (attracted from where, how?) and The Secret (worse) are basically crap magick, poorly applied and without a properly defined worldview. They do have the advantage that you don't need to flip your world around to think about them; but they have the disadvantage of not really making sense or working very well as described.

POST: Has anyone experienced this?

[POST]

Detaching, meditating, reflecting have been regular events in my awareness these past weeks.

These past days, something interesting showed up. I've been losing my sense of 'location' during random times throughout the day and night.

It is not lethargy or anything, I eat well and work out. During those few seconds of this phenomenon, it is like everything feels automatic. I apologize if this sounds pretty vague, but since it is so unique, I've nothing to compare it too. Please feel free to ask questions, to help me better gauge this.

[END OF POST]

The feeling of being everywhere in the current experience while being nowhere in particular?

Q1: Well it's not like that 'infinite conciousness-nirvana-Buddha' thing. At least, it doesn't match up with what I imagine infinite conciousness to be. But like. . .you know how you get your feedback that your body is like this - that your hand is resting there (hoping this doesn't sound confusing); I've been losing my 'location' when I'm not feeling the usual feedback. The '3D hologram experience' becomes a unified location. Like one thing. As if there's no dividnt between the cloud in the sky and my smallest toes. Rather than being the avatar of my body, it's like being an avatar of experience itself, but this avatar has only had seconds of it at 3-4 times every 24hrs frequency.
EDIT: Wow, this shit is weirder than I realized. But that's the best I can describe it to be.

What you describe is what I mean, I think. It is like you used to be located, say "here, behind my eyes" while your hand was "over there", but now the whole thing is "you, here"?

The sense of location you usually have is just that: a sense of location. You are always the whole experience even when you have that. What's happened is, that sensation is occasionally fading out. It's a little like having had a tense neck for your whole life, and so always being more aware of that location and seeing other things as relative to that. One day, your neck relaxes, and that artificial set of relations falls away.

Assuming that's what you are describing...

Basically, I'd forget all esoteric descriptions of this; they add another level of abstraction and complication I think, usually written by people who haven't had the experience. I see it pretty simply: if you allow your experience to relax, you attention naturally opens out (or dissolves) and you become, or recognise that you always were, "the full imagination room".

POST: Both methods

Remember, you are not meant to be "making it happen". That part happens automatically. It's a "dumb" patterning mechanism. So doing multiple method simultaneously, and suggesting different possible paths - that's beyond your remit. Your job is simply to make a firm decision about what your target state is, perform an exercise (which activates that target pattern so it's overlaid on subsequent experiences), and then don't interfere. Because the moment you do the exercise is the moment the change is made - your new deterministic trajectory is laid out before you - and then it's just a matter of waiting for the corresponding experiences to be encountered.

...Okay, firstly remember that what matters is here is that you know what it is you want - you are not "sending a message to the universe" or anything like that. What you are doing is, finding the target state (which already exists) and connecting to it and shifting to it. Which gives you an idea of how to word things: "I would like a better job" is the description of a state where you would like a better job (i.e. don't have one). "I have a great job" is the name of a state where you have that job. What is important though, is that you pause and actually do access that state. This isn't difficult, mostly people do it automatically, but it's worth being conscious of it. Just pause now and think of something or someone you desire, but think of them being with you and what that would be like. When I say "think of", I mean in the sense of pausing and waiting for the feeling-sensation that would go with having them.

Now, this is something that comes to you, not something that you create. Typically this felt-sense appears in the mid-area of your body. Having this is the difference between just making images in your had, and actually having connected to the target state. All techniques are really based on accessing the target state in this way, and then manipulating it into being the dominant contributor to you experience going forward. So for the Two Glasses Exercise, if someone was unemployed but wanted their dream job, their labels might say something like "unemployed" and "dream job". Or if it were a specific job, then: "journalist". The "contemplation" part of the exercise is meant to encourage you to pause and connect to how those situations feel, to the states they represent. This is why you don't need to write out a big description; the words are merely handles which you attach to the actual states.

Hopefully you can see that it doesn't matter how other people feel about you, or even where things supposedly are in the world. This is all about states which lead to experiences. In the same way as there are no people, places or objects behind the screen of your TV, there are no external people, places or objects behind the 3D-immersive sensory experience you are currently having about being-a-person-in-a-world.

In and of itself, I don't think passing doubt or belief are important, except in the sense that you attend to them and end up embracing the doubtful view (but that is what people tend to do). For the duration of an exercise, you have to - if not believe, then commit. Just like, I dunno, if you were lifting weights but didn't really think it was possible, you would even really dedicate yourself to it - you wouldn't fully intend the result.

The glasses exercise to some extent misdirects you with its form obviously being unrelated to the situation and outcome, so that you neither believe nor disbelieve, you just do it without really thinking it through, and probably don't give it much thought. That's why it's a good demo. Once you have given it critical thought, however, you likely need to persuade yourself of a model that goes with the exercise, or go for a 'surrender' approach (accept that "the act is the fact"), so that you can commit again. Although I'd say: I've you've read Goddard and stuff on patterning, it should be easier now to see it as "state anchoring and triggering" in an "imagination space", perhaps?

If you can take all that on board, think of this moment as your super-flexible staring point, then take it from there - that's probably the way around this.

This is probably a dumb questions, but what about weed and doing the exercises? If only for the complete forgetfulness, it's hard to interfere when you can't remember even doing it :P

Haha, well I've never tried it, so feel free to experiment! You don't really need to forget; you just need to not interfere and so end up re-intending things. It's actually pretty robust if you do the exercise with full commitment; after all, it is an actual state change.

POST: The question every newbie asks

Dimensions are really a metaphor for changing your state. A radically changed state results in an experience like that of changing worlds: facts shift. Your experiences are the structure of mind (there is nothing beyond mind: try and find something that is!) and so all changes are a restructuring of the mind really, it's just a matter of how deep and fundamental the changes are.

Ah so that's why you can't go back.

Right. If you really did return to the precisely the original state, it wouldn't be much use to you - things would play out in exactly the same way (because the subsequent experiential path is the state). Plus it would be a sort of suicide, in a way.

The true original state is the perfect universe.
All imperfect worlds are "holographic projections" (metaphorically speaking, from the perfect world or universe).
Hence the true goal IS a return to the original state.
One may ask why did we ever choose to leave the original state.

Surely the universe is always perfect? There's nothing necessarily special about the resolved state where no patterns are activated - the state of undivided wholeness. "Eventually" it has to become divided again - in quotes because this is all "before" time and therefore eternal. And in truth, it is never really divided, because it is always one thing "taking on the shape of" an experience of division. So I'd tend to say that "goals" are human concepts, and the universe (or, consciousness + patterns) has no goal really, not in the sense of a considered aim, other than the tendency to resolve itself, and then become unresolved, and so on, from a strictly personal perspective.

POST: What if

I think: the simulation concept is just how modern-day folk get their heads around the fact that there is no solid world behind the images, sounds, and textures of everyday life - and that intention is global rather than local. (It does more than just move your arms.)

It's all imagination. The concept behind "jumping" is pretty much that you are changing the "world-pattern" to a desired state - which is similar to the concept of "changing a line of code" or "updating a data structure". It all amounts to: updating facts, and subsequent experiences being in line with the new facts. The problem with the simulation metaphor, though, is that it tends to encourage you to think that there is something "running" the simulation, that you are "in" something, and that other events are "happening" other than your present experience.

Are the people around me are just philosophical zombies or are they experiencing life like me?

They're just images, but then so is the person you assume yourself to be. No person ever experienced anything - just as no sound ever experienced music - although as consciousness you might have "person-formatted" experiences. It goes something like this - **What you are is an "open conscious space" which has "taken on the shape of" an experience**, the experience of being-a-world-from-the-perpective-of-a-person, as a strand of thought. This means that the world is not to be viewed as a "spatially-extended place unfolding in time", but rather a "resource", a toy box of available patterns from which you-as-conscious-space select facts, and therefore experiences. In effect, you have a private copy of the world. This gives us: that you are not a person either, that all apparent people are a continuous part of the environment or world-pattern, and that you are experiencing being everyone right now, in a sense. Which leads us to: Are there no other consciousnesses, and if so do they share worlds? Well, there is only one consciousness (because it is "before" division, location and time), but for convenience we might think of there being ""parallel-simultaneous" experiences, each a copy of the world, not sharing a space but sharing a resource. A sort of contextual overlap. If that seems to dodge the question, then I suppose it does: it's one of those "does not apply" things. You could always experiment with adopting the concept of "all people are aspects of me" for a while, then adopting "all people are separate individuals" for a while, and noticing how that shapes your experiences. It's more informative than trying to work through it in thought, since we hit the hurdle with it: since time and space are part of experiences rather than the context in which they arise, and thoughts are experiences, it is not possible to think beyond your own conscious space in its current format.

Thanks for this detailed reply, I tried to observe if people behave autonomous and came to the conclusion that they do, only didn't I take into account that my beliefs format my observation. I also paid attention to (inanimate) little details, and even the smallest things like stains or bits of dust seem to be filled in the moment I step into a room, which is quite astonishing it's somehow hard to put into words but sometimes I think if everything is just in mind how come that even the littlest changes get "saved"?

Well, I wouldn't say "just" in mind really, that sounds a bit dismissive! ;-)

The mind has no resolution; things aren't stored as data, like in a computer. If you think of each "fact" of as an unbounded pattern, then the current state of the world is the combination of all patterns. What resolution do patterns have? None. It doesn't matter how closely you look, you always see... more pattern. Because there is no resolution, there is no limit to how much complexity can be "stored" or "dissolved into" the same space. Is there a limit to how many of those patterns I could stack up? No, because the result is always one pattern. As for "saved" it's better maybe to say that things become "fixed" by observation; they become "defined". The whole landscape of patterns is already there, the relative contributions shifting around somewhat as you intend and change your views, but when you make an observation then that particular aspect becomes a "fact" and does not shift so easily anymore; its intensity and its relative contribution is heightened.

So, we have that:

- There is no resolution limit; there is no granularity involved.
- There is no "saving" in the sense of adding a piece of data into a storage facility; the entire world-pattern always exists and is eternal.
- What does happen is that the relative contributions of the component patterns varies (the relative intensity of "facts").
- When an observation is made, that "defines" or "fixes" that pattern, such that it becomes an observed fact or certainty; it has a very bright relative contribution as a fact.
- Intense patterns are not necessarily irrevocably factual; their intensity can be reduced again however it rarely occurs to people to try, since they seem so certain.
- The beliefs you have adopted are also effectively high-contributing patterns - "minor facts" - and so shape your experience accordingly.
- Whenever you adopt a new view of the world, the patterns associated with that view become more dominant, and your subsequent experience falls into alignment with that.
- You can create "fake observations" within the mind and have them contribute as facts just as much as a "real" observation would.

It's relatively easy to explore these ideas and test them out for yourself, to see if they are accurate or not. Spend a week "pretending" that things are a different way from how you think you know them to be, and see if things don't line up to provide you with evidence of your new approach.

Thanks again, this is a really good framework. I will think of some ideas to investigate this for me further, people seem often talk to much and philosophize about this instead of actually investigating their experience. At the moment I try to get rid of is my tinnitus, so annoying :(

Agreed absolutely. These things that are difficult to put into words and concepts are actually remarkably simple in experience. To be honest, if everyone just ran with the metaphor of the Imagination Room and explored it thoroughly, the rest of it would be self-evident. Meanwhile, your comment reminded me of this thread [POST: [META] Tinnitus and the Mandela Effect - who here has experienced both?]. Never had tinnitus but I imagine it must be very frustrating.

I now seem to understand why van Gogh cut his ear off, but it should be fixable, maybe I'll go with the two glass method since it's hard to imagine quietness when your ears are ringing the whole time.

Go for it. (Maybe knock out a couple of canvases before you do, though - just in case.)

Ear is still there :D But the tone switched from the left to the right ear and is now much more subtle, feels like it's fading.

Well, that would be a different sort of masterpiece, I suppose - and priceless in its own way!

...

Q3: *it is not possible to think beyond your own conscious space in its current format.*
Any links or suggestions on how I can reformat?

You can overwrite formatting, but of course you'll never get outside of your space, because: a) it has no boundaries anyway, and: b) you are it. But it's all about what can arise within it. So, you change your formatting by ceasing to continually assert the current patterns, and by imagination (which really means: to bring forth a particular pattern and have it contribute).

Helpful as ever, just one more quicky. What led you to this path?

Long-term interest in mind, perception, reality, thought, philosophy, magick, science, art and creativity. The attempt to understand them all at the same time, leads to: a) confusion, and then: b) maybe this. Hopefully some use comes of it - only you can be the judge! ;-)

POST: How to share information with alternate selves?

Not literally of course - since there is no other "you" as such - but as with anything, you can use the "as if" concept as a route to an experience, which includes the acquisition of information and skills. People have done this in different guises for a long time, I think - whether that be via "higher selves" or other apparent externalities.

I agree, I believe my "Holy Guardian Angel"/Higher Self/Spirit Guide/Silent Self is a timeless, dimensionless, all encompassing version of me

Yes - I'd clarify it by saying that, intellectually, we tend to confuse the content of our sensory experience with "us", when of course we are the larger context in which, and of which, that content appears. Which is a bit like saying that the part of the room you are looking at right now is "the room" while the room in its entirety is "the higher room". Or better: that you are an like an origami paper fortune teller - you shape-shift yourself in order to prioritise a subset of potential content, then unfold yourself to reveal certain aspects explicitly into the senses. You are always the entirety, it's just that only one "slice" is expanded as a sensory-space experience at any one moment. That's why there's no point in looking for higher selves to "do" things for you as such; your higher self is more like the extended pattern of the world (as your present state), rather than an intelligence which can operate independently of your intelligence. You-as-context is the only intelligence.

POST: Does telling other people interfere with jumping?

Keep to a subjective perspective here, I'd say. What does telling them imply about your view of the approach, and how will you receive their responses? There's really no benefit to telling anyone, because there's no sense in which they can contribute to your effort - however, seeking confirmation or taking external comments seriously can reflect an underlying view, and affect your ability to commit fully to the intention (which is what really matters).

I kind of get this; I've discussed the possibilities with my roommates (my girlfriend, and our roommate who is pagan and who commented that the two glasses feels like a spell to him). I've told them that I am planning on trying it, but I likely won't tell them when I do.

Well, a "spell" is just an action you take where you deliberately use the fact that: although sensory experiences are apparently local, all intentions are actually global. It's better to keep things to yourself, because the extended associations that are triggered as/with your intention include whatever worldview elements you have adopted. Better to make up your own mind, and proceed from there, therefore (in my view).

Yeah. I briefly considered actually doing it with them present, but I thought quibbling over word choice might limit the results.

Right. Also, the word choices should arise naturally from your own contemplation of the two situations or states. Which is not to say that you can't 'jump together' with people - but really it is a "single-user model" (although not a personal model) and is best approached that way I think.

It does raise the question if bigger changes could be achieved with more minds agreeing as one, though. For instance, a group of people all doing the two glasses together with the intent of swaying an election?

This is not a consensus reality. (Unless you really want it to behave like one, of course, in which case you might have the corresponding "as if" experiences. I would say it's a 'personal preference', but that would probably just be confusing...)

I get that, but if several people all jump for the same (outside-of-themselves) thing, would they not end up in the same dimension? I suppose they could each jump separately as well, and end up in the same dimension. Just wondering if the jump would be easier to achieve if they were all reinforcing each others' beliefs.

Maybe if we reformat it this way...

Okay, so there is nothing outside of you; you never go anywhere, you just change state. A "dimension" is a metaphor for a more discontinuous change of state (moreso that a "shift" or "manifestation"). And to speak of "each others' beliefs" doesn't really make sense...

However - Generating for yourself the experience of gathering with a group of people, and performing an act, may provide a "plausible excuse" for you to allow changes to happen. You are creating an unusual act to which you can attach extraordinary meaning or causal power. So it can definitely be beneficial in that way. After all, what does staring into a mirror really do? Or pouring some water? An occasion to focus, to intend deliberately, knowingly.

From a comment I made earlier today:

- Act + Intention + Detachment = Shift
- Assigning a meaning to an act is what gives it causal power.
- Assigning a meaning to any experience can give it causal power.
- Habitually observed cause-effect relationships are the outcomes of previous assignments or associations.

Where an "act" can be a mental or physical act (since of course they are both the same thing: experience in the mind), and any object is also an aspect of experience. So experiencing "a group of people doing something" is as valid an "enabling act" as any other.

Something to ponder:

- How can you tell whether you have "jumped dimensions" with other people **vs** you have "jumped to a dimension" where the versions of those people are just very similar **vs** you have changed state but have left those people's patterns intact?

And: does it matter to you?

Q1: As someone who feels more sure of herself when other people agree, the validating force from outside could make the difference in whether or not a jump is successful. So it "matters" in that sense, though I suppose the argument could be made that if I need the validation from other people, I don't have a strong enough will, or can't detach enough, to jump at all. =/ (For the record, I'm trying the Owls-but-with-a-creature-that-is-not-an-owl, and haven't tried the Glasses yet.)

Actually, my underlying point is that **it's all you** so it doesn't matter how you go about it. What you truly are is the "container" within which all your (apparently) personal experiences appear. You have infinite will, as it were, although you have whatever "formatting" you have accumulated so far. Which is to say, we work within our own preferences and according to our dispositions.

So, gather a group of people if you want to - but preselect them according to their enthusiasm and alignment with your intentions. No point gather together aspects of yourself that are antagonists in your story of change (oh my god, what phrasing, heh, sorry). But the glasses technique doesn't depend on your belief. (In any case, belief doesn't make things happen or not, it just influences whether you actually commit and do something properly in the first place, or whether you later undo it by rewriting it.) Just follow the instructions properly, including the last point, and let it take care of itself.

The hardest part of all this is actually being okay with the fact that the change occurs in the moment you do the exercise, and that there's nothing more to be done after that. The results will come to you (or rather: you will encounter the results) without further deliberate action.

POST: Need Advice About Jumping.

Okay, so the "no effort demonstration" method is the Two Glasses Exercise which, typically, results in "plausible if unlikely" events taking place leading to your goal. That's a good way to experiment and prove to yourself that there's "something to this". One of the key ideas in this subreddit is that we don't believe anything unless we have demonstrated it to ourselves.

Going beyond that...

You should view so-called "jumping" as a change in the state, like you've updated the facts of your personal copy of the world. You aren't going anywhere, you are changing the content of your ongoing experience. There's inevitably some collateral shifting for big things, but you are not going to have to worry about overnight discontinuous changes of everyday things - parental disappearance, bad boyfriend reappearance - because you are unlikely to seek to push past the "plausibility" boundary. You might think of this as a way of "speeding up" changes in the direction of your intention. The most direct approach is to directly engage with the concept of The Imagination Room but really, for the sorts of things you are likely to want to explore you can keep it simpler - and you should treat this as an exploration, of the nature of experience, as much as a quest for results. So, try out the glasses technique for anxiety and depression first, follow the instructions properly - including the last one (which says you should carry on with life afterwards, and let things take care of themselves, because the results will come to you). Once that has settled, perhaps repeat the exercise with your weight loss in mind. Again, this approach is for "plausible but very unlikely routes" to the change happening. Feel free to try out the mirror or patterning approaches, but I think it's better to start off with something less obviously daunting and disruptive first.

Off topic - It's amazing to me that people sometimes approach this whole thing without consideration. Imagine if there was a computer program that you could just type new facts into and they would become instantly true. Would people just start bashing away at the keyboard without having experimented to find out what the correct command syntax was? Um, yeah - me too. :-)

POST: Does Dimensional Jumping actually really work?

Why does it seem impossible?

My guess: you are thinking that the world "out there" is of the same format as your current experience, that it is all laid out in space and unfolding in time and you are exploring it. In other words, that spatial extent and unfolding change are independent properties of the world, rather than properties of experiencing. If you glance around the room now, shifting your attention around it and taking in different parts one at a time, you might say that you are selecting a "2D slice" from a 3D environment. What if the overall experience of the room was like selecting a "3D slice" from a 4D environment? And what if that 4D environment was itself a "slice" taken from an "infinite loop"?

But none of that matters, really, if you don't try out the demo exercises and find out directly (see sidebar).

POST: The 2 Glasses Experiment failed to work for me.

Be more informative?

The 2 glasses experiment is apparently a big lie and can't deliver something specific.

Oh well, it didn't work out for you - at least you did the experiment. Now, you can either investigate why it didn't work, if you feel it might be worthwhile doing so, or you can just dismiss it and carry on with your life.

I'm dismissing the whole subreddit, boy-o.

Not quite yet, it seems! ;-)

Q1: Dude, today I did the two glasses and my desire manifested in two hours. I got exactly what I wanted. You should gotta chill out after, and know it's done!

Q2: I was very chill after the experiment... I think the main problem was I was asking for something very specific and not the usual vague stuff that can coincidentally get noticed later on unrelated to anything at all...

Well of course, all results are coincidental - in the sense that you perform an act with the intention for a specific result, and a short time later that result you wanted "coincidentally" happens, in this case by apparently acausal means. (By which I mean it is not logically causal in terms of the world's apparent structure.)

The only way you rule out "just" coincidence, is to do the exercise multiple times, such that the "unlikeliness" builds up to such an extent that you have to think it's starting to look more like causality, than just blind numerical overlap. If I were you, I'd give it another go. The purpose of the exercise is to demonstrate something about "the nature of things" really, rather than to be a tool, although it is that also. It's a zero-effort, zero-commitment demo of what might be possible. So I wouldn't be too dismissive of the whole thing based on one try-out. In other words, if you are doing a "one and done with it" approach here, then that's fine if that satisfies you there is nothing to this, but personally I'd give it another spin (perhaps for something you're not too invested in, not too reality-breaking, but is still very unlikely), given that there are a reasonable number of people reporting positive results here. More than think New Zealand has moved, even.

Q3: what you resists persists. you obviously were worrying about it failing thus feeding that option energetically.

Q2: No, I was the exact opposite. I really believed when the mod wrote 'it really works!', it would really work. Talk about hitching the wrong wagon to the wrong star, etc.

Oh Roril, really! Why would you hitch to anything or anyone? It's an exercise designed to demonstrate something without requiring anything on the part of the participant, which happens to double up as a tool. More often than not, because of its construction, people get a result. If they overthink it and so don't get the full result, they still usually get "patterning" in their experience relating to it. If there's nothing - then the next step is to give details and 'debug' the process. (Everyone here is here to help.) Or if

someone's not interested in doing that, they can just move on. Rather than, say, seeming to take some sort of personal offence at it all...

The sidebar is pretty clear on the correct attitude to take.

POST: [deleted by user]

Quick answers - Although the state change occurs at the time of the exercise, and you may experience a "felt shift" at that time, it's not required or to be expected. You can think of it as having updated a single fact in the world, with that now incorporated into your subsequent experiences over the coming hours, days, weeks. I'd say the most important thing is to be 'allowing' of the shift - which is to say to not be obsessed with the change (which tends to reassert the problem, hence "carry on with your life") and to be okay with whatever happens (why it's harder for things which really matter, unless you have reached a point of surrender). In particular, you have to be open to things moving as a whole, because everything has to move a little in order to have one thing change. Hence the joke imagery of an extra tin of peaches appearing in your kitchen cupboard, as a "collateral shift". Meanwhile, because you've outsourced the change to an operation on external "handles", I'd say things like strength of will and desire should not matter. You might contemplate what "will" and "desire" actually are. Are they things that you can experience? If you are experiencing them, what is the detail of that experience? Certainly, a sense of effort is not an relevant to making change. Are those things a sign of resistance to shifting? Is a "desire" perhaps just a difference of location in your perceptual space - a pattern which is localised "over here" rather than arising "over there"?

Let's explore - For the fun of it, let's maybe do a ground-up exploration. First of all, what words did you choose and how did you go about choosing them?

Looking at it from the other end of desire -- Can boredom hinder the shift? I find myself getting somewhat indifferent to some of the stuff that I have 2-glassed eventhough I don't have them yet, eventhough I believe they will make my life better in the longer run. Won't being too pleased with the status quo prevent me from grabbing the right opportunities that present themselves?

If you've already done the exercise, it won't affect it I'd say - the update has happened. Unless you actually spend time deliberately thinking about being bored about those things. The indifference may actually be related: you can't desire something you already have... so just carry on, let experiences come to you.

I'd like to explore the meaning and the nature of experience.

Well, that's really what the subreddit is about, I'd say - the rest of it is the icing on the cake. And it's a nice cake; it's not a Battenberg one. As for your current intention, two thoughts. The first is just that it might be taking a while, as in the results are in place but a while away, because logically for it there's (literally and figuratively) a lot of distance to cover. The second is that if you might take a pause and, sitting quietly, "ask" your inside what the best word for each situation is, what words really belong to the situation. The more your view of experience shifts toward it being a "patterned space" rather than being a body in a "spatially-extended place unfolding in time", the less barriers there are to things happening very quickly - after all, it's just a matter of overlaying or triggering a desired pattern on top of your awareness.

POST: Reducing to one word? (two cup method)

My recommendation - You contemplate the situations, and let the word arise from them. You just "sit with the situation" (in the belly, as it were) until it forms in to the most appropriate word. This is what makes the word a "handle" onto the situation or state, rather than simply a disconnected term. If people create the word unthinkingly, it generally is such a handle. When people instead work it out intellectually, it's much less so, and you're more likely to get results which are just the extended pattern of the word, rather than the specific situation. (The instructions are written in a way that's intended to encourage that "just follow the bullet points" attitude which means you don't overthink things.)

So ideally, then, "the word comes to you"; you do not construct it.

POST: Is it possible to be forcibly shifted by another you? Is it possible to shift to a universe that is worse than this one?

There is no "other you", so those questions don't apply (see text and links in sidebar). Certainly, it's possible for your state - for that is what is meant by a "dimension", albeit with a specific meaning of "your" - to shift to one from which a less pleasant ongoing experience arises. However, from this perspective there is nothing "out there" to "force" anything at all.

My thoughts are a bit abstract on this topic

Well, that's part of the point of the subreddit: to explore how we think about this stuff, test what is true by attention and experimentation. The question to ask is: what exactly are "you" right now? Only when you've answered that clearly can you work out what it would mean to "jump". You also need to ask yourself, what is "the world"? Is it a "spatially-extended place unfolding in time"? A place in which you wander about, as a body? Or is it more like a "set of facts" which constitute a state, from which our experiences arise?

Suggestion: We never actually experience ourselves as a body walking about in a place; we never have that "outside view" of ourselves. That's just something we think. Our actual experience is subjective; we never experience anything at all outside of our minds. Even our thoughts about a world outside of our minds - they also appear inside our minds. Our minds have no outside?

Anyway -

So, imagine if what you were truly was a sort of "open aware perceptual space" with no content in it. Then, a "3D-multisensory image" appeared within it: this moment. This includes your body sensations, the visual image in front of you, the sounds dotted about at various positions. You are not any particular part of that multisensory image, although you identify perhaps with a particular location (a dot behind the eyes, perhaps). From this point of view, your ongoing experience is like a series of "3D frames" appearing in your perception. Each frame is pretty much consistent with the last, as if there was a set of stable underlying facts behind it.. If suddenly your experience changed such that it seemed as if those facts were now different, that would be a "dimensional jump".

Related metaphor: The Imagination Room

POST: Tried the Two glasses

Q1: Great to hear they're feeling better!
I experimented a little the other day without actually using the glasses. My dad hurt his knee and he's a UPS driver (doesn't work out well for him) I summed up the current and the intended states, and visualized the changing over and the next day he said he hadn't had to take any pain medicine since the afternoon before. I just smiled and told him I was glad and the rest he's been getting must be helping. :)

Nice. The next experiment would be: don't even bother with the visualisation, "just decide" how things are.

Have you used this technique? Just deciding, I mean. I'm also glad that both of you guys had success. TG, one more question, have you ever tried the 2 glasses technique for more than one intention at a time?

See: The original Just Decide call to arms and the related posts, Overwriting Yourself and The Patterning of Experience. The issue is to not interfere with the subsequent unfolding of ongoing experience, and in effect counter-intend the state you have "decided" into place, once you've done it. (Which is why the final instruction in the two glasses exercise is written as it is.) The original idea was for body movement, then extend it to everything.

EDIT: Your edit. So, I wouldn't go for two unrelated changes within a single exercise. Do one, wait a while, do the other. Remembering that the true purpose of this is experimentation and exploration, rather than just a quest for results. And if we're going with the patterning model, you're going to make all sorts entangled overlaps, and you'll struggle to come up with composite words to capture two situations. Seems too much hassle!

I wasn't clear on my second question. When I said intention, I meant can you perform the technique once, per intention, but for multiple intentions. Example: I have 5 intentions, so I do the 2G five times, each time with a different problem/outcome in mind.

Oh I see - doing each intention from a fresh, separate setup. Yes, that's fine. Leave some settling time between each one though I'd say - ideally at least a week, definitely more than a day.

Thx, TG. Funny that your screen name initials are the same as the "Two Glasses (Technique)."

Yeah, I have to admit I was temporarily a bit confused by a couple of posts when people first started using that abbreviation for the exercise!

POST: Change your beliefs change your world

But what exactly is a "belief"? I don't think it's necessarily a straightforward thing to answer, at least not in a way that leads immediately to a strategy for changing one's experience.

Q1: For me, there exists an interaction between the concept of "intention" and that of "belief". Intention is a specific action that I am capable of performing, through the application of my capacity to will. Belief seems to be then a word used to explain my expectations that I carry around my reality, which in this model would be intentions without active, aware participation. It seems to me that my current expectations about my reality, which are the only practical applications of my beliefs, are limitations upon my ability to intend. In this sense, without active and aware participation, beliefs serve as a proxy for intentions that are created unknowingly, or ignorantly. In the concept that you can "change your beliefs and change your reality", I would say it is more accurate to claim that becoming aware of, and taking responsibility for, all of your "beliefs" would reveal that your current reality has been created by those intentions that have been occurring without volition behind them, or with an ignorant volition. The true creative power is the intention, or volition. Looking back at this, and OP's reply above also, it seems the word belief is another name for past intentions. When you view it that way, and with the goal of most effectively causally affecting reality, to me the most constructive method would be to willfully create new intentions now without regard for "beliefs", rather than attempting to change those patterns of past intentions. In fact, the very act of acknowledging those past intentions as a pattern called a belief, it is essentially the creation of yet another intention, reaffirming the power of those past intentions.

I broadly agree with this. I do think that "belief" is probably a word best avoided (see comment above) unless we narrow its intended meaning. If we instead just go straight for "the patterning of experience" - as an accumulation of intentions, as you say - then we have an actual model to base our approach on, and a line of investigation to explore. Then, we can reserve "belief" for what we think is possible, when we are thinking about what is possible. The belief itself does not dictate what is possible, only what range of experiences we are likely to intend. Obviously, there is some overlap here, since to think about the possibility of something will to some extent intensify that pattern and make it likely to arise - it is a minor intention all of its own, as you say - but that is not what most people mean when talking about the effect of beliefs.

It seems to me that all though all deliberate thought has a state-shifting effect, there is a useful distinction to be drawn between simply thinking something (e.g. thinking "owls" for a while) versus asserting that something is true (e.g. thinking the fact "owls are filling up my life" until it is fully intensified). Although the process is the same - a pattern is strengthened relatively via attending to it - it's the additional context of the latter which I think deserves the title of intention (asserting a fact of the world), as opposed to simply thinking (dumb pattern activation).

So, pretty much as you say - except that I'm keeping "belief" as something that refers to the conceptual structure one has about the world, and not necessarily part of the factual "world-pattern" itself, because sometimes those two get conflated, leading to a misunderstanding of what is being done. (Which is perhaps why people sometimes wonder why what they believed was going to happen, didn't. They were looking at the wrong "strand of thought", a parallel construction about the world, rather than the world itself as their dissolved state.)

But it is definitely an open question for me, one that I would love more opinions on!

I think this is the point where we realise that one of the hurdles we have, and one of the mistakes we can make, is the initial tendency to confuse the auditory or visual imagery of a thought with being the intention rather than simply a sensory handle onto it. The intention itself is a felt-meaning-context and not necessarily even much of that - a very subtle knowingness-pattern. But not that either! It's a dimensionless fact, I suppose. The experiential aspect depends on the intention itself, and more.

We might think of it as a sort of a reverse insight, perhaps?

By this, I mean that sometimes we encounter a situation and suddenly we just know the full extent of it. It doesn't come in the form of words and images, and you'd struggle to call it even a feeling as such - it is just knowing. When we intend something, what we want to do is sort of create such a knowing and intensify it. Of course, we don't actually have to do this directly - it's probably much easier to perform a physical or mental act which simply implies it - but if we are serious about our experiments, that's where we're heading. Anyway, the more that we release our hold on body tensions and other held patterns which result in ongoing sensory noise - via daily releasing and exploring "just-decide" and so on - and the more we settle out into a nonattached allowing, the more this background felt-sense becomes clearer in general and moves into relatively greater prominence.

This is what I was trying to reach for in my early outline post: The Patterning of Experience

In the end, the difficulty with defining what "an intention" is and what "intending" is, is that it is not actually one thing. If we called it "changing the landscape" then the experience of doing this would depend on the current and final states of the landscape, and whether and in what way we were looking at the part of the landscape we were changing. Changing "flat" to "hilly" would likely have a sensory feeling of "hilliness", for example. If we were standing on the part we were changing, we might have a massive experience of vertigo... but if it were some more distant contour, it might be a much more subtle experience. And so on. One of my earlier metaphors: If you were a shape-shifter, what would "shape-shifting" be like? And what would be the difference between thinking about your target shape, and actually shifting to it and becoming it? Suggestion: the experience would be one of change. What we experience when intending is the experience of shifting, not of the actual intention/intending itself as such, since these terms do not refer to specific things at all.

TL;DR: An intention is not an object, and intending is not the creation of an object.

EDIT: Re-reading this comment, it comes over as a little unfocused, I may do a re-edit if I get a moment to make it clearer.

...

Interesting ideas.

My first point on this:

If we intend for something to happen but our belief structure won't allow that to happen were letting our past dictate our future.

is that to me, there is no retrocausality with intentions. Instead, I would see the situation you've described as an intention for something to happen, but before the actual realization of that intention, another interfering intention is caused by you, and ultimately the more recent of the two intentions is actualized.

Another interesting thing to look into is your idea:

it seems like beliefs are one step below intention, it like we create our intentions from our beliefs.

I can see this being true from the perspective that up until this point, we have experienced a certain set of things that create in us credible possibilities for experiences. Intentions that I put out, in this context, must be drawn from within this set of possibilities, otherwise I wouldn't properly create the intention, and the failure would reaffirm my over-arching intention to sustain my context of possible experiences.

A question this brings up would be: is it possible to change your beliefs with intentions? If beliefs are truly one step below intention, then that seems impossible. What do you think?

...

I'm going to disagree completely.

I'm not sure that you are disagreeing?

My question to ponder was, what is a belief, meaning what is its nature? Is it a structural pattern of our subjective world? Or is it a concept, an abstraction we use when we think about our world? Do we sometimes use the latter to refer to the former, but then focus on trying to change the latter? That's what I mean by, without nailing exactly what we mean by "belief", it's not necessarily obvious what it is or how it shapes experience. For example, if a "belief" is a thought about the world that we have, which leads us to take some actions and not others, that is one thing. Altering our beliefs would alter our behaviour, perhaps, but would not in and of themselves alter our "reality" except indirectly. For instance, we "believe that" we are unattractive and so we don't choose to approach that attractive person, or avoid situations where we feel being unattractive will embarrass us.

On the other hand, if a "belief" was bound up with the actual factual structure of the world, then to alter our beliefs would be to shift reality itself (using those terms loosely). In this case, it is about more than our beliefs shaping our action choices. We are reshaping the world itself.

How we approach changing our beliefs - or if we even bother to spend time trying to do so - depends on what we think they "are", in this sense. Personally, I think the word "belief" is near to useless, since it is poorly defined and tends to conflate these two things - and more. It is better to avoid it completely and go for a metaphor that is cleaner and has less baggage, and derive our own targeted language from that.

If we think of ourselves as a lense that views the world our beliefs could be the mud or dirt on the lens.

That's not a bad metaphor, and points to the distinction I was making, perhaps. Dirt on the lens doesn't prevent you taking a particular action in principle. However it affects the likelihood of you conceiving of and then taking that action.

If we believe that we are 'unattractive' then we are. Simple.

Now, this is where I think that, practically speaking, it's useful to separate out those two things. It may be possible for the world-fact to be that you are beautiful, but the thought-fact to be that you are not. The two do not necessarily line up. Dimensional jumping, as usually outlined, could involve changing the thought-fact or changing the world-fact. The former would change your behaviour, but not necessarily the reaction. The process is the same, however the intention (the "pattern" that is intensified) is different. However, there is some overlap, because people often approach doing one or the other by using an intentional pattern or image which actually represents part of the other. (Again, why I'm keen to make the distinction.)

We 'jump' realities all the time, by simply choosing something. Usually our beliefs keep us in a certain pattern of choosing so we stay within the same reality.

See, for me, this is where things break down or getting confusing. Having the experience of choosing isn't the same as shifting state - which is what I would call "changing your reality" - so choosing alone isn't what we're after. What we actually want is to intend a change of fact. Sometimes we accidentally link a change of fact to an action (assignment of meaning, "doing this means-that that is now true") but mostly our actions arise without any such link, and therefore do not change anything. This is why sometimes changing a belief (your thought about the world) simply changes the fact of your thought and perhaps your likely actions, and why other times it changes the fact of the world. Only when we alter a belief while having, perhaps without realising it, decided that doing so means-that the world will change, does a change in "reality" occur.

I don't think I've said this very clearly at all, so I'm going to try and summarise what might be a streamlined view:

- The world is a pattern, a list of facts of the world, which arises as sensory experience.
- Beliefs are a pattern, a list of facts about the world, a parallel construction, arising as a strand of thought.
- Changing a pattern is done by intending the change:
 - a) Changing a fact of belief will alter what thoughts arise in your awareness as your ideas about the world, and hence guide what you think is possible, hence what you might subsequently intend.
 - b) Changing a fact of the world, meanwhile, will alter what sensory experiences arise in your awareness as the world itself - what events will apparently occur around you including your spontaneous body actions.
- Since we can do b, then there's actually no need for a. At worst, we should spend some time intensifying the fact of "believing that b is possible" as some sort of broad meta-belief, and then we don't need to worry about any other beliefs at all.

TL;DR: Beliefs don't actually affect what is possible, so perhaps we don't need to worry about them at all?

your trying to change your physical world in hopes that it will change your inner world

Really, I am starting from the viewpoint that there is no inner or outer. In other words, everything arises in "mind", which has no boundary. (It's fairly easy to confirm this directly.)

From this, what we might call the "physical world" is just one particular strand of experience arising in that mind. We might consider this as a "3D-immersive strand of thought" that fills up our awareness. In parallel, also arising in mind, we might have a stand of experience which is our "thoughts about the world". Two strands, both internal and accessible, one arising from the world-state, one arising from the person-state. If changing our beliefs corresponds to a change in the person-state, then it might lead to a change in what we are likely to intend as a change in the main experience - because we have changed the structure of the "person" part of our experience. However, alternatively, we can simply intend directly onto the main experience itself - the "world" part of our experience.

Basically, I'm suggesting that playing with beliefs, while it can be ultimately beneficial, might be somewhat of a distraction, since it operates in a roundabout way and the meaning of "beliefs" isn't clearly linked to the structure of experience. If it's all internal, then we can simply assert facts directly. Don't "believe" that you are attractive, instead directly access the fact and make it true via intention. Again: operate on the world directly. There is overlap here, since if someone works on their belief of attractiveness then they might actually end up using an intention which asserts the fact - but not necessarily. You can end up having lots of thoughts about being amazing, but not actually being amazing, because you intended new beliefs, not new facts.

Related idea: Why aren't you a precog? When you think about what's going to happen tomorrow, what you believe is going to happen tomorrow, why does it tend not to correspond to what actually happens tomorrow?

If you don't believe something will happen then it most likely won't.

Why, though? How exactly do beliefs change what is likely to happen? It seems that there is a missing step in that description?

What is a precog?

Typically in science fiction, someone who has "precognitive abilities" - they can see into the future. I was suggesting (just as a playful idea to explore) that if it was our beliefs that defined the world, then surely we would be able to access the future, since it would simply follow from our beliefs. This suggests that beliefs are just ideas about the world. To be a precog, we would want to access the facts of the world, the current world-state.

if you don't have a belief that you are a certain way then you can't intent for it to happen.

I don't agree. If you can think of something, then you can intend it, since "an intention" is the thought of something being true, and "intending" is the intensification of that thought. Believing that you are a certain way doesn't limit your ability to intend otherwise, although believing that you are a certain way and that it cannot be changed might mean you don't end up trying. Beliefs are like a model of the world - a parallel construction in thought. Sure, if you use the model to judge what is possible and act/intend only according to what it says, then you'll be limited. Alternatively, you can just ignore it and intend what you want anyway, because the model itself has no causal or restrictive power!

Spending time changing beliefs is just time misspent - all you're doing is using the same intention process that you'll use later to change the world, to just change how you feel, so that you then feel confident enough to intend changing the world. You don't need that stepping stone, though. In the end, the only thing that really changes a belief is the generation of and experience which contradicts your model. So why not go straight for intending a change in contradiction to the model? (That's kinda what the two glasses exercise, etc, are about.)

This is where "faith" comes in. Faith to intend something contrary to your ideas about the world - and faith to not interfere with that intention subsequently, and to see where it leads. Faith being perhaps the only way to get to the meta-belief to rule them all...

Where that leads to is, I suggest: that intention is the only process that there is, the only operation that ever occurs. Beliefs aren't the "core operating system" of your mind - they're just another static pattern. The world is a patterned landscape of static facts which gives rise to experience; intention is how you change the landscape; there's nothing else.

I see what your saying. An intention creates action, where a belief is more static. So if you want to change your world then intend for it to be so and the beliefs will follow.

Yes. So I'd phrase it more generally perhaps, and say: intention creates experiences, of body movements but also of events. (Remembering that all of your sensory experiences arise in your "mind space", so the car horn "over there" is just as much a part of you-the-experiencer as your foot tapping "over here".)

A change in your beliefs then follows naturally from those experiences. You do not need to believe something in order to intend it and have it happen - however, you must at least have the confidence or detachment to resist interfering, since that will be a re-intention. You can think of each deliberate intention as shifting you onto a new deterministic path, a new sequence of experiences, which then unfold "by themselves" in your awareness, until you re-intend again. Between intentions, the world is "static" in the sense of being like a fixed logical landscape of experiences that you are scanning your attention across. So, "dimensional jumping" is a metaphor for an intentional change of this landscape, one which shifts it so dramatically that your subsequent experiences are "as if" you had changed to a different universe.

...

And then it would take a tremendous amount of energy on your part to stretch your energetic field and body that much.

These are some beliefs worth examining, of instance. What is this "energy" stuff, what's my "energetic field" exactly, and how does it relate to my body? In fact, that is my "body" - is it an object, or a collection of sensations which arise in my experience plus a conceptual framework that I've attached to them? And so on.

POST: The Mirror method is a trick of your mind

That is, I would say, sort of missing the point? That mirror-staring can be used to shift consciousness state is well-known and is an old technique. It's what you do with that, is what's interesting, I would imagine. (Whether it has to do with "dimensional jumping" or not probably depends on what you think "dimensional jumping" actually is.)

For further reading to add to those links, see also this post and links: Darkroom Vision & Chef Hats & Dreams

(Not advocating the mirror thing here, but) the point would be that entering an altered state of consciousness would not itself be "jumping" anyway. That would just be an experience you had while looking in a mirror. "Jumping" would involve witnessing a subsequent change in the world in line with the intention you had while entering that altered state of consciousness. The link was to suggest that our ongoing experience is a "mind trick" anyway, and that the content of that experience isn't necessarily important when it comes to a technique (other than perhaps confirming you had entered an altered state, if that's what you wanted to do).

We might ask, I suppose: what is an "altered state of consciousness", anyway? The phrase doesn't really explain anything, other than saying "this experience = that name".

Science is great. But we have to remember what science actually is: a catalogue of a certain subset of apparently intersubjective experiences, plus conceptual frameworks - "connective fictions" - which are used to link together certain elements of those experiences. So long as we don't confuse those descriptions with being "what is true", so long as we don't reify our abstractions, then it's an incredibly useful approach. However, if we forget that and confuse a particular set of concepts with "science" and with "what is", then we will start to think that the our invented concepts define what it is possible to observe, rather than our observations acting as inspiration for useful concepts.

Many people who aren't in the business (and some who are) claim to "love science" when what they really mean is that they are enamoured of certain ideas some people have come up with - sort of "science fiction" in a more literal sense - and incorrectly treat them as being true "out there", causing things to happen. Perhaps they really mean they "love the illusion of certainty that misunderstanding or self-deception can bring". (EDIT: "Dogma" would probably be a better term to use.)

and thus make a "dimensional jump", which really is nothing but a metaphor that describes the experience, perhaps not the physical rules themselves.

All descriptions are metaphors - experience is primary - so it's really a case of what's useful.

...

I love how TG completed dominated this discussion 😊

He does go on a bit though, that TG guy, I've noticed. He needs to hire an editor or something. ;-)

POST: Question, Opinions?

The reason I hate this subreddit is it doesn't treat the concept with respect...

I think the sidebar and related posts are pretty clear on what the deal is? People actually have to read them, of course.

The problem with "magic and the occult" is that, plainly put, it's full of its own set - actually multiple sets - of accumulated bullshit. Now, there's loads of useful stuff for inspiration, but a lot of it does lead people to take concepts and rituals as literally true. Even chaos magick suffers from taking its meta-approach as affecting something that is independently real. Basically, there's a lack of an underlying philosophy and this leads to confusion and superstition, especially for the everyday reader who just wants to find out what's really going on (ahem!), or how to solve a problem. This subreddit, meanwhile, takes direct experience as its starting point, and treats everything else as "active metaphors" or "patterning" - not even that, in fact. Not only are "dimensions" not treated as fundamentally true, neither is "the world". You are conscious, you have experiences that appear within you - that's it. There isn't "literal" anything.

confuses people who are "role-playing".

Who's role-playing? And why would they be confused?

Q1: *Not only are "dimensions" not treated as fundamentally true, neither is "the world". You are conscious, you have experiences that appear within you - that's it. There isn't "literal" anything.*

This is the foundation from which to begin. It's too "slippery", too security-challenging to deal with at the very beginning. It can even be a very off-putting, scary or

sacreligious idea - "Nothing out there?? What?!" It's necessary to work one's way to this in steps. Then, suddenly, the light shines. (You will know the Truth, and the Truth will set you free.) !! <3 Five million hearts to TG. (My cats maintain their changes, by the way.) :)

Cats are the pioneers!

POST: It feels like jumping doesn't work anymore

Q1: I've never been a fan of the Owl technique as that's basically Baader-Meinhof/frequency illusion. With owls it's especially effective as it seems to be a pervading decor/design influence these days. If I tell you to make a note of the number 18, for example, you'll start seeing it a few times a day.

Well, you can choose anything, it's only by repetition that the point is there, and choosing something more unlikely perhaps. The idea is that eventually you notice that, it's not exactly pattern searching from a pre-existing environment as such. They are called the Owls of Eternity for a reason. But of course, people's milage may vary and it's how things play out for you. At the time "owls" were chosen as the pattern, they were not a particularly pervasive decor/design influence - they were chosen for their relative lack of presence in daily life.

Q1: You can certainly choose anything however I'd be willing to bet money that should the element you pay attention be say, wombats vs. owls, you wouldn't notice as many. Owls are and have been a mainstay of hipster culture for a while now (I remember them over 5 yrs back) to the point where people get ironic tattoos of them. Heck. even Justin Bieber has a tat of one.

Ah, but has it always been true that they have been a mainstay of hipster culture for 5 years??

Joking aside, since it's ideally about something that isn't dominating your life currently, then if owls are common for someone, it makes sense to pick something else. You can never really separate it out from the idea of noticing things that are there anyway, but that's really part of the contemplation aspect - a call to consider that very thing - and perhaps discover that the experience of doing so pushes it somewhat "unreasonably". Again, it's really about leading yourself to think about the question: "Experiences are a pattern selection from what, exactly?"

Q2: yes. Also called "selective awareness".

For sure. Although we might ask ourselves: selective awareness from what?

Q2: ...from all the other input the pattern-recognition software doesn't pick up and filters out. If you connotate "meaning" to anything - it will pop up more often in your daily life. That's also how propaganda in the news works: See that guy that looks middle-eastern? Probably a terrorist - since your brain links terrorist with this sort of appearance. That's why you shouldn't watch TV. If you want to see owls, you'll see owls.

The propaganda example is slightly different, I'd say. I'd call that associative triggering of an "internal" extended pattern of meaning by an element, rather than pattern selection of an element from a pre-existing "external" environment. It's a step further along.

So, if you'd been brought up to think of owls and related birds as terrorists (for example), then you might report "seeing more terrorists", but that's not the same as "seeing more owls". When I asked "selective awareness from what?", I was thinking about the fact that we only ever have a post-selection experience in the senses, we never experience the pre-selection environment. This might lead us to wonder, what is the nature of that "source" environment?

We might assume, as is common, that it is a stable "spatially-extended place unfolding in time". However, aren't we then ignoring the possibility that 3D-space is itself a selection pattern, filtering from a larger environment? Perhaps the environment from which we select our experiences is more like an "infinite gloop" than a place. In other words, perhaps all of experience is "selective awareness". In which case, we see owls not because we are selecting pre-existing owls from our spatial environment, but because we are selecting pre-existing owl-experiences from a set of all possible experiences.

feel the space around you <> feel the air around your body

This is a good example, and speaks to the underlying question, which is about the nature of experiencing, rather than the content of experiencing. Although you don't need to meditate to notice this, some sort of pause-and-contemplate is helpful in realising that your experience of yourself is something like an "open aware perceptual space" in which sensory experiences arise. As in, directly know this to be true, rather than just think about it. And from there, as you point out, one is better able to make an informed choice about things, to deliberately select their own patterning, rather than simply have experiences unfold in alignment with whatever state you've accidentally ended up in. As for the "raw experience", which would correspond to no particular "sensory slice" being selected from the "infinite gloop", I quite like this account for giving a sense of it: Victor C: Other NDE Type Experiences [https://web.archive.org/web/20120606184332/http://www.nderf.org/NDERF/NDE_Experiences/victor_c_other.htm]

As to the objective reality thing, it comes down to where the line is drawn between "my patterning" and "the world":

- At one end, "the world" is a three dimensional place and is of the same formatting as my sensory experience, and I'm just noticing some stuff and not other stuff.
- At the other end, "the world" is an "infinite gloop" of all possible patterns, and there is no solid underlying limit at all to what I can experience. In that case, my patterning effectively is the definition of the world, and it's not that my formatting happens to coincide with the world's formatting - rather, they are identical and the same thing.

The tricky bit, of course, is that it's impossible to tell the difference between the two by simple inspection, because we will only ever experience our own patterning, the world filtered through it. However, we might perhaps work to reshape our filter and see at what point doing so no longer brings about changes in experience. That would be the solid underlying substrate, the "objective world". Exploring this is what this subreddit is really about. Experience is primary. If we actively test our assumptions about how the world really is beyond the format of the senses, do they hold up? Or can we in fact push through them?

Meanwhile, in another conversation, we wondered whether it would be possible to intend into existence a can of Ubik™, a product which itself dispenses existence...

Finally, I'd suggest that consciousness can't be measured, because "measurement" is something that arises within consciousness, is "made from" it. Current favourite metaphor: You can never make a sandcastle which captures the meaning of "sand" not of "the beach". You can only make sandcastles which correspond to other sandcastles, and even then only in certain respects. Consciousness, in this metaphor, is both the sand and the beach.

Finally #2, science and physics correspond to a catalogue of sensory observations (sandcastles), those with regular and repeatable aspects, and a collection of conceptual frameworks (parallel-constructed sandcastles in thought) which describe those aspects via "connective fictions". Science comes after observation, and hence after creation. It's a formal method of describing what has been seen, rather than establishing what is true.

Snappy summary:

- Observations dictate the valid or possible models.
- Models do not dictate the valid or possible observations.

Q2: Exploring this is what this subreddit is really about. Experience is primary. If we actively test our assumptions about how the world really is beyond the format of the senses, do they hold up? Or can we in fact push through them? To me this is the essence of occult studies. Or atleast what I find attractive about it. Dimensional Jumping is just a "system" or syntax one can use to help bring about these changes in our filters and therefor reality. I love the sand metaphor. Good stuff.

Agreed. Unfortunately, the term "occult" has become somewhat damaged I think, with all sorts of unhelpful associations. In its raw meaning - "hidden" - it makes sense: we are dealing with the non-sensory aspect of things, the background "state" that is what we are and from which sensory experiences arise. Hidden as in literally "not seen". So I prefer to think of this exploration as, I dunno, an active exploration of metaphysics with regards to the shaping of experience. Hence the idea of "active metaphors", whose

adoption patterns one's state in alignment with their structure, so that subsequent experiences arise "as if" they were true. In other words: The Patterning of Experience.

Q2: All the different systems that are exploring "the hidden" (Eastern & Western Magic, Religions, Parts of Psychology) are bringing their own synthax. I sometimes wonder if there are actual whitepapers on this subject matter - but I don't even know which syntax I would use to write OR describe the study.
Very interesting thought on the "adoption of patterns" and truenes. One can chew through a book and "feel" it's effects. One starts to adapt the ideas and patterns learned from the book and projects them into the own reality tunnel. Exploring metaphysics is therefore something highly subjective when it comes to the left-brain, analytical explanation of the matter. Many texts describe the same stuff. The stuff that makes up everything outside of a fixed and unified syntax or coherent pattern - but still connects everything.
This raises the question for me if it's even possible to do so or if it is needed at all. The answers in the end have to be felt and experienced by oneself.

Yes, so there are many ways of saying the same thing, but they are not necessarily compatible. The ultimate truth of the matter itself has no syntax because it is "before" division. So I'd say that it cannot be thought, the fundamental truth, in the sense of being thought about, because of course the "state" is a single continuous pattern. It is your actual experience right now, which is "one". And to think about it would involve separating from it and surrounding it, which is not possible. To think about something (construct sandcastles) requires that it be divided into parts, or building blocks, and then have those parts related to one another in mental space. Therefore it's not possible to think about that which thought is made from, but neither is it possible to think about one structure of thought using another, if they use different building blocks. Particular building blocks allow you to build some sorts of sandcastle, but not others. And to someone who grew up in one sandcastle, with one sort of building block, other sandcastles made from other types of block would be complete nonsense, totally insane, even though they were just as coherent and self-consistent and "true" within themselves and true ultimately.

So, we end up with a situation where we cannot understand other sandcastles from the perspective of this one - the only way is to expose ourselves to that structure and allow ourselves to be patterned by it, and thereby establish the forms that allow it to make sense. We must become it. And that we cannot understand the ultimate nature because it is "before" understanding - we can only be it. The great secret, of course, is that we always are it anyway. We are always "that which is and which takes on the shape of experiences", regardless of the particular shape or state we have adopted. This again speaks to our point: you cannot get outside of yourself in order to observe this truth, you can only deduce it by adopting lots of different shapes and realising there is no limit - in the same way you can only establish that there is no limit to experiencing by intending lots of different experiences. The only way to prove that you can be anything (because you are not anything in particular) - i.e. you consist of an infinite set - is to challenge your boundary assumptions by attempting to push through them.

And to push through them, there is no path or technique as such - you have to simply assert a new pattern, in order to deliberately re-pattern yourself, and thereby make that new pattern "true". Hence the benefit faith and commitment when it comes to this stuff, even when the present sensory experience seems to conflict with what you are intending.

I feel like it's already pretty interesting by simply committing to observe what is happening to yourself every day or make it a habit to reflect on how you changed [\[https://youtu.be/d1UgUEbBmDE\]](https://youtu.be/d1UgUEbBmDE) in regards to your environment, current emotions, stuff that bothers you etc...

Yes, I think just "being the background" and observing things rise and fall is important, and the starting point for everything else. If you can't "cease and stop generating interference" then you are likely going to be lost in reaction to content, rather than recognise yourself as the context.

POST: Like a Balloon - Become lighter than your 'surroundings'

[POST]

Balloon :

A Balloon being Lighter than the air around it is a good symbol for Reality Shifting. It has the ability to move up the dimensions. Become lighter in order to ascend quicker. Drop the baggage that doesn't belong to you, drop that weight, and things will speed up for you. Lighten-Up to get Enlightened. Reality is only a reflection of what you are 'holding on to'. Also, to extend the metaphor, when you fly in a plane, you are charged for excess baggage'. (So Like the Balloon play with the idea of **Becoming Lighter than your 'Surroundings'** and thus slipstreaming yourself up through realities closer and closer to your highest Joy, symbolized by the yellow Sun.) Which as a spiritual journey is a direction more than a destination.

[END OF POST]

Q1: I don't think what we do with the 2 glasses and mirror is truly dimensional jumping. believe dimensional jumps happen - I've seen it happen collectively ... but what we do with the 2 glasses and mirror is what people call magick .. it's "work" ... intention... manifestation ... I think most of it happens and is outside of dimensional shifting.

Well, as someone else pointed out, it all amounts to the same thing: a change or a discontinuity in your ongoing experience. It's the degree of discontinuity that dictates which label or metaphor we tend to apply. There is no "outside view" from which to assess it (and that includes experiences which are "as if" viewed from an outside, since that experience is also inside). Wake up one day and you see owls everywhere after intending them? Patterning. Wake up one day and that girl you like calls you for a date after you did an exercise? Magick. Wake up one day and your house has changed colour? Reality shifting. Wake up one day and you're in a different house in a different city with a different wife? Dimensional jumping. Really, it's all just the "patterning" of experience.

So I say: use whatever concepts are useful to you, but don't get hung up on "what is really happening", because the more you experiment, the more it seems that there is no fundamental "what is really happening" other than: you are something-which-has-experiences and those experiences are "as if" some things are true (until they are not). Right now you just happen to be having the experience of being-a-world-from-the-perspective-of-a-person.

Q2: Thanks, dude. You're awesome and I love your subs and posts and stuff, but sometimes you lose me with all your big words and heady concepts-- and I'm not that stupid a person. Have actually been wishing lately that you'd use a little more lay-speak, and boom here you are. Two thumbs up.

Yeah, it's definitely good to reign in the vocabulary now and again. What tends to happen is that it ebbs and flows - you start off with the "flabby" version of an idea and then a dozen conversations later you've streamlined it and made it more understandable. But then you bolt something else onto that, and the whole thing starts again...

...

"Inflate himself, just like a balloon" - apparently [<https://www.youtube.com/watch?v=RcP91tQ4ZSM>].

POST: Would anyone be willing to talk about their dimension jumping experience(s) on a radio show?

A good starting point before agreeing to an interview about this, is to ask the potential interviewer:

- "What is your understanding of 'dimensional jumping' at the moment?"

Based on that answer, you can tell whether you are in good hands or not. In other words, whether it's a "check out this crazy shit" type of a deal, or if it's going to be a more considered, philosophical exchange which has had a bit of thought put into it. Not that everyone needs to have read George Berkeley's Three Dialogues or Immanuel Kant's musings in order to have a good discussion, but it's probably a waste of time having a conversation about this unless there is some prior background or interest in pondering "the nature and formatting of experiencing" - because without a proper context all this stuff seems apparently nonsensical. But, y'know, it's for everyone to decide for themselves whether this would be an appropriate channel for all your dimensional jumping conversational needs; it might still be fun maybe possibly.

Just to interject quickly:

I suppose any opposition to the approaches discussed on this subreddit would be a key talking point, but obviously this would depend on the answer to my first question.

To my mind, this is immediately an error (in this context). To anticipate building a show around opposing viewpoints - basically, to construct a controversy - prior to there being any viewpoints, surely highlights that this is the wrong approach here? "We'll find out what these guys think and then find someone who thinks the opposite."

It's a well-worn and uninspiring format, I tend to think, when the topic is one that needs background, rather than being an argument about a social issue or whatever. I generally much prefer shows and podcasts which are more collaborative and therefore informative - "We've got these people on, let's find out all about their topic and their view of the world, being sure to pick up on anything which seems unclear or incoherent". This is particularly true of subjects like this one, which isn't really about holding a belief or opinion. Primarily, it's about investigating your experience without completely aligning to any particular view. So there is no position to defend, necessarily, as such. However, it would be interesting to get a selection of people on who have different angles on the central concept - the nature of reality and how to explore it and conceive of it - as opposed to, um, trying to select opposing viewpoints without having an advance understanding of those viewpoints. Anyway, here are a few underlying ideas off the top of my head (others might disagree):

- Our descriptions of the world are not the world-as-it-is. They are parallel constructions in thought.
- The experiences you have dictate the descriptions which are valid or possible, but the descriptions you adopt do not dictate the experiences which are valid or possible. (However there may be an exception to this.)
- There is a distinction to be made between fundamental truth (the nature or context of experience) and relative truth (the content of experience).
- By performing experiments we can differentiate between these categories, and apply the results in useful ways.

So basically: investigating the nature of your personal experience, and as a byproduct perhaps generating useful results in addition to information. Which aspect of that people are attracted to more, is up to them. A "dimension" in this context, is the current state that you are in (at least, according to one of a number of different metaphorical descriptions of the nature of experience). However, this doesn't mean that you are a person in a world that is in a particular state; it means that you-as-experiencer are in a particular state, which is prior to your actual sensory experiences of being-a-person-in-a-world.

Yeah, I know. So it's probably worth reading the sidebar and the stuff linked from there, and actually playing with this a bit, I would say. I mean, you can just play around with the demo exercises and see what happens instead, but those are just the starting point for exploration and contemplation really.

I appreciate your preference in media and share a similar enjoyment for informative content but feel that just because a forum contains two differing viewpoints it does not mean it can't offer the listener an opportunity to learn.

My point was more that you were looking to set up a for-against dynamic for your show, without really knowing what the "for" would be! How are you going to have two differing viewpoints, when the topic isn't viewpoint- or belief-based as such? Of course, it could be reframed in the sense of "who's the most useful philosopher?" or "is such-and-such possible?", but my gut feeling is that it doesn't apply. Note that it wasn't really a criticism or concern as such, more a personal perspective on what I think works better with certain topics. (I tend to think that the now-default adoption of the "report the controversy" or "set up an objective frame" approaches, independent of the nature of the topic, has rendered a lot of topic-based mainstream journalism and interviews largely worthless.)

So - not a direct criticism of your take, I hope you realise.

Perhaps the uninitiated person might disagree with your viewpoints which would result in a compelling discussion.

Certainly that's a more promising starting point. How to pitch it though? Since the focus is on attending to your personal experience as it is, and trying something out and judging the results for yourself, the underlying viewpoint is sort of a "meta-viewpoint". In effect, the attitude is that there is no fundamental "how things work". I suppose that in itself is something that can be discussed. But even that is no more than a potentially useful viewpoint; it is not claimed to be "true". (You might just end up with people arguing that they experienced something vs they didn't experience something.)

So essentially (and please correct my mistakes) 'dimensional jumping' is a mindset that assists you in viewing the world in a less 'traditional' sense and therefore brings you closer to attaining your goals. Would that be fair to say?

I would rephrase it perhaps: that "dimensional jumping" is a mindset whereby you do not take for granted that the 'traditional' or common description of the world is true - although one does not have to reject it either - and are thus free to examine approaches and descriptions on usefulness alone. Something like that.

Perhaps I'm taking posts too literally but when users such as this talk about aspects of their life changing after 'jumping' are they speaking metaphorically or are they suggesting they 'jumped' and they now exist in another 'dimension'?

It's captured in the sidebar really. There's the exercises, and there's the general notion of using metaphors to conceive of and to describe change. So a "dimension" is a metaphor, but only in the sense that "the world" or "youtalktv" is a metaphor. We infer our current situation in terms of concepts, based on our experiences. If something dramatic changed in your experience, something which was akin to an underlying fact-of-the-world changing without your direct intervention, you might conceptualise that as being "as if" you had changed worlds or jumped dimensions.

In other words, it's a descriptive framework. What actually "happened" is: you were experiencing "this" and then you experienced "that". Everything else is metaphor and narrative. That applies not just to this example, though; everything that isn't direct sensory experience is in effect a connective fiction to some extent. Leading to...

The real question is: what is the relationship between our connective fictions and how-things-are-really (even though that is itself a concept)?

Having said all that - for sure, most people just try out the exercises and, perhaps, find that they get results. If they get results, and they are interested in investigating further, they might try repeating this and more ambitiously, to confirm there is something to it rather than mere coincidence - and perhaps contemplate what that means. Regardless, the description of "what happened" will be secondary to the experience, and is not "what really happened".

Putting all that aside for the moment, if I were doing a show where I was just talking to people who had tried experimenting with this stuff, while trying to avoid getting too abstract, I might separate it into:

- The experiences people report having had.
- How people "explain" the experiences people have had.

You could then have the usual discussions about coincidence, confirmation bias and so on (the first stops for accounting for unusual experiences), then if that followed through, something about the nature of experience and of how we account for its content using descriptions. The difficulty would be to avoid getting trapped in a "he said, she said" argument about the meaning of the experiences themselves, particularly if it's not possible to spend a little bit of time discussing some philosophical points. It can be like trying to discuss "sandcastles" without having first explained "beaches" and "sand". (And even then, without the direct experience those concepts have little value in and of themselves.)

EDIT: Added some headings to make this less of a block of text.

"Are the experiences literal?"

I think my key question is, putting all mindset approaches other than the physical techniques listed, are the experiences accounted in this subreddit literal?

The experiences themselves are literal, as in the person had the experience of those events happening. But any account in terms of a "state" or a "dimension" is just part of a conceptual framework, a descriptive narrative. This is fundamental:

The content of the experience is primary; the narrative is secondary.

The narrative provides a way of thinking about the experience, and perhaps acts as a source of creative inspiration too for possible approaches - but it is not "what really happened". But that's not new, of course. This is, not quite, in much the same way as "gravity" does not cause things to fall down - rather, "gravity" is the name of a description about things falling down (loosely speaking). Similarly, "the subconscious" is not really the source of mental events, it is a concept we use to form a connective narrative about mental events. And so on. The difference here (with the topic of this subreddit), is that the number of "observational touch-points" associated with descriptions of these experiences description is vastly reduced, since we are dealing with one-off events often, and the experience is a certain subset of the subjective rather than being pseudo-objective.

Experiences, Results & Explorations

For example, the use of the numbered hex headers is to confirm that a user has indeed altered their worldly 'state' to one where identifiable aspects differ to the 'state' they were 'in' previously?

Well, not really. The number is a bit of fun. For sure, if someone had the experience of the number changing then they'd definitely know something was up! But as the sidebar says, it's an "emblem of change" and potential.

This is a very interesting point. So you would argue that the majority of users find the practice of these methods more attractive than the end result?

In my personal view, the purpose of playing with this is to widen one's thinking about the nature of the world, and so on. If you get a result that seems, well, unlikely, then hopefully that might trigger a bit of thought as to how, exactly that result came about. Of course, that's down to the person themselves. They could quite equally just do it for a result. However, the framing of the subreddit is very much of this being an exploration rather than a set of techniques or a singular worldview.

'Beliefs' & Analogies

I like the sandcastle analogy and strongly agree that it would be necessary to provide a foundation of these 'beliefs' before delving into a person's experiences.

I think that's key, definitely. Although again, I'd emphasise that the only "belief" would be one that arose from having had personal experiences - i.e. the belief would be that there was something interesting going on. Otherwise (another analogy incoming) it would be like having two people have a discussion about "the nature of the night sky", one of whom had spent their evenings looking through one of those new-fangled telescopes, and one who hadn't. You can discuss the meaning of observations, for sure, but only if you have actually made the observations - looked through the telescope. To mix it up further: it's always fun to discuss a carefully-drawn map, but there's not much point in discussion the accuracy of maps if you haven't done some walking in the area depicted - or worse, if one person is referring to an shipping map while another is referring to a flight map.

He Said, She Said & Beyond Common Sense

Unfortunately the discussion would almost certainly fall into some sense of "he said/she said" simply due to the nature of said experience.

Which could be a bit pointless, potentially, because nobody is suggesting here that a particular set of facts are true - there is no position to defend. As the sidebar emphasises, it's about trying out a couple of things and seeing what the results are, to see if there is "anything going on". There is no belief system being advocated; merely useful or interesting ways to think about experience.

As you say, it'd be important not to get bogged down with this and certainly to take each instance on face value and analyse it with a fair and common-sense approach...

The stumbling block is that face value and common-sense might themselves be a problem, I suppose. There is no independently-existing "face value" or "common-sense" that is separate from an implied philosophical stance, and it is not always possible to translate something from one to the other. Sometimes you need to build from the foundation up, and make an independent self-consistent "sandcastle", albeit on the same beach and still made from sand.

To expand:

Really, this is just about pushing against our assumptions about the world and ourselves, to see if they are accurate. More than that, it's about pushing against our background assumption that our usual thoughts-about the world - or indeed any such thinking - is equivalent to the-world-as-it-is. How much of the stability and structure of my ongoing experience is due to "the world" and how much due to "my mind"?

So. We do some exercises to explore these assumptions, by perhaps blindly trying to do obtain some results that would not logically follow from our habitual narrative, and we play with constructing alternative coherent narratives and seeing if actions based upon those yield results.

For example:

Kant suggested long ago that the world-as-it-is is not formatted in terms of spatial extent and unfolding change (space and time), rather it is our human perception that is formatted this way. Furthermore, our thoughts-about the world really have very little to do with the world itself - they are "parallel constructions" in awareness - and are therefore not causal or limiting, except to the extent that they limit what we might choose as our intentions. It's not easy to have a discussion about these sorts of things in a "he said/she said" format, because one side won't be arguing about "facts" at all - they will be discussing the nature of facts, perhaps, and discussing experiences without really promoting any particular view of "what really happened"!

Disentangling Topics

I'm genuinely interested in how unusual topics which require niche background knowledge to fully explore, can be properly discussed in a way that's accessible to a wider audience, and is entertaining, without misrepresenting it. With something as experiential as this, though - with ideas that, although not entirely novel, are slightly counter to common-sense - it really is a challenge.

...

Good response.

I can't guarantee that your views won't be questioned or discussed with you.

Well, it would probably be a fairly boring show without that! :-)

To be clear, my comment wasn't intended to suggest that people should only go on shows where their views won't be explored and challenged - because those two things are what makes a discussion interesting and worthwhile. Rather, I was underlining that, because "dimensional jumping" is a bit of a loaded term, it's worth checking what someone understands by it, so that they know what to expect from the discussion. For example, if someone thinks that it's about "physically teleporting your body between multiverses that are all happening simultaneously", then that's probably not a good starting point. ("Dimensions" aren't places, as such.) Setting up a "skeptic vs believer" type show that presumes this as the underlying concept likely wouldn't work. In fact, the core of this subreddit probably involves being a non-believer in any particular conception of the world vs personal observation. Which does tend to make a discussion about it a little abstract and philosophical, if you go deeper. Perhaps not what you are looking for, depending on who you were anticipating using for the "skeptic" role.

Anyway, those are my thoughts!

TriumphantGeorge Compendium - Part 9

POST: Question regarding manifestation

since there's really no way that I can think of for me to solve it

Be wary of straying towards specifying the "apparent how" of the desired outcome here, perhaps. You don't actually "solve" the situation at all; you assert the fact of how you want things to be, and the solution arises from that as a spontaneous extended pattern. The idea of imagining the immersive scene is really to assert that that "moment" will be a fact. If that moment is a fact, then the property of continuity of the world implies that all the other moments must fall into line with that new fact. In other words, you yourself are not trying to come up with a story that you believe might happen; that takes care of itself.

The classic example being, you want a particular car. You imagine a scene of you being in such a car, feeling the feeling of being there and it being yours, thus intensifying that pattern as a contributor to your ongoing experience - making the fact of the existence of that moment true. You do not make up a little story about how you came to have the car, or any other circumstances surrounding it. You simply assert that the moment is true, and that pattern will be overlaid upon your world, in addition to the intentions and implications that you've already accumulated (with some being relatively diminished if they are contrary to your asserted outcome). You can prepare for worst-case scenarios if you feel you must - even though, in fact, you are best to simply deal with such things as they arise, since they won't ever quite correspond to your thinking of them - but do it briefly and don't dwell on it. Deliberate rumination is literally the intensification of the things you are thinking about, increasing the relative contribution of their patterns and implied facts upon your ongoing experience. While you shouldn't feel you have to battle passing thoughts (just let them pass), your deliberate, purposeful thinking should in general be focused on facts and scenes that you are happy to become more prominent in your life.

Again, to emphasise: You do not solve problems; you select and assert outcomes and the apparent path from here to there is spontaneously implied as an extended pattern, based on your accumulated intentions (and their implications) to date.

POST: Jumping for remission of mental illnesses

Good comments. For OP:

Just to emphasise: What you write down is not necessarily important, **it's the assigned meaning - the linked pattern - that is important.** We are not "sending messages to the universe". So it is fine to write "rich" provided that this is the word you are using to encapsulate something fairly specific.

There can be a tendency to avoid being too specific, actually, maybe out of a background fear that we might actually get exactly what we want. In the back of our minds, we are not sure we really do want the world to be revealed as malleable, perhaps? But since the underlying aim of the exercise is to experiment - to demonstrate that there is "something going on" - then there's not much point in it if the outcome is so vague that we won't be able to tell whether it happened or not!

Meanwhile, I like to avoid using the phrase "Baader-Meinhof phenomenon" [1] because it is usually employed in ways which imply that it is a "trick of the mind", without saying how exactly that works. In other words, it tends to assume that you are noticing things that were already there, and it's just that your attention was drawn to them (somehow). Now, it can be thought of in terms of pattern selection from a pre-existing environment, but the selection that occurs isn't necessarily like picking out "owls" from the 3D room you are (apparently) in - it might be more like picking out "owl-experiences" from an "infinite gloop". In fact, as we experiment with this, the latter seems like the more accurate characterisation.

[1] Our favourite topic. :-)

Q1: I don't know how relevant this is to this thread, but I wanted to give a recent example of how the "playful" YOU-niverse can work in our favor. In this case, I wasn't even trying to do anything. I was just "having fun" in my imagination. I'll start by saying I try to keep my "vibe" up as much as I can, but sometimes I don't do well at this, finding I've had days on end of mostly sad/negative focus. However, in my world I've found that the "faith as big as a mustard seed" concept is true, and that if I keep VERY positive even, say 10% of the time, my Inner Being does take notice and respond. "Playful" story: I was experiencing a general lack of funds, and trying to keep my spirits up. One day as I was walking, I thought about the saying, "Money doesn't grow on trees!!" I thought (playfully), "That's a lie. Money DOES grow on trees!" and had fun in my imagination walking up to small trees and just plucking off a \$10 bill and a 5\$ bill. I thought, there's no need to be greedy since I can walk up to ANY tree ANY time and just take what I need! I had HUGE FUN imagining this, and probably did it for at least 5 minutes. The next day, the thought came back to me - and I did it again....:) Then, I forgot about it. Within a week, I discovered I could buy many of the food items I need at a little store called...DOLLAR TREE that is near my home. Every item, no matter what it is, is \$1. I have purchased bagels, bread, cheese, pie, batteries(!) and even headache medicine there. I save so much money that the EFFECT is as if I have gone up to a "money tree" and plucked off \$30-40 every time I shop there. One could certainly say "Baader-Meinhof" since the store had already been there and I finally (I don't even recall how!) became aware that it had things I needed. I personally say I "made/took hold of" the Magic that is around us all the time. I wish I could stay in playful mode much, much more than I currently do.

Ha, that's nice, a little "money tree" pattern almost literally and in a fun playful way. And I do think that "playful imagination" is a very beneficial attitude, not just for generating outcomes, but simply for having a pleasant time in the moment.

Q1: I agree! I had no idea of generating anything but was just, frankly, giving myself a bit if fun and relief from my concerns. It became a terrific lesson for me. It illustrates, to me, anyway, one way what we call "detachment" can feel or present itself in that moment when the real "shift/creation" is occurring outside our conscious awareness. :)

It also points to the "dumb patterning system" that forms the basis of experience. If you intensify a pattern by deliberately attending to it, you will increase its contribution to your ongoing experience - regardless of your original purpose in doing so. (For sure, we use the term "intention" when referring to a more fully-specified pattern related to a desire, but its nature is identical.) There is no intelligence to it; there is no "universe" doing stuff on your behalf. It really is as basic as drawing N-dimensional scribbles on the "TV screen" of perception-awareness, and then encountering those scribbles overlaid upon subsequent moments.

...

A1: You missed the last step, which is carry on with your life!

POST: Jumping for remission of mental illnesses

Q: Can you elaborate more on how you connect depression (and anxiety?) To the body as unfolded experience. I tend to link depression and anxiety more to psychological factors than bodily. Also how come we can feel exposed and vulnerable with the initial changes of a jump (for depression and anxiety) when in fact every time I hit a clear state I feel such an emotional stability. It's messed up and understanding it maybe will help.

I wouldn't separate out bodily and psychological - everything you experience arises in your "aware space". Although you think of your body as being one "thing", your actual experience of it is a collection of disconnected sensations floating in "aware space", along with the visual image of the room your are "in", the sounds and textures, and so on. Your experience of "being anxious" and "being depressed" are also with that space. The "imagination room" is almost a literal description of how our ongoing moment is

structured. When depressed and anxious, I'd guess, you probably feel that "you" are contracted, like a small ball of attention in which your whole self tries to cram its way in, and highly constrained. This might be in the head area, perhaps towards the back, and you might feel on high alert and not properly stable on your feet - or you might feel more detached and your body feel separate and very heavy. There's no single experience.

However, the common thread is being "localised" rather than "expanded", and that making you feel, as you say, both exposed (a small dot in a large world) and vulnerable (no boundary vs the world). And when change starts to happen, we often feel even more exposed as your attentional boundary releases and opens up. Once that's happened, though, then we are the most stable we can be: open in all directions, self-balancing and stable, the world within us rather than against us. Hard to describe, obviously, but hopefully something in that description makes sense when it comes to your own experience of it.

From your other comment:

Lying on the floor definitely works wonders over time - particularly if you remember that you don't only "cease" limiting your body and thoughts, but also your attentional focus. You let all of them roam where they may, allowing them to unwind and complete and dissolve and open themselves out. This prevents any accumulation of restrictive focus or intention over time. Which leads us to:

What leads to tension and depression and anxiety in the first place?

I suggest that there is a common bad habit that may contribute to these (and which the daily releasing involved in lying down helps alleviate). That is: when performing tasks or participating in social interactions, rather than simply "intending" the outcome and allowing ourselves to respond spontaneously, we intend the manual control of attentional focus and bodily movement. This has the effect of both intending the outcome and intending tension and constriction of space. For example, while reading these words, have you narrowed your spatial focus down onto the the screen, like a little ray of focus, to "make" the reading happen? Similarly, when you get up from your chair, do you grab onto the sensations of your legs and then move them by operating the muscles? Both of those are sure-fire ways to build up tension, and if you end up with a very narrow focus over the long term, anxiety and depression type feelings are likely to follow.

Instead, one could sit back and "intend" being an open relaxed space, filling the room. Then "intend" to read the words on the screen without deliberately controlling your body or attentional focus at all. Just "let the reading happen". You'll find you can stay open and relaxed and the reading will occur. Then, when you stand up, once again allow your attention to remain open and, instead of moving your muscles by focusing on them, instead intend being stood up and stay with that intention, without refocusing on your sitting position. Stay open as your body gets up. Notice how much more relaxed and effortless that is.

So - that probably needs a bit of experimentation and exploration, but it is a way you can change your way of "being" on an ongoing basis, to great benefit. And if you do feel anxiety coming up, do not defend against it, rather think of it like a wave of sensation rippling across the pond of your awareness. Perhaps not pleasant, but by remaining open and not trying to control it, you allow it to pass across you and fade away. You may even find that it never reaches full intensity, since by remaining open it is never trapped within a small boundary - so it's like a ripple in an ocean rather than a splash in a glass of water. (Again, something to experiment with, to discover how it is for you, in particular.)

POST: Tell me your two-glass approach success stories, please.

Well, as you've probably noticed by now, the whole world seems to be able to fit inside your mind quite happily, so as long as the thing isn't bigger than the whole world, you're probably okay! ;-)

Or being even more to the point: all outcomes take the form of multi-sensory experiences in our perception, and no moment of experience is bigger than any other moment. Meanwhile, the "space" in which those experiences arise doesn't seem to have any edges, and therefore doesn't seem to have any "size". In other words, although a change might seem to be big from the viewpoint of content and its meaning, from the "meta" perspective of context it doesn't matter. No TV image is bigger than any other, and switching channels doesn't become more difficult just because the programmes on each are different genres. I wonder whether it would be useful to contemplate exactly what makes one thing "big" and another thing "small"?

I think it's definitely helpful to spend some time contemplating different "underlying formats" that experience could take, since they all imply different possibilities and probabilities (while still fitting in with your current sensory moment). That's where the notion of "active metaphors" comes in (see sidebar).

POST: Altering your reality questions/thoughts

For instance when I jump I take into account how my intended reality has imprinted on all possible observers.

So, to be clear maybe: Are you suggesting that you having the idea of there being other observers might make it difficult, because we conceive of some things as being "shared facts" rather than "personal facts", and imagine that this makes them harder to change? Or are you suggesting that there actually are other observers whose participation in the world makes it difficult?

The supporting question to ponder would be: Have you ever witnessed anything that wasn't your own observation, including the experience of seeing apparent other observers? Do we have any evidence that having the experience of perceiving "other people" can limit us in other aspects of our experience?

It's quite a common thing, the idea that we are in a consensual reality, a "shared place" where we all contribute to the overall set of facts. Can we be sure, though, that this isn't just something that our experience behaves "as if" it is true, because it's an idea we hold on to firmly (perhaps worried that the alternative is to let go of the notion of "other people" altogether)?

(Note: I'm answering this without having read the other replies - and I'm taking a slightly different angle than I might usually, to offer an alternative approach, which might seem a little oblique at first. Let's see where it leads. Added headings to make it clearer. Ran out of time for proof-reading, so apologies in advance.)

Other People Problem

The hardest thing I've come to terms with 'shifting reality' is how do the other people fit in?

It pretty much is the hardest thing, I think, but perhaps not for the reasons you suggest. Your language still, in effect, assumes the world to be a "spatially-extended place unfolding in time" as your starting point. The best starting point is probably to recognise the nature of our direct experience. Exercises such as the one described in this comment can help. That is what it is fundamentally true. Loosely, you are "that which is aware and takes on the shape of states and experiences". However, by experiences we mean "sensations, perceptions and thoughts", we don't mean that there is a world all laid out in space going on and on; rather, the world is more "dimensionlessly dissolved within you". So, that is what is fundamentally true. What you truly are, cannot be described in words, because it is "before" division and change and other formatting structures, but it is "aware" and it is what becomes other things. For convenience, we might described it as an "open aware space" which has no boundary.

Now, we move onto what we're currently engaged in: trying to reach an understanding, by describing things in worlds and thoughts. But we have to realise that all our thoughts about the world and ourselves are also within that "open aware space". The world is already a structure in awareness, any thoughts we have about the world are parallel structures. What we are is what everything is made from, so any thoughts about that are it but cannot describe it.

The Beach

A metaphor I quite like is of making sandcastles on an infinite beach. If one sandcastle is the world, as a pre-existing sandcastle, then trying to think about the world is to make a parallel sandcastle which is superficially similar in certain respects, but is not it. Then, thinking about the nature of the world and self is like trying to build a sandcastle which accurately represents both "the beach" and "sand. It cannot be done! However, ironically, the failed representation is both "the beach" and "sand". In this metaphor, your true nature is the beach. Now, in that model, where is the "external world"? It only exists as a constructed sandcastle. It might be a self-consistent sandcastle, but no matter how intricate and convincingly detailed that sandcastle is, it never represents the actual reality of the beach and of sand. One can only be beach/sand, once cannot think it nor can one observe it.

So, summarising: what we truly seem to be - by direct observation - is an "open aware unbounded space" within which experiences arise as "sensations, perceptions and thoughts". The world, then, is like a strand of experience, like a thought you are having, albeit a very bright, stable and 3D-immersive one. Thoughts about the world are parallel, and do not actually describe the world or the nature of experience. They are, in effect, separate worlds of their own.

All in the Mind

So are you implying that essentially the world we live in is actually all in our minds and that you, in fact, do not exist in my world?

It is not your mind; it is simply "mind". Mind taking on the shape of a particular state or world-pattern, hence taking on the shape of an experience. This means that "you", fundamentally speaking, aren't actually a person. You are just taking on a "person-shaped experience" at this moment - you are adopting the perceptive of an apparent person, but that includes taking on the shape of all other apparent people too. A bit like selecting frames from a stack of all possible movie frames. However, this sounds a bit "dead", but actually the entire thing is alive with the aliveness that is you; it's just not a personal aliveness because it comes "before" the experience of people. That aliveness is unbounded awareness, and since that is "before" division and change, there is only one awareness (which right now is taking on the shape of an experience of being-a-person-in-a-world). "Reality" in this view is static and eternal, the only thing that shifts is awareness itself as it adopts new shapes for experiences, from the field of all possible simultaneously-existing experiences.

But the table must physically exist, right?

What does that mean, though? What does it mean for something to be "physical"? Refer to what you are actually experiencing, rather than what you are thinking about the experience (because there are many different ways to do that). The table might be said to exist, but only in the sense that it is a "fact" or "pattern" that is persisting. It has no solidity other than that. (The feeling of solidity is just a sensation floating unmoored in awareness.)

Limited to Speculation

ultimately we can only ever speculate and form theories and metaphors to explain this universe.

It's not even that, though. It's that the truth of the matter is that the nature of things is "before" theories and metaphors. Our metaphors are just parallel constructions. You never get to a deep understanding through thought, because thought itself is "made from" the thing you are trying to understand. Only by considering the nature of your thinking and experiencing, can you realise how things actually are. It's like an extra "meta-level" that comes before everything else. Fundamental truth with everything else just being relative, self-referencing truth.

do you think that, including our perception, every other physical object in this universe is all in our heads?

Well, not in our "heads", because our "heads" are within our experiencing. But everything is within our awareness, sort of dissolved within it, I'd say, like a list of facts or patterns (fact-patterns). That is just a metaphor though, of course.

The Possibility of Limitations

Do you believe that all limitations are in our mind when it comes to shifting reality?

There's no underlying structure supporting our experience so - yes, in effect. Although there is no solid underlying substrate to experience, there is obviously structure to it - it is patterned. So changing your experience involves shifting the relative intensities of those fact-patterns. Since those fact-patterns are made from you-as-awareness, the only way to do that is to shift shape - that is, to shift our state or "jump dimensions" in the main metaphor. How do we do this? The only way is intention. Between intentions, we are merely experiencing the unfolding of a deterministic path inherent in our current state. If we want to change it, we must change the relative intensity of (that is, "intend") a pattern (the "intention"). There is no other power.

If I was truly devoid of any and all limitations, to the point that I was "barely human" and that I knew...

Well, your "human" aspect is part of the patterning of your current experience. You are not a human, fundamentally, but you are having a being-a-human experience. So long as you don't dissolve that patterning, then you will continue to have that perspective even as the world itself apparently changes. (Note also: people tend to worry that their "humanity" is what makes them good and moral, and that if they lost that they would become evil. Actually, the pattern is overlaid on top of awareness, and awareness is fundamentally a sort of good aliveness. Hence all the stuff about the universe being "love" and all that.)

...could I live in a fantasy world, the same way I am living now? It's bordering on psychosis at this point.

You already are living as a person in a fantasy world. To change to another fantasy world involves, essentially, changing the patterning of your current experience. Adopting a formatting or an active metaphor, one might conceive of this as switching from one 3D-immersive strand of thought about a world, to another one.

Summary

- Fundamentally, what you truly are is an "open awareness" whose only inherent property is being-aware, which has taken on the shape of a particular state and experience.
- You can directly experience this to be true. It is the only thing that is certain and fundamentally true.
- Your current experience is of being-a-person-in-a-world. Or more strictly speaking, being-a-world-from-the-perspective-of-a-person.
- The world is not a "spatially-extended place unfolding in time", although we might have experiences "as if" that were true. It is perhaps best described as a "world-pattern" which consists of a relative distribution of intensities of facts. These are relatively true.
- This "world-pattern" can be updated via intention. Only experimentation can prove this to yourself.
- The "world" overall might be better considered as a shared resource of possible experiential patterns rather than a shared place.
- There are other people, but they are part of the world-pattern. The person you are experiencing is also part of the world-pattern. The only intelligence or awareness is the one you are right now, taking on the shape of apparently being one of those people, but in effect being all of them.

To kick off, I absolutely agree that this is a difficult area to discuss. Basically, it just doesn't fit into language very well; we always end up circling the topic, pointing at it. As soon as you think or talk about it, you are in fact thinking or talking about something else - but as it. See the sandcastle metaphor, with its castles on and as "the beach" and also "sand", for example.

EDIT: This turned out to be a bit long, so I've divided it into two blocks. It meanders a little, but it means well. ;-)

PART ONE: Awareness & People

I realise that the only awareness you can prove the existence of is your own - but does it follow that the other people you experience in the world lack awareness?

The thing is, though, it's not your awareness. It's just "awareness", which is taking on the shape of an experience, the experience of being a person in a world, "as if" it were a person. So the awareness doesn't belong to the person; it's better to say that the "idea" of all people is within awareness - the "idea of a world" - and at this moment it has taken on, or unfolded, the sensory aspect of one part of that idea. So it wouldn't be that other people lack awareness; even you-as-person lacks awareness and is just a pattern. The only awareness, the only intelligence and causal agent, is you-as-awareness. If the content of experience shifted and took on the shape of some other person's perspective, it would still be the same you-as-awareness, but experiencing the sensory content from a different you-as-person perspective. At all times, though, you-as-awareness is in a state which corresponds to the implied pattern of the whole world, all people, laid out over all time, deterministically (until a shift occurs via intention, that is).

Are you saying that we merely can't prove other people have awareness or are you saying that we can be definitively certain that the only awareness in the world is our own...

I'm saying that the suggestion that any person "has awareness" is effectively meaningless - and that includes the person you are having an experience of being right now. Directly attending to your actual experience right now, you can observe immediately that "you" are everywhere, the entire experience is made from "you", that you are "awareness" - and that "you" have no edges and no outside. Furthermore, any thoughts you have about being a person or there being an outside also arise within that awareness, and that the experience of apparently being-a-person-in-a-world is effectively a strand of thought too. In other words, it turns out that you have to take a step back from content, and contemplate the context of that content. It turns out that one must reconsider what "you" are, and what "people" and "other people" are. In particular, we must note that there is no perspective other than a 1st-person perspective. As soon as we starting thinking about things from a 3rd-person perspective - employing a "view from nowhere" - then we are immediately wrong.

Additionally, all thoughts about experience are themselves experience. When we think about "the world", that is in effect another world, and not the world of our main experience. We confuse our thinking about the world with our thinking of the world.

...and that the capacity to alter the world/other people through consciously intending changes in the pattern proves/indicates this? Which would make you, from my perspective, a sort of automaton?

Better to say "a pattern laid out in time" or something like that. This is just because "automation", to me, implies a sort of programmed "happening", whereas it's probably better to use the metaphor of a landscape of 3D-immersive snapshots that is laid out before us, and which we traverse with out attention, moment by moment. The only thing "happening" is awareness unfolding moments in and out of sensory form, and even that can be viewed as static, since we can conceive of "time passing" as a static pattern overlaid just as any other.

It's an uncomfortable notion for me, not that that precludes it from being true, obviously. But it does seem to make things seem sadder and less... consequential.

It's a common feeling. One interpretation of quantum physics, called QBism, returns to the notion of a subjective perspective. The implications of this are clear: that the subjective perspective in effect has a "private copy" of the world, and our experiences are in effect a traversal of memories not bound to an independent notion of time.

Excerpt:

"But could the problem of the Now lie in relating the present moments of several different people? When you and I are communicating face-to-face I cannot imagine that a live encounter for me could be only a memory for you, or vice versa. When two people are together at an event, if the event is Now for one of them, then it is Now for both. Although this is only an inference for each person, I take it to be as fundamental a feature of two perceiving subjects as the Now is for a single subject."
--- N David Mermin, Nature, 26 March 2014

The author chooses to believe that a so-called live encounter involves the overlap of two conscious frames, and at the same time. There is no reason to do so in the theory, except that he finds it preferable. Why would he prefer to do this?

Because abstract ideas are cold and lonely - whereas the direct experience of such an open, single awareness is vibrant and alive and pleasant. As we cease to grasp onto our apparent individuality as a "person", and by extension our status as an independent entity amongst many separate entities, our attention opens out. Instead of feeling like a Lonely God, we know that we are all people and the entire world, because we are the one and only awareness, which has taken on the shape or state of all of that. The release from this sense of separation - which is what "other people" implies - turns out to not involve being "one" thing at all, but rather no-things because "one thing with no edges" isn't one thing or any thing at all; it is "before" division and multiplicity and change.

So, looping back for a moment -

How to approach this is to consider that there is awareness or being-aware and that is what you are, but that have taken on the shape of being-a-world-from-the-perspective-of-a-person. And the way to make this meaningful, is to pause and investigate your direct experience right now. Finally, we note that the only thing that is fundamentally true is that which never changes; anything that apparently changes is content, the only thing that persists throughout is the context, and that is what you are.

The person you think you are, and other people, can be said to be that, but it is more understandable to say that there is that, and then that patterns itself "as if" there were such things as people.

(Continues)

PART TWO: Intention & Mechanism

The nature of intending and how, exactly, you do that.

This is a really difficult topic, because it goes right to the heart of what we are, and the problems in describing that. Inherently, "intending" involves no mechanism, no division or parts, and hence no cause and effect; there is no action involved and therefore no technique. Which starts to sound uselessly mystical very quickly. I still think we can describe it with metaphors - however practically speaking, as with the recognition of the nature of experiencing, we can only really be it. Describing it in words never leads to the thing itself, although ironically it is the thing itself. One possible approach: If "awareness" is "being", perhaps "intending" could be best described as "becoming".

thoughts cannot alter the thing we're trying to understand any more than they can describe it.

Right. Because thoughts themselves are an effect; they are not a cause. If you deliberately think of something right now - how did you produce that thought? You just "did". Meanwhile, if you think the thought "move my arm" and then you experience your arm moving, the thought did not cause the movement; rather, you intended something and the pattern you intended was both the thought and the movement. The content of experience is always a result; it is the intention that is the only cause. But what is an intention? Well really, it is not one thing, any more than there is such a thing as a "movement" independent of there being a specific movement. Also, a movement is moving, it is the change in arrangement. So there isn't a "we" who causes a "movement" - rather, a change in arrangement occurs, and in language we say that "we" caused a "movement".

Thus, you can't just think to yourself, if you're white and you want to experience being a black person "I want to be a black person" and have it happen.

If you merely create the thought "I want to be a black person", then you've just summoned a set of words and perhaps some extended imagery into prominence. You have not thought change into the world, as the world. You have created a sort of parallel strand. (The Two Glasses approach is designed to avoid this - more later.)

However, there is an extra element to that - that is, because you are awareness, when you deliberately intensify any pattern by thinking it, then you'll likely see it overlaid upon subsequent experience to some extent. If you simply think "an owl" then you get a general overlay of owls incorporated into your existing landscape, with its extended pattern "shining through" wherever there is a plausible gap for it to do so. The implicit intention is "the owl pattern will become more dominant in my experience". What makes the difference between this sort of general patterning - which leads to synchronicity but not to what we'd usually call results - is to include spatial and temporal context, and to specifically include within the intention that this pattern applies to "the world". Sometimes this is explicit, sometimes implicit. It is enough that you simply know what you mean; there is no extra thing that needs to be done.

Note: I tend to use the word "intending" to mean the act of intensifying a particular pattern, and "the intention" to refer to the pattern being intensified. This means that, loosely speaking, an intention can always be described in the from "it is true now that ____", because all intending occurs now, regardless of the sensory moment being experienced. The entire state of the world is present here, now, all time and space, and every intention is a pattern overlaid upon the entire world-pattern, a shifting of the whole state. "Experience is apparently local; intention is actively global." Phrasing things in that form can help us be clear about what is happening: "It is true now that owls will dominate my experience from this moment onwards"; "It is true now that I will succeed at the meeting in November"; "It is true now that name-of-world-fact is new-value-of-world-fact"; and so on.

So to successfully intend something you'd need to access (back to the metaphor) the loom in order to change the pattern. And the loom isn't thought, it's the fundamental truth that "pre-dates" thought.

Yes, you might say that the loom is "before" thought, but you don't need to access it as such, because you are it. It is perhaps better to dispense with the "loom" metaphor, and say that all there is, is the material, and the material has the property of being able to fold itself under its own power. So, no fold in the blanket of material ever causes the appearance of another fold; it is the material itself which reshapes itself as the folds. It may do so in a way that produces a pattern whereby there is a "thought-shaped fold" and then an "event-shaped fold" side by side, but the first did not cause the second - that is an illusion brought about by our viewing one fold and then the other, and by our ignorance of our own nature.

Would it be fair to say that techniques like Two Glasses are intended as stepping stones or bridges between thought and the "fundamental truth" which creates the pattern you are experiencing?

The Two Glasses, specifically, misdirects you into doing something mundane while distracting you from what you have associated with it. Earlier, I mentioned the difference between thinking a thought about the world, in parallel, and thinking the world itself. The Two Glasses basically has you link two patterns to the glasses, and then uses our everyday intuitions about levels to diminish the intensity of contribution of one pattern, in favour of another. The reason the instructions indicate that you should use a single word, is that this forces the person to "feel out" for a word that best captures the sense of that situation - and this leads to them to actually connect with that pattern, having the word arise from that pattern, giving you a "handle" onto it which then becomes associated with the water level in the glass. The pouring of the water from one glass to the other (rather than just emptying one glass and then filling the other separately), leads to a transformation of state rather than simply a disconnected change in levels.

If you simply write a description on the labels without doing then, then you tend to get a more general patterning effect, as with the "owls". You have not really connected your situations to the exercise. Now, often the results can be the same, in cases where you (I dunno) just want to see more red cars and less blue, or something - but if you do that, you are working more at the level of pattern overlays rather than world-pattern adjustment.

Aside: One should really view awareness as containing all possible patterns, all possible facts. All patterns are pre-existing and are always contributing to experience to some extent - just at different relative intensities. In other words, all facts are true all the time, and all that changes is "how true" they are at any moment. Intending is the way we change the relative truth of different fact-patterns. Your current state, and hence world-pattern, is the result of all your intentions up until this moment.

Is there a clearer way to express "intending" and how it's achieved?

Well, I've had a go at it! :-)

Also, just feel I should mention that I enjoy your posts a great deal. It's a profound and fun topic to kick around - but god it's a frustrating one too, and you seem to have endless patience with johnny-come-lateleys to the subject.

Thanks. Yeah, I think it's a lot of fun to explore. Everyone's a johnny-come-lateley at some point, and every time we have a conversation about this stuff, it's always a little bit different, because everyone's coming to it from a slightly different history - new metaphors or ideas emerge - so I like to engage when I've got time. It's not like I've got the best and final description, after all; this is just me experimenting with how to formulate the same old thing in a modern way that makes sense to me.

(I do aim to write all this up as a proper essay post at some point soon, in a structure that builds up piece by piece, but for now let me continue along this thread.)

Meaning

So, most of these questions are actually "meaningless". I don't mean that in a dismissive way - the sense in which they are "meaningless" is in the same sense that it is meaningless to ask how many corners a circle has, or what colour "length" is, or what the radius of infinity might be. Another way of saying this, is that there are numerous "castles in the sky": self-consistent pieces of architecture with unique layouts. Many of these questions are like asking navigational information for one castle, based on the blueprints of another. In order to answer the question, you have to take a step back and look at the context of the question and not just its content.

Which is exactly how we have to proceed when it comes to understanding "dimensional jumping" and the overall understanding that it leads to. We find ourselves dealing with situations where it's not a case of not knowing something, and it's not a case of there being something but we can never know it; it's more like there is no "something" to know or not know. It is logically excluded from the architecture of the "castle" you are actually living in, versus the floor plan you have been looking at.

Solipsism

Let us take "solipsism" as an example. There are many definitions, but let's go with this one: "my experience is the only experience that is happening".

To make sense of this statement, we are going to look closely at what we mean by the terms "my", "experience" and "happening". If we were to discover that the statement is in fact presupposing entities or occurrences which we can not actually find in our experience, we would have to reconsider the meaning of our position - for example, if it turned out that "I" didn't have experiences at all, because I couldn't find an "I". Taking this further, when I examined what I truly meant by "experience", I might find that it is not as I had assumed - perhaps even to the extent that talking about "other people" was nonsensical from a fundamental perspective, because there were no people, at least in the way I had originally conceived of them.

More specifically relevant to your questions, though, is the idea of there being multiple experiences, and those experiences overlapping with one another. Now, we can think about this - but we immediately have a problem when we do that. Which is, that thinking about something inherently requires experience to have already been divided. If we then look at the "thought about experiencing" and assume that it has similar properties to actual experiencing, we will lead ourselves astray - because the properties of a thought are not the properties of experiencing, which "takes on the shape of" thought by dividing itself, but is not itself inherently divided. So, when we are talking about "multiple experiences happening and overlapping", we are looking at the content of thought when we need to be looking at the context or source of thought, to understand the true situation.

Exercises

There are two little exercises I can think of which might help with this. They are intended to generate an experience, an answer you feel-know rather than a verbal description:

- 1. "The End of the World"

Imagine a sphere floating in front of you. Now, contemplate the idea of being the surface of that sphere. When you first imagined the sphere, it was from a "view from nowhere". When you switched perspective, that first view would make no sense within the logic of "being the surface of a where". The surface of the sphere would not be able to think about its own context as a ball within a larger space. However, the "experiencing awareness" in the first instance is identical to that in the second - it has merely taken on the shape of a different perspective. Currently, now, you might consider yourself as having taken on the shape of the experience "being the surface of the sphere". Someone starts talking to you about what it is like to take on the shape of "viewing the sphere from space". You cannot understand it. You keep asking what the curvature of that space is, and how you get there, and so on, trying to understand your surface in terms of that space. However, this cannot be done. There is no curvature, and there is no way to get there via an action as the surface. Only by shifting and becoming the other view, can you comprehend it - and this must be done directly.

- 2. "The Place You Are Looking Out From"

You are currently looking at these words on this screen. Your attention is on this screen. Now, pause for a moment, and also direct your attention to the "place you are looking out from"; the direction that is opposite to the direction the screen is in. What do you find there? What does this mean in terms of the rest of the experience you are having right now? Does this have implications for the content of experience versus the context of experience?

Answers

I realise I'm not answering your questions directly, but hopefully you can see that: a) this is not really possible, because the answer is actually an experience rather than a verbal description; b) the process of looking for the answer is how you get the experience, so there's not much point in me just trying to say it. Make sense? Once the experience is shared, of course, then we are talking from the same understanding, and the same words take on a different meaning (and sound less obscure and koan-like). Can maybe go through the actual questions next time.

POST: Dimension jumping in the hands of the wrong people

The standard answer to this is that, in effect, everybody has a "private copy" of the world. There are no other people who can intend an experience for you - all experiences are explicitly or implicitly the outcome of intensions by yourself, deliberately or not. This doesn't not mean that you have specifically chosen everything that has happened to you; rather, it suggests that your experience consists of the patterns you have intensified, knowingly or unknowingly, plus their logical extensions. If, for the sake of argument, there were other people who could intend bad things as a part of your experience, surely you could solve this easily, by intending that they weren't bad anymore?

Firstly, just to emphasise generally (although you do pick up on this):

None of the things discussed in this subreddit should be just believed. There's no specific worldview that's being pushed, even - except the "meta" worldview that no thoughts-about the world capture the world-as-it-is. Everything else is up for debate. (For example: I, personally, don't really "believe" anything fundamentally, in principle, other than my own direct experience. Descriptions are useful, but they are parallel to the main experience. And so on.)

The idea, then, is that you put aside any assumptions you might have, pay attention to your direct experience as it is, contemplate it a bit more deeply than normal, draw your own conclusions. It's an exploration of "the nature of experiencing", albeit hopefully with some happy side-effects. But the getting of what you want isn't really the main purpose; it's more about the getting of why there was the experience of getting. But it always comes down to this, to reiterate:

- Never "trust" anyone in these matters, but don't "distrust" either; be a skeptic in the true sense. Take inspiration from others' ideas, then check them out for yourself. And if something doesn't work or make sense after you've given it a go, you put it aside. Or equally just don't bother in the first place, if it doesn't seem interesting or worthwhile; that's fine too. (Just don't draw any conclusion one way or the other based on not trying.)

I'm repeating that because the only way someone can cross the line between just fantasising about some concepts and actually experiencing something, is to **actually do some experimenting**. As I said earlier, concepts are just "parallel constructions" that give us a framework to think in - and that applies to both your everyday notion of the world and these alternative frameworks. They are not "true", the only thing that is "true" is direct experience. If you confirm things for yourself, though, you don't need to worry about that.

Let me say this, though: *I am completely sincere about this topic and I wouldn't waste my time in discussions if I didn't feel others might find it interesting and beneficial too*. Meanwhile, unfortunately, the language can start to get a bit abstract sometimes, especially at those times when the topic is based on an idea or observation that isn't being explicitly stated. The phrases get all "mystical" without any apparent grounding. And sometimes we're just pushing a philosophical line of inquiry to see where it goes, asking provocative questions that are a bit awkward. If stuff doesn't make sense, though, question it (like this). And if someone can't answer properly, then maybe they are talking bollocks! :-)

So, anyway -

But when you say things, like consciousness is eternal or I am the only one in existence, it gets me really trippy and I don't see how you or anyone could possibly 100% confirm that it is true.

To understand this, we need two things, I'd suggest:

1. The direct observation of what your ongoing experience is actually like, rather than what you think about it being like. This direct experience is what a lot of this is built on. Words simply point to experiences; if you've not had the experience of "a soft texture" then no description of it or idea based on it is going to be meaningful to you, for example.
2. To be clear about what we mean by something "existing". (Ponder this?)

It turns out that the first one leads us to think of the second one differently, since it adds a new context that is "before" our usual default understanding of the world. This in turn changes the type of metaphors we use to construct out descriptions. Specifically, we are confronted with the problem of pointing to something which is "before" our usual models. And that's where we start saying thing like "eternal", "undivided", and all the other things that it is not. Without the experience, though, and the philosophical line of questioning that follows from it, that seems like mystical nonsense that makes "zero "sense" - just as you say! :-)

One metaphor that helps us avoid being incorrect, even though it can't capture the actual situation, is to start talking about the world as a "shared resource of patterns" rather than a "shared place or environment". The more you experiment with things, the more you find yourself needing something akin to an "abstract patterning" and "private copy" framework in order to think about it. But that arises from the observations, created as a useful tool; it is still not something to ever believe in as being fundamentally true.

We all have layers inside us, and I always wonder about the hidden truths about other people, but I digress.

It's actually an interesting thing, forums like this, because I think most of the people we are having conversations with probably don't discuss this sort of thing with the people they know in real life. Even just the philosophical aspects. Not necessarily because it's secret; actually, few people are interested in pondering such things. This subreddit has about 7k subscribers - from the entire world. What are the chances of knowing another one of those people? And then, what are the chances you'd end up broaching this subject? Who knows what could be going on in the mind of passing strangers and random people in coffee shops! :-)

From my own experience, I know a couple of people, but not many are really interested in digging around. Most folk - and this is totally fine - are looking for some sort of technique to get a result, or are looking for enlightenment but think it is some sort of feel-good state, rather than a realisation of something.

You don't necessarily believe all these metaphors and other "truths" you speak of if you don't have any direct experience with it.

I find the whole idea of "belief" a bit of a distraction. It's in the same category as "existence". We assume we know what it means, until we actually look and check what it is that we mean!

The way I'd maybe separate it out is:

1. There is the **fundamental truth** of the "nature of experiencing". This is the context of experience. You can directly observe it because you always are it. This is "what experience is made from". It is always true and always the same. You can't really describe this in words, because it is "that which words and thought are made from"; you can only be it and know it directly. For convenience, sometimes it is described as the "open space of awareness".
2. There is the **relative truth** of what you are experiencing. This is the content of experience, arising in "open awareness". Typically, you might consider that there is:
 - A "main strand" of experience, where you are experiencing being-a-person-in-a-world. This is a sort of 3D-immersive multi-sensory strand of thought which fills up your awareness.
 - There is the occasional parallel strand of experience where you are thinking about the main experience. This tends to be sort of localised in a sub-region.

In both cases, these are coherent - they are self-consistent like a continuous pattern made from one piece of cloth - but because they have no inherent permanence, they change, they are not fundamentally true.

It makes no sense to talk of "believing" in something as such, because if you are thinking about something then it is a parallel strand. Meanwhile, if you are experiencing something then you know it. So there is a difference between knowing what you think about the world, and knowing the state of the world directly. You might say that every strand of content has its own "relative truth", and then there is the context which is "fundamentally true". Where it gets interesting, though, is that it suggests a certain potential: since the main strand is no different in nature to the parallel strand, then just as it is possible to use intention to pattern your thinking, it might be possible to pattern your main strand of experience in the same way. Your main strand, it could be suggested, is just a sort of unbounded thought unfolding in awareness, albeit a quite stable and intense one, and you can "think it" differently.

However, only personal experimentation could show whether that's a valid way of approaching it.

When I read these ideas and metaphors, I don't immediately take them as fact but I don't immediately disprove them either. I mull over them and sort of let them "float" around in my head. I never set anything in stone as a "fundamental truth" because as you said they are still only "parallel thoughts" about this world.

Right. That's how I treat these things. If you just view everything as "interesting ideas" that might come in handy, then you don't need to judge them in any fundamental way at all. In fact, it's sort of meaningless to do so. Their value is as a source of creativity and curiosity. After all, even concepts which appear to map directly to aspects of ongoing experience are not really "right", they are just "self-consistent" (although there often seems to be a tendency to treat them as being more deeply "correct").

I guess I jumped the wagon on this one and immediately thought about all the materialistic stuff I could get, when this is far more spiritual and about self discovery than anything else. I don't really know where to start though, do you meditate? If so, what are your techniques and how often?

I think it's totally fine to get excited about the possibilities! "Materialistic stuff" consists of experiences just like anything else, including spiritual stuff. Personally, I don't really meditate. I do a daily releasing exercise, that's about it. Lie down, let everything unravel as it wants without interfering. In terms of better perceiving our experiences, I think it's good to go for it directly: simply by attending to the experience you are having, and looking for that open space, you will shape yourself into it. So, spending time just closing your eyes, "feeling out" in to the space around you, and exploring the content of your experience - where "you" are, what sensations, perceptions and thoughts are floating in your experience, that sort of thing - is all good. The lesson we derive from that isn't that we find some ultimate state; rather we discover we are all states, and that we shift into any state by "taking on the shape of" that state. The fundamental truth is, funnily enough, always true!

You didn't answer the part of the question I was looking forward to lol, but I didn't expect you to either.

Well, you knew I was just going to tell you to explore things for yourself, right? ;-)

There's no confirmation of anything other than self-confirmation. You totally seem to get it: thinking about stuff is a different thing to actually exploring it. At the very least, I can promise you that it will be interesting and will add an extra layer to daily life that will make it more enjoyable; beyond that, you can extrapolate things and see how far you can take them, if you want to. The posts here and at subs like /r/glitch_in_the_matrix should act as a source of inspiration, perhaps.

Q1: Ahh, I'm surprised you don't meditate. I've been wanting to get into meditation for years but just never took the time to really delve into it and I couldn't find much time either. But I'm about to start practising a technique you mentioned in a post (I can't remember which post) where you told us to relax and turn off every sensation and just remain in that position for about 10 minutes before eventually trying to "will" your arm to move without actually moving your muscles. If I pull this off, I feel I'll have broken down a major barrier that's holding me back.
If you don't mind me asking, I'm curious to know if you'd feel comfortable sharing your "end game" that you'll hope to achieve, even if only vaguely.Sort of like in this thread which you may have already seen. If you don't want to then that's totally alright. But optic fibre is right, you're a unique individual and everyone on this sub seems to be entranced by your words and seemingly unbounded knowledge. There's a certain amount of mystery that draws me to you. I feel you'd be a real challenge to try and figure out in real life. I wonder what it would be like to know you in real life and I wish I did. Luckily we have this forum so we can all pool our ideas and experiences together to create a vast pool of knowledge. I find all the answers in that thread I linked, very interesting. It seems deeply personal to know one's deepest desires but it's inspiring and gives hope where it was initially perceived to never exist.

On meditation, well it sort of depends what you think it is and what you are trying to achieve - and there are many sorts. Lying down on the floor every day, sometimes sitting, and doing nothing - by which I mean ceasing to interfere with movement of body, thought and attention - is basically Zen meditation
[<https://en.wikipedia.org/wiki/Shikantaza>].

Generally, if someone is meditating in the hope of enlightenment, I'd say don't bother. (But I'd also say: don't pay too much attention to what I say!) Understanding the nature of experience is something you pretty much infer and then confirm. But it's worth doing something (daily releasing exercise) to get experience of allowing things to move spontaneously "by themselves", since that helps dissolves people's tendency to continually re-assert their current position, in opposition to the flow towards outcomes they have intended.

Ha, the phrase "end game" makes it all sounds like a nefarious plan for world domination! :-) Well, there isn't one. It's interesting in and of itself. Having these discussions can make it sound like it's the most important thing, but really it's not; your ongoing experience is what's most important. Having insight into our incorrect assumptions of how things are is great, but beyond that there's: living. I think we have to be careful we don't spend all our time contemplating and meditating, and forget to drink beer and go to art galleries (or whatever). :-)

There's a good book called Ideokinesis by Andre Bernard, a dance teacher who taught imagery and spontaneous motion approaches (it's related to this topic). At one point in a class, as Bernard is discussing his ideas, a guy asks "but what's this for?". And a girl responds: "It's for life!". And that is the end game and it's the only game, no matter forms it takes, I think. I have to agree, I think it's great that these communities can pop up, and people from all over the world can find overlap and exchange their thoughts and experiences. Even a decade ago, this wouldn't have been possible in quite the same way.

Q1: Ahh right.
Having these discussions can make it sound like it's the most important thing, but really it's not; your ongoing experience is what's most important. Having insight into our incorrect assumptions of how things are is great, but beyond that there's: living.
Yes I agree with you on this one. I must confess I think I might have let all this change my perspective a little too much. As of late, I feel like I've been thinking less and less about my future. I only ever vaguely think about my future but now it's like I'm neglecting it. Everything I experience in the current moment is almost like it's temporary or just for fun. Just another thing before I say good bye to everything. I'm not suicidal and I don't ever plan on committing suicide but I can't deny that I haven't thought about doing it just to see if there really is anything on the "other side" (haven't we all). For the last few years I felt like my future was this black cloud, it made me feel like I'd never experience it. Like I'd die or end up in some vegetable state. But that feeling eventually went away and now I find myself not thinking about my future at all. I can't help but let myself be absorbed by all this stuff, it's so intriguing. I know I mustn't let myself lose sight of the big picture, which is to essentially experience.
I've been over at /r/Oneirosophy for a bit and the stuff I read there just pulls me in, closer and closer. I think I'm letting myself get a little too carried away. I've planted these ideas in my head. I fear I want something I cannot have. I have my whole life ahead of me and I'm letting myself get carried away when I should really be focusing on enjoying life, instead of pondering how 'empty' and 'bleak' everything feels and asking myself can I really have something more than "this".
Regardless I know my perspective on life has changed radically over the past couple of years and my perspective will continue to change as I experience life. I wanted to ask you, what you think about the stuff they do over in /r/Oneirosophy. Why don't you think "enlightenment" is the way to go? When you die, do you simply wish to have the experiences you had in life and that's it? If I really wanted to go about, trying to find the cracks in reality and eventually pull it down, would I do that via meditation?
Thank you once again for your thoughtful answer, I'll be sure to check out that book when I have time :)

Everything you say is pretty normal, right? I think anybody who ponders the world and how things are, explores those thoughts. And it's even fine to get carried away with things - but keeping mind that thinking about stuff is also just another experience, a parallel construction, and the larger lesson is that there is no fundamental "how things are". It's if you find yourself dedicating too much time looking for "the final secret knowledge", when really the so-called mystery is just rooted in the fact of moving your arms and mundane everyday stuff like that, that you need to watch out. Experimenting, yes, because that is exploring experience. Just thinking about things, making up parallel fantasy worlds only, that's what we have to be wary of (unless we do it knowingly for fun, that's different; that's art).

As one of the originating mods of /r/oneirosophy, obviously I'm all for it! But it's important to keep it in perspective: those are philosophical discussions about the possibilities inherent in the subjective idealist view. Such things can be empowering, but only if they are used as creative inspiration for deliberate exploration. There is fun in just thinking things out too, but there's a reason that the sidebar here explicitly encourages trying out a couple of exercises, and underlines that explanation and descriptions are metaphors. Whether "enlightenment" is the way to go, kinda depends on what you think "enlightenment" is? It's becomes such a vague term I think. What do you think of when you read that word?

Definitely, I'd agree that having an understanding of "the nature of experiencing" is a good thing, but that's relative straightforward, albeit not easy to put into words: you are "that" whose only inherent property is being-aware and which "takes on the shape of" experiences. The real issue we face is, that we don't see the whole of our state unpacked into the spatially-extended senses all at once; this makes it harder to develop faith that intending = reshaping ourselves = shifting state = updating facts both now

and then. In other words, that intending to move your arm (effectively: "it is true now that I will experience my arm moving then", where "then" is about half a second) is identical to intending any other experience ("it is true now that I will experience receiving my top grade then"). Again, only actual experimentation can reveal whether that is actually true or not. Thinking about it just produces yet more descriptive schemes (because that is what the implicit intention of thinking is).

...

those with good intentions and good deeds live in squalor...

All of this might be somewhat self-fulfilling, I suppose. However, it might be interesting to explore this bit: Which good intentions and good deeds, specifically? What counts as those? And how are those apparent people going about it? Also, what power would or could such people have over other people's circumstances?

If everything is in your experience, what are you doing about it? Wanting is fine, but that amounts to thinking-about the world - and often in ways that imply the current state rather than a target state. Note that, also, it might be the case that mere action doesn't help: the intention to experience acting is one thing, the intention to experience outcomes is another. And so on.

...Maybe if we take one strand of that and run with it? Specifically, the idea that "spirituality" is a good outcome for the world, in and of itself. (I dislike that term, it seems pretty much meaningless, but I can't think of another one that doesn't require lots of explanation.)

If one spends time studying the nature of things, what happens? One reaches a greater understanding of what ongoing experience actually consists of; hopefully, a clear and direct awareness of what you actually are as the context of experience as well as the content of experience is the result. But does this necessarily alter the content? Make the world better? Well, no, not inherently. Realising that, say, everything that arises in your perspective is made from "consciousness" doesn't change anything at all; it merely shifts your understanding of your nature and the nature of the world. There may be a bit of a shift due to relaxation and acceptance, but perhaps nothing substantial beyond that. Furthermore, you likely realise that content and consciousness itself contain no judgement about things being good or bad. It not only doesn't care, it doesn't even know what caring is. It doesn't actually know anything; it just is everything. Everything just "is"; one pattern is equivalent to another. Patterns are added to patterns, the world shifts, it has no intelligence in and of itself. You are the only intelligence and you are the only thing that "acts".

So at best, "spirituality" offers a new perspective on self and world. It doesn't necessarily lead to good or bad things; that's outside of its remit.

"Do you think there's too much suffering in the world?"
"I think there's just the right amount."

So a couple of thought-provokers:

- Having come to an understanding, after that is where the decision to do something or not, and what that something will be, becomes relevant. The understanding itself accomplishes nothing.
- If you want to be wealthy, maybe you just do have to become a banker or a lawyer? Because that's how you made this world! ;-)
- Perhaps trying to reformat this world is a mistake. You've already created this world as it is, unwittingly. Are you seriously going to completely disrupt the patterns of all these pre-existing people without their permission? That seems selfish.
- Equally, you could perhaps think about switching out of this experience and into another - but a moment's thought indicates that this amounts to the same thing: reformatting your experience is reformatting these people. Even more selfish! :-)
- Why does it matter so much to you, the way the world is, and your judgement of it? And are you not basically judging yourself anyway by doing so?

For convenience, I guess we should ditch the "soul" and "spirit" terminology, because I think it has clashing connotations, particularly in terms of being located in an independent space somehow, or within something, or whatever. "Nonlocal self" is a nice term, but I tend to go with something like "open awareness" simply because it has the feeling of being "before" arrangement in space; experiences arise within it, as spatially-extended senses, but it does not itself have a location nor extension nor boundaries. But anyway, I guess we're talking from the same idea really: that which experiences, and that which experiences are made from.

I suppose, first, we need to firmly recognise that if the world was the result of our cumulative intentions, then it was not done deliberately. Simply focusing on a pattern would intensify its contribution, and that in turn would intensify its extended pattern of logical implications. For example, if I focus on the existence of a tree, then that logically implies soil and water and sunlight and birds and an ecology: an entire world immediately springs from that thought, is implied by it. We wouldn't say that we meant to create that world; but nevertheless our act of increasing the contribution of one pattern did result in that world's (relative, apparent) creation.

So, now there's a world. For certain, you can't "escape" from that world - because you are not actually in that world. What can you do instead?

"if the world was the result of our cumulative intentions, then it was not done deliberately" but it must be, mustn't it?

Hmm, I'll be clearer on that. I don't mind it's not originating from/as you; I was talking about whether you are doing it deliberately - having a conscious purpose in mind. So, if you are focusing on the image of a tree, but do not understand that doing so corresponds to intensifying a tree and triggering all the associations, then you have not deliberately created a world. When people talk about there being a "purpose" to the world they find themselves in, and the troubles they are going through, they are implying that there is a reason - a reason that was consciously chosen, to teach a lesson (or whatever). But that's not the case. The world you have ended up in, while a result of a series of intentions, was basically an accident, because you didn't know that you were intending or what the nature of the world is. The world is not intelligent - you are the only intelligence. So if you act out of ignorance, there is no correcting system that is managing things afterwards. The world itself amounts to a "dumb patterning system" that simply has its eternal patterns intensified or dissolved with no say in the matter.

in the same way that even if i died, why wouldn't i then 'respawn' in the same/similar world and carry on after the point at which i'd died beforehand.

No reason why not, necessarily. Although, if you have a firmly patterned idea of death being the end of life, then the logical implication of a death scenario for you might be that all memory of the current person is effectively lost to you, and the next thing that appears in your awareness is the experience of being born as another person. If your intention to live as your current person is strong, then perhaps instead of that you'd experience a discontinuity, such that the car crash suddenly didn't happen, or you survived after all, or whatever (perhaps with some collateral shift side-effects).

the only conclusion i've arrived at is to create the world with purpose

Right. And as you say, this is tied in with knowledge. The realisation that is required, to be purposeful rather than accidental (see above), is to understand the relationship between world, self and intention-implication. But having got that?

You are essentially talking about thinking new facts into the world, updating the relative balance of constituent patterns, or allowing this "world-pattern" to fade relative to another world-pattern which you seed with an intention.

...so i'd like to have the experience of creating portals and then the experience of overtly changing the world...

Which is where intending base formatting comes in, rather than just intending outcomes. The latter is simply overlaying a target pattern on pre-existing structures (giving "plausible results albeit by unlikely apparent routes"); the former would be a more "meta" targeting of the landscape of potential routes itself.

as in traveling: the motion itself is the structural 'route'; hence the 'portal' experience

I'd say you want to create a similar experience to an OBE, stripped of the "astral body leaving my physical body" concept, instead knowing-that everything is a movement of experience as a whole, and imagining-that going through a portal is a state transition. If you really spent time with it, I guess you could just choose a doorway and have that represent the state change (which is something that people do for minor facts anyway).

yes that's exactly what I think

Actually, the "Infinite Grid" animation was initially conceived of as a way to create a structured imagination object that could be used for changes via "translation" - it's not dissimilar to the "OBE you don't come back from" concept, if you think about it.

it's that switch from looking at something and then looking at something else
what do you mean by "translation"?

Yes, I meant "translation" in the mathematical sense rather than the language sense: shifting your location on the metaphorical grid of possibilities, while keeping your identity intact.

so how would you go about changing in to a new location? if I decided on a place where I went through and exited in a new location - how? changing base formatting so all I have to do is intend it
but that's easier said than done!

Well, that's the trick, isn't it? There is no how - it's just intention. You need to imagine-that it is happening until the relative intensity of that imagining is stronger than the things you have imagined (intended and implied) thus far.

...

Q3: I don't really believe in a "global conspiracy" (since such hypothetical people would be entirely selfish and could not work with others to rule all corners of the world together in a significant fashion, at least for very long), but about two years ago I'm pretty sure that Great Britain made it very difficult, if not impossible, to search for occult subjects online. It does make me a little suspicious about that.

Well, "esoteric material" was one of the "sensitive subjects" on the list for David Cameron's ISP-level filtering drive:

"As well as pornography, users may automatically be opted in to blocks on "violent material", "extremist related content", "anorexia and eating disorder websites" and "suicide related websites", "alcohol" and "smoking". But the list doesn't stop there. It even extends to blocking "web forums" and "esoteric material", whatever that is. "Web blocking circumvention tools" is also included, of course."
-- Cameron's internet filter goes far beyond porn - and that was always the plan, New Statesman, 23 December 2013

Now, supposedly those filters are opt-in, and there's been a lot of messing around in this are over the last couple of years which makes it hard to tell what exactly has happened, but at the very least the ability to select and block was probably but in place. Meanwhile, clauses in the current Draft Investigatory Powers Bill specifically deal with preventing companies from revealing that they have been ordered to interfere with equipment and data. Since it's accepted that this bill is an attempt to legalise behaviour that was already taking place - to normalise it so that it can be used more directly and openly - it wouldn't necessarily surprise me if blocking was already happening, silently.

So basically: it's not a conspiracy, it's a documented fact that the British Government has sought to create, and must already have put in place, filtering capability related to "esoteric material", which would include "the occult" and probably many other things which you and I wouldn't even consider that far from the mainstream. Whether it is active or not, and in what sense, is debatable.

Q3: I see. Thank you for this information. I figured that this was already happening on some level or another, and probably in many other places. Google is probably at least monitoring what information is being sought right now, and making trends and correlations with the data. Knowing that they also own sites such as Youtube, it would be really interesting to even look at a summary of their collected data. It is kind of scary, to be honest, and it is a vulnerability that most are not aware of, or don't care about. I'm slightly of the latter, but really only because I'm a nobody (at least right now).

It's a good idea to use Startpage anyway [<https://www.startpage.com/>], I'd suggest, just as a point of principle.

Of course, ISP-level monitoring of "internet connection records" and warrentless access to it by dozens of agencies, as mandated by the draft bill, is the important issue going forward. (Basically: that's everything, including location info and other data phones and apps send as part of their operation, any other bits and pieces, not just the things you specifically request as a user). See the summary on page 33. Note that terms like acquisition, interference, communication, transmission are not necessarily meant in the casual-use meaning of those words. Developments to keep an eye on at least, as a good citizen, I'd say. The ID cards project (really: ID database) was prevented a few years ago; same deal here. No point getting too paranoid, eh! :-)

Q3: Good idea. I actually make it a point for me to never own a smartphone; not only are they unnecessary, I just see it as a mistake/crisis waiting to happen. But oddly, so many people have them, and are oblivious to how vulnerable they are with them. I only know in real life two other people who don't have smartphones. It is just so weird to me, especially when I see everyone just having their eyes glued to them while I'm walking down the hall.

I've lost track of how many times I've had to dodge people walking down the sidewalk staring at their phones, not looking where they're going. Then there's this guy [<https://www.nydailynews.com/2015/12/26/man-dies-after-walking-off-a-cliff-in-san-diego-while-distracted-by-electronic-device/>]. The zombie apocalypse is already upon us.

Q4: That's incredible. I wonder what the official spin would be if Dodgy Dave was directly questioned about why society should be threatened by 'esoteric material'. It's all supposedly 'magical thinking' nonsense anyway so how could they justify this.

I think it's actually just part of a broader notion of anything that contradicts Conservative (the party variant rather than general conservatism) ideology. It's not specifically about being anti magical thinking - in fact, they are massively prone to engaging in it themselves, and not the "good" kind. It's not as if they are great followers of scientific evidence, after all; they regularly discard research and evidence and plough on with ideologically-driven legislation. They generally quite keen to silence all contrary narratives, even when from their own advisors, and scientific bodies generally.

Q4: I guess I should be glad that I now live in Canada but I wouldn't be surprised if the Canadian government already have (or are working on) something similar. It's the mentality of separation that a certain kind of power often brings. The further removed from the 'common man' those in power become, the less they can truly identify with their wants and needs. Instead they'd prefer a docile, easily controllable populace who think and therefore act within acceptable predictable parameters. I remember a particular author - the name escapes me right now - who talks about the importance of being able to learn from within yourself (tapping into the infinite reservoir of information) as there may come a time when you might not have access to the 'outside' information required. I've always thought that the honing of this skill would prove exceedingly useful.

That's an interesting point about "learn from within yourself". I definitely think it's very important that a person knows how to reflect upon and explore their experiences and think through their meaning - rather than accept a conclusion given to them. Not that many people seem to want to do it, though.

It's definitely the viewpoint of this subreddit - try things out, ponder for yourself, don't take anyone else's word for anything (not because they might be misleading you, but because your own experience might differ or your own interpretation might lead to different conclusions). While it might be tempting to have others think on your behalf, in fact nobody can think on your behalf of your perspective. (So we shouldn't be too surprised when, say, power groups don't act in our interests: even if they aren't being selfish, at best they can operate on an simplified idea of who you are as a collective.)

POST: Is DJ basically about awareness 'De-patterning' and then its 'New-patterning'?

For clarity, we should probably emphasise that it isn't "one's awareness" - rather, it is just "awareness". This "awareness" is what you truly are, but it is not a personal awareness. It has no inherent properties other than being-aware. This is the only unchanging truth. Meanwhile, so-called personal awareness in its various forms - by which we mean states and experiences of apparently being you-as-observer or you-as-perspective or you-as-a-world-from-the-perspective-of-a-person or whatever - are all actually

just patterns/formatting of "awareness". This might seem pedantic, but it changes the level at which we consider things like "dimensional jumping". Which is to say, we must view it from the the level of context (the nature of experiencing as patterned awareness), which is "before" any content including formatting like "spatial extent" and "apparent unfolding". This means that absolutely all content is relatively true only, has no solid backing, and is subject to alteration.

(Of course, even the idea of "patterning" is a metaphor/formatting, but it is so abstract that it's probably the lowest level that corresponds to a sensible and self-consistent experience that can be talked about. Beyond that, you are probably not really dealing with experiencing a "world" anymore.)

I enjoy the way Nefandi explained it in one of their posts. Context being the stage, content being the play appearing to occur on the stage. So by formatting the stage, you set up the types of plays that can occur thereupon.

Yeah, that's a nice metaphor. Similarly: the landscape defines the available paths across which water may flow, and so on. (Although in both cases, there's an implication that events "happen". Perhaps better to conceive of a static form, across which attention "happens".)

At one point there was the idea of a "pattern stack" where the lower levels would be base patterns or formatting (like "spatial extent" and "unfolding change"), then perception patterns (sensory aspects like colour, sound, texture), the forms, then facts of the world, then movements, then outcomes - and so on. But then I saw that as too formal, and perhaps in danger of becoming a "how it really is" description. Far better to just fully embrace that you can pick any metaphor and render it "active" by intention/implication. Using a metaphor to formulate an intention also implies the metaphor, and you pattern experience accordingly simply by intending the outcome in those terms. Can you think of what you want to experience and see a logical connection, any connection, to your current circumstances? That's it, then. No real need to decorate it further. The world of patterns has no hierarchy or depth (those things being themselves just metaphors).

POST: found a new manifestation technique in a old reddit post in /r/lawofattraction

Hmm. It's seems like an awful lot of ritual for what it's doing, and a bit muddled too: "sending messages to the universe" mixed with "assignment of meaning to an object" mixed with "direct assertion of fact". I think you'd be as well just closing your eyes and asserting the fact of your desired outcome (in the general non-verbal format "it is true now that ____ then").

This is actually my problem with LOA generally: it lacks a structure because there's no underlying model, which makes it easy to end up doing things which have an apparent "structuriness" but are really more like superstition. The active ingredient ends up being incidental or even largely lost. Really, intention is the only power, and everything else is about structuring that intention. Without a clear structure or framework, you're potentially mangling your outcome, and you'd be better just asserting directly. In other words, despite the presence of a glass and some water, it's really more "owls" than "two glasses", and a compromised bird at that. The reason the Two Glasses exercise is structured as it is, is to acquire actual "handles" onto pre-existing patterns and then alter their relative intensity of contribution in a co-ordinated manner. Each step in the process is worded to allow that to happen, whilst distracting you from interfering or counter-intending. (Meanwhile, if you're curious, the original comment describing the Two Glasses exercise can be read here [POST: [EXPERIMENT] Glitch Generation Test, I Need Your Creative Ideas!].)

Which isn't to say the exercise mightn't be useful; but in terms of an exploration of the nature of experience, or even a straightforward seeking of results, I think it maybe obscures more than it provides, perhaps.

...Pretty much. I'd say it's more effective because the actions have a specific meaning, created implicitly via the way the exercise is structured, rather than just being a sequence of arbitrary movements. Remember: there's nothing inherently special about water, labels, drinking and pouring, for example. The key ingredient is the explicit or implicit assigning of meaning or intention to component objects and actions (these can be "physical" or "mental"). Unless your instructions lead you to do that, probably covertly, or you understand that specifically, then you're just moving some liquid around and writing some stuff.

Intention is the "secret" behind everything. Unfortunately, it can't be described or taught, since it's not really a method or a mechanism; it's just something you are and do. Ironically, it's how we always actually do everything that we assume we are doing by other means!

POST: Can you get stuck going in between or delayed?

Some metaphysics guys explained that I'm still coming through to the next dimension but idk

I like that. "Hey, who was that I saw you talking to yesterday?" "Oh, them? They were just, like, some metaphysics guys I bumped into between dimensions."

POST: On the 'acceptance' of facts via implying them

[POST]

Hello to all my fellow jumpers

I wanted to share with you all a simple but very effective technique that has given me some interesting results lately. As some of you may or may not have realized, accepting something as fact is a great way to make DJ work, but in many cases you might have found that wrestling with your beliefs to insert a new one can be as difficult as tearing down a concrete wall with your head.

Let me draw your attention to the following popular saying: "Dress for the job you want, not for the job that you have."

I've been a DJ-ing enthusiast for longer than I can remember, and let me tell you I must have wasted years walking in circles before it started to dawn on me how the subconscious works. In many occasions, by trying too hard and putting too much effort into trying to make my subconscious accept X as a fact, I ended up sending exactly the opposite message: that X was NOT a fact. If you are bullheaded like me and probably haven't been able to get DJ to work despite insisting, it's probably because you are falling in a similar pitfall.

So, what am I proposing here? Instead of working to insert a new belief, I invite you to experiment with the concept of working with them. What sort of clothing would imply that you have the job of your dreams? What sort of walking posture would imply to you that you have high self-stem? What sort of habit would imply that you are happy and fulfilled?

I invite you all to experiment a bit with this. Ask yourself the question: if you had what you want, what sort of little thing would change in your habits that you could do now to imply that you already have it?

If you have a similar method, please do share it with me in the comments. :)

[END OF POST]

A1: Acting as if is definitely something that's worked for me on a number of occasions. I've had experiences where I had no discernible way of logically getting something for a long period of time, and then by choosing to simply act as if I already had it, within a few days it presents itself to me, or something even greater. Sometimes it's met by a seeming negative occurrence, but the true outcome is that the negative seeming occurrence actually led to the greater outcome.

A2: Agreed. I'm going through a current life circumstance change. Under my old "little me" mind I'd be depressed and anxietized.. but this time feels different, there's a sense of unseen guided hand moving mountains. To my old single mind, this would be my life being destroyed.. but yet I know this to be the creative process opening "the ways" for water to flow and even greater experiences to be had.

Q1: Bonus: of particular interest is a dream that I had a few years ago in which I was looking for a computer component to install on my computer. I must have spent about 20 minutes on that dream searching for a store which sold the device without any success.

The more I searched and traveled across the dream city, the more it became like a maze and expanded & created more and more streets and buildings ad-infinity. Until I stopped searching and materialized one in a question of seconds. My ceaseless searching kept implying that I had not found, and that in turn kept me running around like a dog chasing after it's own tail.

So true. It's the intention and its implications that matter, and intending outcomes is what's important. What we are really intending is always, at heart, an experience. If we intend looking for something, then that's what we get: the experience of lots of searching. If we intend something is found - or as you suggest, do it indirectly by intending something else that implies that it is found - we save ourselves a lot of traveling. This is also why in general life, we should intend where we are going, rather than intending the movements that theoretically should lead us there. The former directs experience towards the outcome, the latter simply guarantees some movements.

I'm going to riff on the topic a bit, and see if we can't get a bit clearer on the background context. Let's maybe wind back a little and be specific about what exactly we're doing, using our little patterning model:

Model Overview

- What you are is "awareness".
- Awareness is always in a particular state.
- That state contains - or rather implies - the full subjective definition of the world (the "world-pattern"), including all past and future moments, all of which are full determined between each intentional shift.
- A state actually consists of all possible patterns of facts simultaneously; patterns are eternal. What defines a particular state is the relative intensities of contribution of the patterns.
- The world-pattern also includes the base formatting of experience - for example, "spatial extent" and "time is passing" and so on. These structure the basic logic of the apparent world experience; they are by nature more intense, or deeper patterns, metaphorically speaking.
- When we "intend" a change, what we are doing is increasing the relative contribution ("intending") of a pattern of facts ("the intention") within the world-pattern.
- This re-patterning of experience is "dumb". There is no intelligence behind it; you are the only intelligence and the only cause.

This gives us a few things to consider:

Model Implications

- You literally get the pattern you intensify, overlaid upon experience, although this includes the felt-meaning of the pattern rather than just any sensory aspect you conjure up via visualisation or whatever.
- Direct intensification of an image, like an owl, will overlay the picture of an owl - and to a lesser extent its extended associated pattern - over all experience, without regard to spatial or temporal context. This is like drawing on a TV screen and the image shining through where there is a gap. This gives rise to what we would call synchronicity. The experience that arise tend to be "about" the target.
- Adding more contextual detail to the owl image will restrict the gaps in which it will appear; the more specific the image the more it tends towards corresponding to a particular event. This tends towards what we might call coincidental manifestation.
- Adding felt-meaning to the image - basically, conjuring the image while knowing that it means-that such and such will happen, makes the intention more specific still. This tallies more tightly with what we'd call generating actual outcomes.
- This is where the actual power is. It is problematic for people to think about, though, since this felt-meaning isn't really experienced as such, or at least not in an expanded way. It's a sort of background dissolved "knowing".
- Then, we have a variant where we imagine an intermediary object while considering that the object means-that a certain outcome will be generated. This is what the "sending messages to the universe" type rituals do.
- Finally, we can do a variant where we imagine or directly intend with the world-pattern itself (using mental, physical or even no objects). We summon up or imply an aspect of the world-pattern, and then imagine operating upon it.

All of these, despite the appearance of being different due to the differing experiences which accompany them, are actually the same thing: intending a change of state.

Model Considerations

So whatever approach we do, the question to ask ourselves is:

- What are we actually intending?

And sometimes it can be:

- Are we even intending at all? Simply performing mental or physical actions may achieve nothing at all, or at best the basic patterning that corresponds to the owl example (typically appearing as synchronicity). What is important is the intention which accompanies any action or non-action - and that intention actually is the outcome.

So, there is no inherent problem with updating the past or the future or the present, because it is all within the current state, now. [1] The difference between the owls and the Two Glasses, though, is that both of them simply overlay or shift the surface patterns without contradicting "plausibility" - plausibility being the base formatting of your experience (that of apparently being a person in a location in a world which is unfolding steadily). Now, one rule that emerges from this picture is that any particular state, between shifts, must be coherent: the world must always "make sense" because it is a single continuous pattern. This means that a shift of state must occur all at once; you can't be "standing on" one part of the pattern while trying to tug at another part, if those two aspects are logically dependent as a requirement for world coherence. In particular, since things that you "definitely know" - in the sense of having already experienced them or had them implied - are the most intense patterns of all, overcoming them requires a surrender of control of any aspect of experience which implies those things, as well as firm full intention of the new state. This, I suggest - perhaps coupled with incorrect structuring of intention - is why certain areas can be problematic.

Basically, then: full surrender of the current state, plus persistent but effortless intention (while avoiding implying any base formatting which would oppose the change), would be the avenue to explore.

[1] In fact, the reason the owls experiment is called The Owls of Eternity is because it often has the effect of producing experiences which apparently must have begun in the past, and even noticing things that "must have always been there" but you can't help but ponder.

...Good stuff.

People here are doing nothing but what other people are doing with LoA just with a cooler label

I'd perhaps disagree with that (although it depends on the "people" in question, of course). I'd probably say that the basic nature of experience is, obviously, exactly the same regardless of whatever subject we are talking about - be that LOA, magick, "dimensional jumping", all that. So in that sense, it's all the same. They are all different ways of structuring our thinking about it; and our ways of formulating our intentions. The world-as-it-is doesn't care about any of that, though, until we intend. But: some descriptions definitely lead to more productive pursuits than others.

So, basically the reality is not all that malleable as we so like to think and discuss or no one (that we heard of) has yet mastered the practical use of this world view.

Reality - or we could better call it "experience" - is in principle completely malleable because there is no external world or solid thing underlying it. However, if you, say, imagine-that there is a stable world which is persistent and has certain habits, then it's probably not sensible to assume that later a casual "wish" is going to overturn that. Rather, events are going to arise which are "plausible" although unlikely; the outcomes will be overlaid upon those existing stable patterns. The world will not break in response to your intention for a pay rise. So, you are going to have to do some unpicking of the "base formatting" to have completely discontinuous experiences, or completely release your attachment to that so you're not "standing on part of the rug while trying to move it". And you can totally do this. The problem is, it's a sort of not-doing and it can't be thought about, and ultimately you are destroying the coherence of your world experience if you push this. Even simple exercises like the owl exercise can really mess with your sense of structured reality if you push it a bit (because of apparent retro-causality and problems with separating out memories).

Additional aspect: People tend to keep their mouths shut if they get dramatic changes that go beyond "amazing coincidence", because it raises questions about what "you" and "other people" are, and the nature of the "sharing" of the world, and produces a sort of meta-world perspective that doesn't apply in-world. Only people who do things accidentally tend to pipe up. Have you listened to the Kirby Surprise interview linked in the introduction post? Worth a listen. (Also: his book has overlaps with the Anthony Peake stuff, so you might find that interesting.)

Sometimes I've got so tired of all this jazz that I wish I could have the experience of nothing having any experiences

This is quite a good description of that I think. If you've ever done lucid dreaming, you can switch to an experience of "just being" as "void", like that. Thing is, though, eternity is a long time - so to speak - so you will always switch back into a content-based experience "eventually".

Dying is "too boring"! :-)

I've read Anthony Peake also, the other book I think. I don't really go for his theory, but the overall notion of a "private copy" of the world and experiencing continuing regardless (albeit changing in terms of content) would fit in with the overall concept of this subreddit. Anyway - somehow, talking about this stuff makes it seem way more complicated and obscure than it actually is, right? Basically, it's just "the experience you are having right now" plus some direct attending and intending. Any moment can be designated "Moment Number 1" and we can begin from there, forget the previous stuff, the way I see it.

—

Oh yeah, picking up on something you said: I think there is a definite thing where people don't really want to push this stuff, even if there's something they supposedly really desire and they're really into the subject. And maybe that's sensible for some people: lots of folk get quite upset even with the owls or glasses exercises, and they're just about giving you a sense that there is "something going on" that doesn't match your usual description.

Perhaps being "overweight, bald, wear glasses" is, for some, better than having to deeply, truly confront that the world is imaginary in its fundamental nature, rather than just enjoy thinking about it and being an expert in the theory of flexibility? (Can't say I fancy that strategy myself, mind you!)

Q2: *So, you are going to have to do some unpicking of the "base formatting" to have completely discontinuous experiences, or completely release your attachment to that so you're not "standing on part of the rug while trying to move it". And you can totally do this. The problem is, it's a sort of not-doing and it can't be thought about, and ultimately you are destroying the coherence of your world experience if you push this.*

why would i make a reality where i am unaware of the nature of myself - unless i'm doing the 'discovering' now - but that seems silly to begin with what's the point? i suppose when i become fully aware of the immediate nature of (self-created-)reality then i wouldn't ever again be nescient but if i never was - why would i be now?!

Well, you are always your own nature, right? You are always what you are, taking on different shapes. What you are talking about, though, is having a representation of that nature, perhaps? Knowing about it rather than just knowing-being it. But that itself is just another experience!

Meanwhile, there being a "point" to something is an intellectual construct, an idea. Nothing actually has a point; it just is. This goes back to the assumption people sometimes have that the experience you are having now was deliberately, knowingly constructed - like, pondered and chosen and a self-aware manner: designed. But it wasn't. It evolved by intention-implication, basically. Every time you looked, you saw. Having a model, some self-reflection, now gives you the possibility of deliberately choosing, but even that is just more of the same. You don't really know any more about it beyond being; it's just that you've now got a "parallel model" from which to select patterns, also within awareness.

[But that itself is just another experience!] exactly - so why bother? why bother with the experience or the knowledge of the experience when it's so troublesome

It's not about the experience itself, though - after all, every experience is just a shape taken on by awareness. No experience is special, for sure. Why bother? Well...

What is special, is the understanding that an experience gives you. Having a pure "open awareness contentless" experience, or the experience of the facts of the world changing, tells you that your understanding of the nature of the world and of experiences is mistaken. And since your responses to any experiences arises from that understanding, the quality of the ongoing experience is changed. (For example, seeing yourself as a person "spatially-extended place unfolding in time" in markedly difference to seeing yourself as a patterned awareness within which sensations, perceptions and thoughts arise.)

So, the reason to bother in the first place: out of curiosity (since it's not really possible to anticipate the outcome of the investigation). Subsequent discoveries then retrospectively make it worthwhile, since knowing your nature and the nature of experiences makes everything inherently and directly more pleasant - and it's then not troublesome.

right - see - it's just utterly futile on this planet because the inhabitants are utterly devoid of any sense and just keep multiplying like locusts.

What inhabitants? Where? How?

the problem is nothing changes the fundamental pattern of the world.

Nothing changes it if you don't change it, for sure. Just having thoughts about it usually just generates synchronistic experiences about your ideas. You have to intend directly into/as the patterning of the world, to make changes in your experience of the world. You have to be mindful of whether you are increasing/decreasing/shifting the part of your state that is the actual world, rather than a parallel representation you've created about it.

i.e. no experience I'm having is pleasurable and the only planet I know is awful

Your thoughts about "the planet", perhaps. But your actual sensory experience of it? How is that as you describe? In what way, exactly, are you experiencing a world that's crap? Be careful that it's not mostly stories about a world that is crap. Do you need those stories to change in order to feel good? Why? And so on. Basically I'm saying: it would be a valuable exercise for you to pin down exactly what constitutes an experience of the world being crap, since that would your starting point for changing it.

is where lies the importance of that "accepting yourself" business, right?

Just to be clear, though, it's not "accepting yourself" in the sense of psychological acceptance. It's more about not counter-intending against the current sensory moment. To give a mundane example: say you intend to stand up and walk to the door, and this starts to happen spontaneously, but then you don't like the feeling of being automatic because you don't trust it, and so intend muscle tension in order to "control yourself" - you've basically counter-intended the state shift you intended earlier. Now, expand that idea to other changes in the world-pattern. Again, it's sort of "don't stand on the rug and try to move it at the same time".

the closest we've got at the moment as an actual method for doing so is the persistent realms concept, right?

Switch to a persistent realm and never come back? If you pause and think what radical discontinuous change would be like, that's pretty much it, right?

Although of course, you never actually go anywhere anyway - from one perspective, you aren't in the room you are experiencing now. You are never really anywhere; you just have experiences "as if" you are. And in that example, it's only a "lucid dream" because you later have the experience of waking up - it becomes a dream in retrospect (and because you did it knowingly of course and you've heard of "lucid dreams"). In fact, the idea that every morning we wake up and resume the experience we were having the previous day is really just a constructed narrative. The strand is triggered anew each morning - or rather, the morning is triggered anew within a strand. In all cases, then, the basic nature of the unfolding experience is identical, and we make up a story afterwards about its meaning, based on what we felt we experienced "causing". Perhaps the question, then, isn't so much how to generate an experience of an alternate version of the world, it's more what leads us to categorise it one way or another, and what causes us to revert to a previous experience?

I still can't see how something could come out of the "intending but not-doing and not-thinking-about and am-I-really-intending?" thing...

It's just a way of saying that all experiences are results, and intending is the only cause of change. So, right now, just decide that there is a sphere hovering across the room from you. Place your attention in the space where this spehre is. Now, just decide that this sphere has the power to make your body relax and your eyes see more clearly. See what happens. Did the sphere cause the result? Did you experience yourself cause the result? What caused the result?

...More later, but briefly putting aside the "condition of the world" stuff for a moment:

why bother in the first place?

You are personalising something that is not personal. Awareness doesn't "bother" or "make choices" - it isn't any-thing. That little description you linked to is just a metaphor, a little story, a way of poetically creating a sense of playfulness. It's not how it actually is. In fact, there just is no particular "how it actually is". The story of "God forgetting itself" doesn't mean forgetfulness in the sense of personal memory, necessarily.

it seems like a colossal waste of time to go about 'discovering' things i should already know! it's not even enjoyable

But awareness itself isn't discovering anything, as such, and is "before" time and experiences. Rather, it "takes on the shape of" the experience of discovering. The idea of something being enjoyable or not, a waste or not, and the whole notion of "discovering" - these are built upon the pattern of apparently being-a-person-in-a-world. Again, you attributing to awareness things which are actually just experiences made from awareness. In a standard physics description, would you say that an atom was responsible for choosing the shape of the objects of which is is a part? It's a similar argument.

You are like a "material" who which shape-shifts into states and experiences - and tugging on one part of yourself implies a movement of other parts. You wouldn't say that you choose those collateral movements. And in fact, you wouldn't say that you choose the main movement, because mostly you didn't realise what you were doing. Even when you do come to an understanding, that description is actually just a pointer to "that which cannot be described" - because descriptions are also just experiences, and so are choices.

...my comprehension of that turns into frustration at yet-again having to scratch around for something to do or know or experience to move on...

That's the tricky thing. Ultimately you discover that you can't describe yourself because you are the thing that the experience of "descriptions" is made from. But you always are yourself - and what you can do is discover all the things that you are not.

For example, one we come back to: if you close your eyes and "feel out" you discover that "you" are actually everywhere, in all directions. And if you pause and attend to the content of your experience, you find that although you are having an experience of "being here" and the world is "over there", actually they are both made from "you" and are inside "you".

So, if whenever we get lost in thoughts about experience, we can always come back to the actual fact of experience - now. And then we find that our descriptions are all floating as thoughts within that experience, rather than actually describing that experience. From this perspective, a lot of questions actually become meaningless. For instance, "why" questions only make sense relatively within with reference to particular content. In terms of the overall context, they are like "castles in the sky": they are self-consistent sets of thoughts, for sure, but they are just floating in the middle of nothingness, not pointing to anything outside of themselves. You are the sky, and those castles are made from you, and so you can never make a castle that captures you or explains you (you-as-awareness, that is).

If you explore that idea of "things having occurred (or not)" then you have to follow it to its logical conclusion, right down to the details of your personal experience, now, rather than just ideas about the world. Which gives us that the only thing "happening" is your sensory experience right now. There isn't a "past" or "future" other than the thought of it. There's isn't "a world" other than the thought of it. None of the things you are concerned about are happening right now "out there", in this sense. You don't need to get any fancier with the concept than that, I'd say.

One implication of this is, that wrestling with a particular aspect of experience persists it, because an interaction that doesn't have a transformative narrative to it simply implies that aspect all the more strongly. By basic patterning, even, if you spend your days thinking about things which irk you, you are increasing the "relative intensity" of those things, overlaying their patterns upon ongoing experience. In other words, there's a sense in which you have to forget it rather than fight it. You don't ever "solve" a problem - rather, you "forget" the problem and thereby shift to residing in the "solved" state?

Q1: Interestingly now that you mention it, in taking the "thing has occurred" to its logical conclusion, I discover that nothing implies it more than effortlessness, non-doing, and perhaps not even intending to change anything at all. I think in the mind of many of us there is deeply programmed the idea that life is like a steering wheel that we must constantly keep our hands on or it will derail.

My first connection with the ideas behind DJ was with this article [<https://montalk.net/matrix/122/timeline-dynamics>]. The article is from 2006 so I'm sure his views have evolved but nonetheless I think he hits close to the core idea with his "manifesting miracles" guide.

EDIT: I said hands off but meant hands on... witty mistake :P

Definitely agreed on steering wheels!

You're right there is a real problem with the assumption that ongoing experience needs "maintained" - which itself arises from the conflation of the "sphere of experience" with "sphere of intention", perhaps? That is, that the sensory experience I'm having right now is all I can influence and is all that is logged. Actually, it is maybe more accurate to say that my intentions apply "globally" and are overlaid over the entire world-pattern, and the current experience just being the part I am "looking at" right now. (Experiences are apparently local; intentions are actively global.) Because, in fact, you are experiencing the entire world-pattern right now, it's just that only one aspect of it is "unfolded" into 3D-sense, while the rest is "enfolded" or dissolved into the background and only experienced as a sort of "tone" or "global summary sense". Without that idea, we are doomed to continually "tinker" with any outcome that doesn't appear in our senses within a very small time frame, because we never come to understand that the world only shifts when we intend - and that our default should be hands off between intentions. The problem, we can't work this out in advance, because our descriptions have usually been built from just our local observations; we have to take a chance and experiment with intending wide.

Saved that article for later - thanks.

My early metaphor for time was that, implicitly, every possible moment was available, in a conceptual infinite grid (see: time travel version). That itself is related to the configuration/diagrammatic descriptions from Julian Barbour's The End Of Time and JW Dunne's The Serial Universe - although the idea appears in lots of places, including William Blake's "the bright sculptures of Los's Hall". I think it's an old idea that keeps coming up in different ways. It seems that it is hard to make it stick, though, in people's minds?

Q1: I think it's an old idea that keeps coming up in different ways. It seems that it is hard to make it stick, though, in people's minds? Truthfully, I find it quite amazing how certain ideas spread and take hold of large groups of people so fast and so easily (let's take for example, PSY's gangnam style) but some others barely manage to hold any traction. You could say well it's a song and it's catchy and whatever else, but I'm still inclined to think there may be more to it.

I'm inclined to think that also.

Q1: while the rest is "enfolded" or dissolved into the background and only experienced as a sort of "tone" or "global summary sense".

Follow up
This is an interesting concept. The "background felt-sense" perception that you talk about, that we constantly overlook. Tom(author of montalk.net) talks about it on an interview with Jason Demaskis, and even says that it is the most important aspect to reality creation/other things (at around 1:07:46 [<https://youtu.be/X-HB1yc-HUK?t=1h7m46s>], the full interview is worth listening to as well). How to go around changing the most basic/behind the scenes beliefs is a huge topic in itself. In my experience, I have noted how immersing yourself in a video game/film/book can for a time take your "background felt-sense" to another realm. I noticed this effect when I watched the film Interstellar, because you are there in Earth with the main characters and then it slowly progresses to them leaving everything behind and even going to a higher dimensional space. Also after being immersed in a lucid dream for a while I tend to get a feeling of being some sort of indestructible deity which tends to go away after a while of being awake in the "real" world. Still, how you said, there's something that pulls you away from maintaining those "background felt-sense".

It also comes up in the philosophy and psychology aspects of Eugene Gendlin's work. He talks of a felt-sense for navigating one's current personal situation. However, as with the intending of outcomes more generally, if you approach this as the "dissolved state" of everything - the "global summary" of the entire state of you-as-awareness rather than you-as-person - it's actually much more that. It's both a huge topic, and not: in the sense that it's like having a pond with all the objects of the world in it "stored" in the same way, and therefore the same approach applies universally. The felt-sense actually is the world-state (all of it over all time), and your sensory experience merely corresponds to aspects of it that you have "unfolded" into perception. This means that you are literally experiencing the entirety of the world right now. Which is obvious, of course: since there is no "outside" to you, there's nowhere else for it to be, anyway. I actually think one of the things that defines a more "successful" film, is that it paces and leads the audience by creating a subtle felt-connection with them. It leads their felt-sense to become an ongoing global sense of the film as it unfolds. This is why there is a difference between films which are "designed" - a series of set pieces with connective filler in between - and those that are "woven" - a situation that evolves as the film progresses. It the former is like stamping an idea from nowhere onto the film; the latter is like drawing a thread from an idea and weaving it into imagery.

Note, both types of film can be enjoyable - but the "designed" film tends to like a fairground ride, where you're always aware you are watching a film, can feel the mechanics; you don't become so immersed in the story or characters. The "woven" film is an immersive world and leads you to be the film's world for the duration. For example: even if you enjoyed it, you can perceive that The Force Awakens was a "designed" film. It felt somehow shallow, like a sequence of scenes one after the other, and for a world-building franchise it somehow lacked "awe"; the making of the film was very evident in the final experience. Meanwhile, Interstellar definitely had its problems with characterisation and dialogue, but it absolutely absorbs you in a way that The Force Awakens does not.

Q1: I definitely feel what you mean in your example. While I don't read ASoIAF a friend once showed me a quote from the author which definitely resonated with me:
==It is true that I spend a lot of words in my books describing the meals my characters are eating. More than most writers, I suspect. This does draw a certain amount of criticism from those readers and reviewers who like a brisker pace. "Do we really need all that detailed description of food?" these critics will ask. "What does it matter how many courses were served, whether the capons were nicely crisped, what sort of sauce the wild boar was cooked in?" Whether it is a seventy-seven-course wedding banquet or some outlaws sharing salt beef and apples around a campfire, these critics don't want to hear about it unless it advances the plot. I bet they eat fast food while they're typing too. I have a different outlook on these matters. I write to tell a story, and telling a story is not at all the same as advancing the plot. If the plot was all that mattered, none of us would need to read novels at all. The CliffsNotes would suffice. All you'll miss is . . . well, everything. For me, the journey is what matters, not how quickly one can get to the final destination. When I read, as when I travel, I want to see the sights, smell the flowers, and, yes, taste the food. My goal as a writer has always been to create an immersive vicarious experience for my readers. When a reader puts down one of my novels, I want him to remember the events of the book as if he had lived them. And the way to do that is with sensory detail.
Now... the big question right now is, what effect does it have in one's immediate reality? If I read a lot of novels about civil wars and harsh survival conditions, enough that it alters my "felt-sense" of the world deep down, does that synchronistically nudge events in my life towards making me experience something like that? In some cases, I have noted a sort of "owls of eternity" type situation in which I run into more content relating to that particular felt-sense. The above question is important because it's a popular idea among "truthers" that movies & tv shows are used as a tool of "cultural modulation."

Great quote. Yes, I'd say that fictional content does result in a "patterning" of our ongoing experience too. And, this becomes ever more obvious if we relax our hold on our state and release our spatial attentional focus - because then our "thought strands" and "main strands" of experience are no longer so divided: to summon an image in strand is to overlay it upon strand. However, because of the nature of experience, I don't think it would be useful for "cultural modulation" by others onto you, since both the experience and the "modulation material" occur within you-as-awareness. You'd be doing it to yourself, really, in a fundamental sense anyway. For a classic read on patterning by fiction, check out Philip K Dick's essay: How To Build A Universe That Doesn't Fall Apart Two Days Later.

...

[Previous Edit] ...even there is no intelligence behind it, I - the character having this experience - am not acting fully consciously, or alone at all, as some people may understand this.

Well, you are never the character, you are always "awareness", but that doesn't mean you do what you do knowingly - by which I mean, having a parallel understanding in thought about what it is you are doing, or somehow pre-experiencing the results in detail beyond the specific intention. So, if you specify a particular outcome - say, intend an exact scene - then that is like you are defining the scene as fact by intensifying its contribution to the world. Now, because the world must "make sense", its pattern will simply by its nature shift to accommodate that coherently. You are the only intelligence, but that doesn't mean you have a thought-based knowledge of what it will be like to experience that world, beyond the intention, in advance. You won't know the details of the implications of that intention, until you encounter them subsequently. And if you don't even have an understanding of what "intending" is, you'll be even more confused. You are the only intelligence and the only power - but that doesn't necessarily mean you understand what's going on!

Which is what this subreddit is about, basically.

Dumb Patterning Aside: This is like if a mountain doubles its height in a landscape, the landscape doesn't have to "work out" or "know" how to incorporate the mountain, it is shaped as part of the change, just from being a continuous landscape. Now, imagine that you are a person on top of that mountain who "intends" it to double in height. Because you did the intending, you know the state of the mountain as it appears when unfolded into the senses. However, you don't necessarily know the state of the rest of the landscape, because it is not (yet) unfolded into the senses.

[Neville] didn't go all psychological about the past

Definitely I'm talking about actual world change rather than just psychological change - but: in this description of experience, it becomes hard to really say what "psychological change" means, and "the world" doesn't mean quite the same thing as it normally would. We're always talking about our ongoing experience, which arises within awareness, and there's no fundamental distinction in type between different aspects of experience. However, if we say that "the world" is our main bright 3D-immersive multi-sensory strand of experience, and "psychological experience" is the strand of thoughts and body sensations, then it's clear what we're wanting to change, and that we must intend appropriately - i.e. intend to the pattern of "the world" rather than any parallel thoughts about the world.

There's no trick to this, you simply make that your intention; it's like choosing to move your left hand rather than your right hand. There's no "way" to do one rather than the other. But as in that example, describing it in words makes it sound way more complicated than it is; it just is.

*A1: I don't quite understand what is it that you're wanting to gain from this though?
On the one hand, it seems as though you're interested in the idea of changing your experience, but then as soon as you get that idea out there, you immediately shoot it down by condemning pretty much 99% of the people on the planet because you have some preconceived notion that the entire world has gone to shit...?
Remember that the way you're interpreting the world and people you know of directly impacts your experience within this life. What do you mean by fundamental pattern of the world? All changes tug at the strings of every thing else in existence, based simply on your changing of intention - so you have total impact over everything, as does everybody else. With that being said, some things are unlikely to change because something far-fetched would not make sense or serve you or those around you in any logical way... thus it is far-fetched. If you're wanting to experience a world that you feel better about, you need to choose reasons to feel better about it - your interpretations aren't something that happen to you, they happen from you, and they help mold your personal experience... regardless of how 99% of the rest of the human species behaves. Remember that humans are a minority of all the beings on the earth - and every single one of them has awareness, although their consciousness may be focused differently than a human's.*

POST: [Two Glasses Method] How do you really know which words to choose?

The one that feels more right, perhaps? :-p

Really, it's not "right" as in "correct", it's "right" as in "appropriate" - feels like the situation, not feels like rightness. The purpose of the word is purely to provide a "handle" onto the situation. There are many different possibilities that could fulfil this criterion, but that doesn't matter. It's about what the word is pointing to, attached to, rather than the shape of the pointing.

TL;DR: Don't overthink this and fall into italicised "whataboutery" - after all, how can we really know whether our questions truly matter in actual experience, and which questions would be the right questions to ask?

*Q1: Really, it's not "right" as in "correct", it's "right" as in "appropriate" - feels like the situation, not feels like rightness.
This reminds me of a scene in True Detective in which the character (Rust Cohle) talks about "smelling the psychosphere" and he comments how it feels like "aluminum and ashes", kind of exposing the way he "felt" about the world. Interestingly, if you've watched the show's first season, you'd notice the aluminum and ashes thing was pretty prominent during the season with several scenes in which the character(Rust Cohle) is shown drinking/using cans of beer (aluminum) and smoking (ashes). It's worth noting how he assigns this meaning to the world around him, but it really describes himself more than the world.
Found it! [<https://www.youtube.com/watch?t=3m30s&v=A8x73UW8Hjk&feature=youtu.be>]*

Ah yes, that's nice. I hadn't noticed the aluminium and ashes theme running throughout the show for Cohle's worldview (and world-sense) when watching it, but you're right. That stuff is why I much preferred the first season; while second season had other flaws, it really suffered from not having such a well thought out character perspective.

POST: If Dimensional jumping is real, how this subreddit works, then?

It is more accurate to say that we all are different dimensions, not that we are in them. A "dimension" can best be thought of as a particular "state", corresponding to a particular set of facts or patterns. As to what this means for "us all", that doesn't translate easily (or at all) into conceptual thinking, but the Hall of Records metaphor does provide one way to approach this.

Is there any experiences you created that were succeeded through the "hall of records"?

Well, the Hall of Records is intended primarily as a way to conceive of how experience is structured, as an alternative to the usual "independent people in a spatially-extended place unfolding in time" worldview (which is itself just a metaphor, of course). It does provide another way to conceive of experiences and outcomes, but it doesn't cause any as such - only intention does/is that. However, even just adopting it as a perspective does tend to loosen things up a bit, make everything much more dreamlike, particularly with "other people", but more generally you'll have experiences that are more like exploring "associative thinking" than a solid mechanistic place. Just try absorbing and intending the metaphor as "how things are", and see what happens?

To emphasise again: the exercises and techniques, if we want to call them that, never do anything in themselves - rather, they are a way of structuring intention, either directly or implicitly.

POST: What if someone I know does it? What happens to "my" them?

I care for my friend very much and I don't want to lose him. I know it isn't a physical body-switching thing, but if "he" goes to another dimension, what is left here? Does he vanish? Is what remains in his body a version of himself that didn't succeed in jumping? Does he switch with the version of himself in the dimension he jumped to?

So, in fact I'd say that your issue isn't really about what happens to him if a jump takes place - it's about what he (and you) are now. Basically, it doesn't work that way. You have to think of everything in terms of your own subjective experience. If you experience him doing a jump, then it is really your experience of him performing a jump - it is part of your "world-pattern" and is an outcome or implication of your own intention. Your friend doesn't go anywhere, because there is no "person" behind/inside your friend - he is made from "awareness", currently as images and sound and so on, patterned. Similarly, you are not a person either: there is no "person" behind your body, you are "awareness". Right now, "awareness" has taken on the shape of the perspective of you-as-person. You feel that you are you-as-person, but really you are always "awareness" and have "first cause" influence as a result.

It's like this is your "private copy" of the world - at this moment. There is no "outside" to awareness, and there is nothing "behind" the experiences you are having - except awareness. It's all you-as-awareness. Some other "time", "eventually", you-as-awareness might take on the shape of your friend's perspective, and have experiences from that point of view (and be mission controller in exactly the same way, but perhaps not realise it). But for now, you are effectively the god of your own copy of the world, and there is nothing else because it is made from you.

TL;DR: You can ponder a lot of metaphysics, or you can simply accept that it just doesn't work that way and so there's no need to worry.

*Q1: Right now, "awareness" has taken on the shape of the perspective of you-as-person. You feel that you are you-as-person, but really you are always "awareness" and have "first cause" influence as a result.
this is why key exists in different 'places' at the same moment - it's just awareness condensing into certain forms*

As soon as we start talking about multiple "moments" or "places" though, we are making an error. It's not that it's wrong as such - it's that it is meaningless, in the sense that this cannot be talked about conceptually. "Moments" and "places" only exist as an aspect of, part of the formatting of, an experience, and not outside of it. "Awareness" itself has no inherent properties other than being-aware - and so things like division, multiplicity, location, place, space, time are things that awareness can "take on the shape of", but it is incorrect to talk of those "shapes" being "in" a place or time, and so on. But so long as we keep in mind that we're talking metaphorically - and that although we might even pattern our experience with those metaphors ("active metaphors") such that we have experiences "as if" they were true, they are not fundamentally true - we get the best of all (ahem) worlds.

The main reason I bring this up in such a pedantic way, is that recognising this frees you from trying to wrestle to understand this - that is, create a parallel construction in thought which corresponds to it - because it is not actually possible. Again it's like trying to build a sandcastle which captures both "the beach" and "sand" - it is those two things, but it cannot contain them, and can never be identical with them. Descriptions and "understandings" need to be recognised for what they are: yet more experiences, on the same level, and not something which gets "behind" experiences.

couldn't that be all placed within one 'strand of thought' - i.e., a strand of thought that contains all the possible apparent multiplicity

I'd say that all the possible apparent multiplicity is within awareness, but of course you could have an experience "as if" all multiplicity is within a strand, perhaps even in some visual way - but that itself would be a selection from all possible patterns. We're really just tinkering with concepts here. There's only ever really "experience", and "strands" are just a nice way of talking about a certain type of overall experience where things seem "parallel".

yes, because there is no objective time in the universe - only relative time, which disappears as soon as i create a new 'experience'/'scenario'

I'd agree. "Time" is a concept, "change" is an aspect of an experience and doesn't "happen" outside of that experience, in the same way that a contour doesn't happen independently of the mountain, and a stream doesn't happen independently of flowing water, etc.

intending to eliminate all errors in perception

What counts as an error in perception? To me, I suppose an error in perception is to think that there is something "behind" experience. If one perceives an experience as being awareness and recognises that thoughts arising with that experience are also awareness, then one is not in error, since one recognises the true nature of the overall experience.

right, that is where one gets into an infinite loop of trying-to-apprehend that-which-cannot-be-apprehended and end up creating more and more fictitious scenarios without actually solving anything

Right - all at the same level, while incorrectly thinking that you are getting deeper into some hierarchy. Like seeing a coffee table and, examining it more closely, seeing wood, wood grain, molecules, atoms... but you are not getting deeper really, you aren't getting "behind" the table; you are just having different experiences at the same level.

...
We should bear in mind that "worldlines" and so on are just metaphors. You might have experiences "as if" there were such things, but there are not, in fact, lots of people in different threads. As soon as you envisage something in "diagrammatic" form in the 3rd-person (the "view from nowhere") you are immediately "wrong", in the sense that there no such underlying basis to experience - the though of it is itself just an experience, still within your perspective. You never get "outside" of you-as-awareness. Having said that, if these ideas are appealing and you absorb them, they can be useful for creating a worldview you like because it feels the most appealing and "understandable", or even to pattern your experience. And it does fill a placeholder when it comes to the unthinkable issue of "what are other people in terms of jumping". However, these descriptions are never "how things really are behind the scenes" (because there is no "behind the scenes"). Keeping this in mind helps us retain our flexibility of both thought and potential.

The Hall of Records metaphor tries to fulfil that purpose. A metaphor can't be right, but it can try to avoid or indicate the unavoidable error that results from trying to think about something that is "before" thought, is "before" the formatting of division and multiplicity (which are aspects of experiences, not aspects of the-world-as-it-is, necessarily).

...I guess it would be good here define what is meant by a "reality" and what is meant by a "you"? What do you mean by those terms? I think that's probably the root of our disagreement here (if there is one, and actually there might not be, fundamentally).

However, let's try -

However, you might be talking about the concept/pattern of which I was applying to reality. You'd be right in thinking its wrong (it probably is) but wrong in thinking theres no basis for this idea. Reality itself serves as the basis for all ideas.

Okay, so if by "reality" you mean "the main strand of experience", then what I would describe as "jumping" would be the imposition of a pattern onto that main strand. Essentially, "intensifying the relative contribution" of that fact/pattern in one's state, and there one's ongoing experience. Ideas for such patterns might arise in the main strand or in any parallel strands (by which I mean: thoughts). Basically, they come from experience in any of its aspects. I usually avoid the word "reality" because I think it's become quite a messy term that gets used for lots of different things, but I would say that perhaps: what is real is that which does not change. Following from this, the only thing that is "real" is "that which is aware" and "takes on the shape of experiences". The only facts that are always true and can be checked at any time by attending to direct experience:

- What I am is that which is aware - a sort of "material" whose only inherent property is being-aware, and which is not an object, and has no "edge" or "outside".
- I am having an experience, and I am aware of having an experience.
- Those experiences I have are "made from" me - I am that which "takes on the shape of" experiences.

These are really the same fact, of course, once you strip away the duality that language has introduced. So that leads to: reality == awareness.

No, because it [the senses] tells us there IS something outside our awareness.

Does it, though? Even your thought about an outside, is inside. We might say that not all of our experience is expanded out into a 3D multi-sensory format.

Your ideas on the nature of reality are simply an interchangeable metaphor just like mine is.

The important thing is, though, that it recognises itself as a metaphor - and that the-world-as-it-is can never be captured in a metaphor, because it at the same level as a metaphor. It seeks simply to be the most flexible way to describe patterns. It's not intended to be a theory of "how reality works" - but there is no "how reality works". The idea of there being a "how things work" exists in thought, not in the world.

It is a usefull patern used to trick your brain out of its own current patterns to test the boundaries of reality and cause changes.

What brain?

But you're right: the ultimate point of any metaphor is that it allows you to conceive of experiences that you could not formulate otherwise, and that having done so your intention will also intend that worldview by implication. World lines are good for that too - but we should be careful we don't start viewing them as "true" in some fundamental way. One might have experiences "as if" they exist one day, and then have experiences "as if" they don't another day. The way in which they exist, then, are as patterns of experience, not "out there" in some independent way.

The reason I go with the worldlines theory rather than your own is that their appears to currently be more data supporting the idea of mutliple realities...

What data? By which I mean, when pondering this sort of thing, what would or should count as data?

You're right: all we can prove (to ourselves) is the nature of our direct experience right now, plus infer from the experiences we produce what the limits are. Taking the two together, I suggest the is no stable truth in terms of objects or patterns. There is no solid underlying persistent substrate at all in that sense.

First Cause may be casued by awareness or it may not be. It may seem like First Cause is a concept that exists due to or awareness but since our perception of reality is flawed we can never say for sure if we were the ones behind the First Cause or if it was some other entity/pattern (or even that there isnt a First Cause).

First cause isn't "caused" by awareness, though: it is awareness. It's a phrase to describe that awareness is self-modifying - like a shape-shifter, you might say. Nothing "causes" awareness to change, and any apparent causes and effects you observe are in fact all "results" in that sense.

We could imagine this as being like a landscape of "moments" which can reform itself into a new pattern. A walker who explored the landscape subsequently would encounter one feature or moment, then another. To him, it might seem as if one feature "caused" the other feature - but in fact all features would be a result of the reshaping of the landscape: "first cause". (Note: the metaphorical landscape here would be a full static definition across all moments; and even "time passing" would be a static pattern, actually.)

I'd add that it makes no sense to talk of some other entity/pattern in this context. Those would be apparent interactions, but both the entity and the object it operated on would be aspects of the patterned landscape. The entity wouldn't cause anything; it's apparent actions would be a result. That's how I'm thinking of this, anyway.

EDIT: Quite a long reply but the first chunk is my main response to your points. The second chunk is an attempt to give a very loose outline of the "patterning" description. Thanks for the discussion!

Main Responses

Causes and Awareness

What I guess I'm getting at here is that if we are indeed aware there's something we have to be aware of that would cause this awareness.

I'd say that this is exactly where the "solution" lies, for want of a better term. What can cause awareness? Note that by "awareness" we have to be careful, and I deliberately don't use the world "consciousness" because that word has been kind of ruined. Different meanings of that word tend to get mixed up: namely "consciousness-of" (being aware of an experience), "self-consciousness" (identifying with a certain part of experience as "you"), and "consciousness" (a non-object material that just is). I'm referring to something like the last one here. So by "awareness" I mean a sort of non-material "material" - basically "that which is". It isn't "caused", it just "is". In fact "causation" is something at is "after" or "made from" awareness. Since awareness has no inherent properties other than being-aware, it makes no sense to talk of it in terms of spatial or temporal characteristics. Nothing can cause awareness, and nothing can cause experience.

Unfortunately, language and thought are themselves contents of experience, and although awareness itself is not an object, the contents of experience are. This is why we can't really formulate a description of awareness or think about it. It never "makes sense" in those terms. We can only be it and directly know/realise it. And that, actually, is how you come to adopt this view: not by working it out intellectually, but by attending to your direct experience as it is, and recognising its properties. Right now, you could pause a notice that - even thought you are having an experience of apparently being "over here" while this screen is "over there" - that in fact you are located "everywhere" within experience, and that your experience has no edges. For example, pause and direct your attention at these words. Now, direct your attention to "the place you are looking out from". What do you find there? Now keep going. What do you discover?

I also think that our definitions of "first cause" were somewhat different leading to some confusion...

Ah, right. I understand where you were coming from now.

Truth Behind Patterns

Altogether though I think it comes down to a fundamental disagreement: you believe there is no "truth behind the patterns" while I maintain there is. In the end I would argue that both methods are flexible enough to be perfectly valid. Let us just agree to disagree.

What I would say though, is that the patterns are the truth. Actually, what I'd say is that all that is true is "awareness" and the shape it has taken on. There is nothing else. If there was a "behind" to a particular pattern (made from awareness), then that "behind" would also be a pattern (made from awareness). It's a little like, no matter what thoughts you have about the world or about an "outside" to awareness, those thoughts are still themselves within and made from awareness. Thoughts about experiences are themselves experiences. Right - all at the same level, while incorrectly thinking that you are getting deeper into some hierarchy. Reusing an example: It's like seeing a coffee table and, examining it more closely, seeing wood, wood grain, molecules, atoms... but you are not getting deeper really, you aren't getting "behind" the table: you are just having different experiences at the same level. So we don't necessarily have to "agree to disagree" I think, because we are talking about slightly different things. Although I am saying that awareness has no inherent structure, that does not mean we do not at present have an accumulated structure from all the various intentions and their implications to date.

This description doesn't say there is no format or factual aspect to things - it simply says that all formatting and facts are open to amendment, and that this is possible because all current structure is you-as-awareness "shaped" into a particular, and the only true causal mechanism is the shape-shifting "first cause" ability of awareness to adopt a new state. If this were not the case, neither experience nor amendment would be possible (how could you interact across a boundary of type? how could you experience across a boundary of type?). So, we can absolutely adopt "world lines" as a pattern and have experiences "as if" they were true. And we can also adopt "a infinite gloop of all possible moments" and have experiences "as if" that is true. The default pattern for most people is: "independent people within a shared spatially-extended place unfolding in time", and so they have experiences "as if" that is true (and then think we are crazy for talking about all this stuff, fair enough!).

Outline of a Model

Anyway, I hope that's a bit clearer. The very loose bullet-point outline for the "patterning" description would be something like this, written as assertions for simplicity:

- What you truly are, is "awareness". Or for poetic purposes: an "open space of awareness which takes on the shape of states and experiences" and whose only inherent property is being-aware.
- Dissolved within this awareness are all possible facts, patterns and experiences - which exist eternally. All possible patterns are present and active within experience, always.
- Awareness is always in a particular "state" - even if that is a flat state where no patterns are dominant, corresponding to a "void" experience. A state includes all base formatting (including apparent time/space aspects), perceptual formatting, world facts, events and so on. This state defines the facts-of-the-world and hence your ongoing experience.
- A "state" can be said to correspond to a particular distribution of relative intensities of patterns. We might say that awareness "takes on the shape of" a particular state and hence a fully-defined state of experiences. This can be imagined as a sort of "landscape" which defines all moments across all time. "Time passing" is itself a static pattern, which can be likened to a fixed trajectory of attentional focus across a the landscape of moments.
- A "state", then, is fully defined and fully deterministic.
- However, the landscape can be "shifted" by altering the relative intensities of the constituent patterns. This amounts to awareness "taking on the shape of" a different distribution, hence a different state with a different deterministic set of moments. (This is where things like "dimensional jumping" fit in.)
- Such shifts are done by "intending". To "intend" is to increase the intensity of a particular pattern ("the intention"), either directly or by implication.
- "Intending" amounts to something like "thinking the fact of something being true", but it is not a thought with an object as its target - this is an unbounded "objectless, subjective" thought: one thinks it by "bringing it to mind" or "selecting the pattern" or "contemplating the fact". One is "adopting the shape of" a state that incorporates that pattern. There is no technique to intending; one simply intends. (It also can't really be described!)
- Practically speaking, one often tends to intend by implication, using misdirection. That is, one performs some mental or physical task (which is itself intention!) with the understanding that this means-that your target pattern is true. Examples can actually be as simple as simply "asserting", "declaring" or "commanding" that something is true. All it has to accomplish, is triggering into prominence that particular pattern by implying it - without obstruction.

- The world, then, is essentially a persistent or maintained thought of a world, shaped from awareness, which can be revised by thinking of a different world, again as awareness.

Again, note that the model isn't "true" - what it aims to do is be the most generalised description for structured experiences, the minimum model that "makes sense" can be thought in terms of. It captures the maximum scope of "as if" experiences and allows them to make sense, by going to a "meta" level that is "before" the world-pattern (but "after" awareness, of course).

To emphasise: what is inherently true is only ascertained by directly attending to experience as it is, now, and not by thinking about it. Which is why people meditate and stuff. But I think you can infer this understanding by repeatedly adopting a worldview, noting that your ongoing experience tends to fall in line with it "as if" it were true, until it becomes clear that there is no fundamental "how things are" or "how things work", other than the fact that you are 'that which is experiencing and experience'.

Whew. Okay, I think that covers my perspective as best it can be covered at present. It's nice to be pushed to clarify things anyway.

POST: You don't need a technique (and other patterns)

Soon enough this sub will abandon methods and rejoin the common use of the law of attraction.

...and then soon after that, someone will start a subreddit based on a metaphysical model again, because the attempt to follow "the law of attraction" quickly descends into near-superstition, in my experience. The law of attraction neither commits to a model, nor fully commits to the arbitrariness of all models. It's not the methods that matter generally, and that isn't what distinguishes what we discuss here. Rather, it's the clear and specific patterning of intention - and by extension any properly formed model or internally consistent technique - combined with an underlying focus on the broader nature of experiencing, and the ongoing exploration of those things.

I'm curious, were you the one that created the two glasses method and was it based on the law of attraction? Do you still use the two glasses method?

I did create it, as a response to a post over at /r/glitch_in_the_matrix asking for ways one might deliberately generate a "glitch". It wasn't based on the law of attraction - it was based on the pattern that underlies this description. But of course, everything, even moving your arms and legs, is based on (or rather is) structured intention and awareness, so there's a common root to all of this. The idea is that if you get familiar with the owls and glasses exercise, ponder them along with the metaphors given, then you have pretty much everything you need to be your own expert here.

POST: Another newbie, another "what is it all about?"

Still, it is not very clear what you are trying to do here.

If it's about anything, I'd say it's about putting aside assumptions and exploring things. The childish exercises, then, are simply ways of demonstrating to ourselves that our everyday assumptions are perhaps not particularly accurate, and triggering contemplation and further experimentation. So, basically, it's about having a questioning attitude, particularly about the default metaphor we use to describe the world (that it is a "shared spatially-extended place unfolding in time").

This all stuff is nothing at all special, this is just how our machinery of brains work.

Really? How does the "machinery of brains" work? (Please don't say it's an information processor!)

I have weird things happening to me from time to time. Doesn't mean anything special, everyone has their own share of weird stuff.

Well, it might mean something special. If you don't have a detailed description of how, exactly, "weird things happening" works, then who's to say, I suppose?

As far as science is concerned, all the experience we feel happens in our mind

What's a "mind"?

If you "jump" from this body, it shouldn't at all affect that body's brain, so it won't disappear from reddit.

The idea that you "jump" from a body is perhaps incorrect. That's not what is meant by a "jump". Even the idea that you are "in" a body is suspect, surely. And what would the "you" be that would be in it, anyway? I'm not sure what the link between this and "affecting the body's brain" is?

This reminded me of tulpamancy, except that tulpamancers know that it's all in their heads.

Didn't you just say that everything was just in our minds?

Come on, if you really dig deeper, you shouldn't even have a desire for a personal gain, since such a desire is also a mental construct you try so hard to eliminate.

Why shouldn't you have desire for personal gain? What is a "person", anyway? Why should you eliminate desire? And what's a "mental construct"? This sounds a bit superstitious, more than anything!

I'm interested in figuring out what consciousness is...

That does contain a hidden assumption that consciousness is a "thing"...

But immediately got frustrated by the amount of magical thinking.

...and actually, I'd say one of the things this subreddit does is explicitly try to avoid magical thinking, by unpacking it. It endeavours to take a step back, and instead of making assumptions about the content of experience, considers the context of it - that is, directly or indirectly explore questions about "the nature of experiencing" itself, and what the relationship is between experiences and narratives. In other words, to call into question not only "how things work", but also what it even means to talk of a "how things work" - as well as what you-as-experiencer is, and so on. Mostly, it's just people having some fun, though, of course, and not getting too arrogant about it! :-)

TL;DR: It's about exploring our experience, without presupposing anything, including the idea that we are exploring our experience...

Q1: Valid questions you ask and valud attitude you have. That's why I got excited once encountered this sub. Yeah, hard to say what is "mind", "consciousness" etc, this is why it is important to be open-minded. But what I see in the threads of this sub doesn't correspond to this spirit. You say you "unpack magical thinking" - I see people focusing on the procedure of techniques, not their essence. What struck me most is that some here apparently believe that they can travel in time or to parallel worlds if they focus hard enough. You are talking about being open minded and trying to understand things, while what I see is people believing they can achieve certain supernatural stuff and trying to do that. Yeah, supernatural stuff is unquestionably cool, but so many people already made the mistake of believing they can achieve it with none of them actually achieving it.

I think all of that is okay, though. Focusing on techniques, well that's the default approach for most people in life. In seeking to find a way to generate a result, they can find their way into a larger subject, as they contemplate the questions raised by the experiences they have. And things like "time travel" and "parallel worlds" - as ideas they are interesting things to take seriously, since they are like extreme versions of the concepts of "time" and "place" that we take for granted. We are led to cast a sharper eye on the nature of ongoing experience as it actually is, which can result in us seeing that many everyday assumptions don't really correspond very well with what we actually encounter in and as the world as it is lived.

The whole notion of "supernatural stuff", for example, might in the end be recognised as a bit of a meaningless category. You experience what you experience, the narrative that accompanies it is something else, and the idea of a "belief" might also collapse at the same time. Trying to achieve supernatural stuff, then, as a way of exploring the limits of experience, is as valid an approach as any other - provided it is pursued in a structured way. It can be quite revealing about what constitutes an "explanation" for an

experience. So, yes - it is important to be open-minded, but for it to be worthwhile, you have to be completely open-minded. Now, this isn't about saying "hey, maybe magic is possible" or that sort of thing; it's about being able to accept that very fundamental concepts might be relatively true only. Perhaps even be willing to entertain the notion that there is no stable platform at all, no observer position from which the rest of experience can be considered at arms length.

Anyway, as the sidebar emphasises: we shouldn't accept something unless we have personal experience of it; we shouldn't dismiss something without personal experience of it; the "open verdict" or "null view" is the default. This guards against attaching oneself to the wrong answers, but also against committing oneself to the wrong questions.

Could be one of the ways to explore your experience, you're right. But...

Yeah, there is always a conflict when one is drawn to pursue a line of thinking because one is seeking a "non-standard outcome" with a strong emotional context, rather than "just" because one is interested in exploring "how things are". The two overlap, of course - however, it's not easy to balance saying that nothing is impossible in principle, but also emphasise that although investigations could lead to interesting discoveries, those discoveries might not lead to the desired outcome. The answer is, I think, to be completely sincere.

Endless stream of reports from people, most of these reports of no real value.

In what way are they of no real value? Generally, I'd say the value is in the discussion, not the posts themselves. This even applies to this conversation!

Shouldn't we at least try to categorize the experiences or filter them?

Categorise experiences on what basis, though? Categorisation implies a purpose. But a purpose implies a worldview. What worldview would the subreddit adopt?

Generally, the subreddit is quite careful not to advocate an official worldview, because a worldview suggests that there is a fundamental "how things are" and "how things work" that is there to be discovered (in the sense of there being a persistent underlying structure, that is). One of the essential ideas of the subreddit is that this is not necessarily true. (This is a sort of "meta" worldview though, of course.)

EDIT: See also this related comment [POST: What does r/occult think of r/dimensionaljumping], perhaps.

Q1: *Generally, I'd say the value is in the discussion, not the post themselves.*

I would make a thread but that seems egotistical to me and I see your discussion as reflective of my experience anyway because the world is my experience~

Yes, and that's fine. The submissions are there as a sort of host for an ongoing conversation, centred around the general topic as outlined in the sidebar, which continues across all posts. That's why it's okay that the same things come up again (the responses will be slightly different this time), and there's no "knowledge" that is being accumulated and fixed (which isn't as important as one might initially assume, as you know).

TriumphantGeorge Compendium - Part 10

POST: Any help?

This is probably one for /r/Glitch_in_the_Matrix, since it doesn't involve any deliberate attempt to make a change or experiment (the focus of this subreddit). As a general thought, though, when we find ourselves asking what something "really is" - e.g. is a dream where you aren't looking out of a bodily perspective "astral projection" - I'd say that what is "really happening" is whatever we are experiencing: the sensory experience is what is happening, with no true explanation "behind" it. Any descriptions or explanations we come up with, are parallel to that. So, someone might say "that's astral projection", but when you push deeper, "astral projection" will turn out to be just "the experience of apparently not being in a body" + a little story we made up. Similarly, someone might say that right now you are "an individual person walking around a shared, spatially-extended place unfolding in time", but that too would be a little story. This is the essence of the subreddit, perhaps. See: the "imagination room" metaphor, for example.

...Hey, I remember!

So, my issue with those explanations isn't that they aren't useful or can't fit, it's just that they are promoted as being "what is really happening" rather than a metaphor (in the same bag as the "brain is a processor" metaphor and so on). They're a starting point, and it's only a problem if people interpret them as a conclusion. (In fact, I contend that there is no "what is really happening" in that sense.)

For OP, we can create metaphors in terms of "databases" which are "calculated" (but what "time" would that calculation occur in, since it can't be the same "time" that experiences occur in?) or a selection mechanism from static patterns (no calculation required, but where does mechanism reside?) and so on. These are all useful ways of thinking about things - and they are fun to play with - but they don't really explain things beyond providing a little story which fills a gap. They can't be used to make a prediction, for example. They are not "true" in a deeper sense. That "true in a deeper sense" is what is interesting. So those metaphors are a starting point for exploration, but mainly, in the end, they are a starting point for recognising the nature of explanations vs the nature of experiencing. (In my view, of course!)

that happens when your consciousness accesses the "future probable database" as Campbell calls it.

That sort of thing is good for triggering questions, definitely. For example: What is "consciousness"? In what sense can consciousness be "yours"? What is a "future" exactly, and in what way can it exist? What does it mean for consciousness to "access" something? In what way, by what, and where and when, are patterns "calculated"? The attempt to answer those questions is what makes the description useful, I think, rather than the content of the description itself.

In the end, I anticipate that where people get to is that descriptions don't matter at all for living life, except as a way of formulating intentions.

You're right, it's just inherently impossible to correctly explain a reality by using patterns from the "sub-reality"

Yes. I'd emphasise, though, that it's even more basic than that might initially suggest. That is, even concepts such as "reality", "sub-reality", the idea that we are "in" anything, that there are "higher" or "lower" realities, "physical" or "non-physical" - all suffer from the same problem. Which can be summarised as: thinking is itself just another experience, at the same level as any other experience. Even thoughts about "an outside" are also "inside" experience, including the notion that anything is "happening" other than the current experience, or the assumption that the formatting of experience (spatial extension and unfolding in time) corresponds to the format of... that. Glancing at that post, yes I'd pretty much agree with it, as far as it goes, and I have gone through the book. (There wasn't that much in it for me in that "a-ha" way, but it's a thorough description of that sort of structuring approach, and I found his personal history interesting.) But then: does it actually go anywhere, really? This applies to my own descriptions also.

Consciousness can do whatever it's capable of.

We always end up with tautologies like this: it all just is, is the conclusion. [Pasting from a comment elsewhere:] We can think about this forever, but it's really something that is directly realised. For example, we might close our eyes and try to:

- a) find the "edges" of your current experience,
- b) find where "you" are in your current experience.

and:

- c) investigate what your current is experience is "made from".

Those observations are the facts. Everything else must adhere to those facts. The conclusion is super-simple, but it's not object-based and so can't be described at all, only pointed to. But we can try with something along the lines of:

- *What you truly are is a non-material "material" whose only property is being-aware, which "takes on the shape of" experiences, and has all possible experiences "dissolved" eternally within it.*

Or similar. Beyond this, we end up just trying to create the most minimal description that includes the fact that "experience is structured in some way", while avoiding including errors by referencing any material, spatial or temporal terms.

When you pick everything apart, it seems to come down to just that. Awareness being aware of things.

And perhaps more strictly speaking: Awareness being aware of itself as things. Or rather, as the experience of apparent things.

But it would also seem unproductive and unlikely for consciousness to have all this experience going on, without gaining anything from it.

Doesn't this envisage awareness as something "other", though, that has aims and purpose independent from the experience you are having right now? It paints awareness as **a being**, rather than just **being**. Awareness, though, isn't a thinking and doing thing - rather, it's what the experience of thinking and doing is "made from".

(Pondering:)

It is important, I think, to not imagine awareness as being what the world is made out of - in the sense of there being a 3-dimensional place and it's made from awareness, with us within that place. Even more abstract descriptive schemes often contain that hidden assumption. This isn't the case though. There is only subjective experiences. Awareness takes on the shape of experiences, not places. Bringing it right down to the immediate: The current "moment" of 3-dimensional experience right now is of apparently being "over here" with the screen "over there", but a brief pause to investigate reveals that "you" are actually "everywhere" in this "moment". And there's nothing else. Consciousness can't evolve, because it is "before" time. Time exists only as an experience. This means that evolution and being productive and having a purpose - none of that belongs to consciousness. You can experience having thoughts and feelings of those things, but that is content, not context. We can have experiences "as if" such things are true, but they are only ever relatively true. The only thing that is fundamentally true, is being-aware ("awareness", not of anything specific). Awareness has no meaning as such. Meaning only exists in the accumulated patterns, relative to one another. It is helpful, I think, to make a distinction between this fundamental aspect ("the truth") and what is meaningful in terms of "being patterned as a human experience". Meaning is to be found in our current state, and not in our recognition of the fundamental nature. That recognition merely gives us an insight into our true situation, and lifts the restrictions which only exists in our narratives about ourselves (including the metaphors me, you and Tom employ for the purposes of discussion).

...That's just a shifting of definitions, surely - because we lack decent words for this, "consciousness" having been used to mean all sorts of different things. Broadly speaking, people use it interchangeably for three different things:

- **"Consciousness-of"** - The experience of being conscious of content, as apparently separate objects.
- **"Self-consciousness"** - The experience of identifying oneself with a particular part of that content.
- **"Consciousness"** - The non-material "material" whose only inherent property is being-aware and is not an object or personal, otherwise known as "I AMness". It is "before" division, multiplicity, change, any structure.

The first two are best described as "patternings" or "states" of the the third. When I use the word "awareness", I mean that third definition. When you use the word "consciousness" in your example, you are referring to the first one, perhaps with a hint of the second. I use "awareness" for this, because the word typically has less connotations. Although it is lumbered with sometimes being used by people to mean "within one's attention", at least you can then suggest that if one ceased to focus one's attention at all, it would be without boundary or location, which is a reasonable metaphor all on its own. While awareness might taken on the shape of an experience of apparently thinking and doing, it does not actually think or do anything in and of itself. It becomes a state, it does not do anything (which would imply a subject and object relationship) fundamentally. It "takes on the shape of" other properties, but they are not inherent properties of consciousness. They are temporary, and there is nothing "behind" them, no persistent solid underlying substate supports them. They are "just" patterning, at the same level, non-hierarchical. So, for sure, awareness might get formatted into the experience of "being an evolving digital system", but no aspect of that will be the "fundamental elements of consciousness" (as per the definition), although they might be considered the building blocks of a metaphor describing a particular pattern of "consciousness-of". Broadly speaking, if we separate things into content (the relative transient truth of structuring) and context (the fundamental unchanging truth of the nature of experiencing) we can keep things straight, though, I say. Aside: We have to tread carefully here anyway. As soon as we talk about, for example, an "evolving, digital system", we should pay attention to how, exactly, we are imagining this - by which I mean, right now. Do we imagine it from a "view from nowhere"? Are we seeing little cellular automaton doing their stuff, as visual thoughts in our mental space? How, exactly, does this translate to something in reality?

If we are not thinking of something as a 1st-person experience, we must consider how that 3rd-person view makes sense. Does that "diagrammatic" view ever get experienced? And then in what sense does it ever "happen" or even exist? And so on. The implication is that, if we imagine something occurring in an "objective world", then we are "already wrong" in a way. Although all of that doesn't deny us the ability to create useful or interesting descriptions, it does mean that trying to be "right" with them is pointless. They are just more experiences, at the same level. "Awareness" or "I AMness" can be directly perceived or known, then - because you are it - but it can't be thought about. The conclusion here is that we must be clear about the purpose of our thinking, rather than just (as we all do now and again) hand-wavingly assume that we are investigating "the nature of reality" or whatever.

...There's a bit more to it than that, though. We need to take care to notice not just what we are thinking about, but how we are thinking about it. It's this one step back, "meta" approach, that indicates certain things to us. Awareness, as described, isn't something that is comprehended; it's not an object. "Awareness" is a conceptual object, sure, but it's intended to point at something which cannot be conceptualised at all. It is "isness". There is no concept that can be "behind" Awareness. It is the direct "I AMness" that you know intimately right now. I'd say it is something you experience, rather than think about, but even the word experience implies a sort of subject/object divide. You don't "comprehend" or "understand" it. This is where all that "the Tao that is spoken is not the true Tao" type stuff comes from. It is the context, because without being-aware, this is nothing else. And remember, there is no "outside" to this (and no "inside") so it is actually meaningless (in the proper sense of the word) to talk of a "beyond". It has no location, no boundaries, no edges, no extent.

...that could be far outside the borders of our imagination.

Your imagination (and your experience more generally) has no borders. Go looking for borders in your experience, right now. Don't think about borders or beyonds, because all you'll do is imagine borders or beyonds inside experience. You'll be thinking a concept, rather than actually looking for borders. Actually "feel out" in your experience, as it is. There's an inherent problem, which is: thoughts are already divided and even the thought about "undivided" is a divided thought, an object in mental space which only makes sense when related to other objects. It is not possible to think about a subject - it is immediately "too late". It's like trying to make a sandcastle which represents both "the beach" and "sand". The sandcastle, like every sandcastle, is both of those things, but it cannot capture those things. There is no sandcastle which could do so, simply due to the nature of sandcastles. All we can do, is point to the fact that what we are talking about is, "not this, not that" (while being all things and nothing). Build sandcastles, and then attempt to draw attention to that which the sandcastle is "of" rather than "about". The direct noticing of this, though, is super-simple, and actually the simplest thing there is (and of course it is). So, when we think about there being "fragments of consciousness" or whatever, we must pause, and actually look at the structure of the thought we are thinking here. Does it appear in your mind like a little diagram, for example? What, exactly, is the imagery? And how, exactly, is that imagery meaningful in terms of the context of that experience? "Reality" is this, right now, 1st-person, and that is what must always be included into any picture. The subject of any conceptual object must be part of the consideration. Content without context is fantasy (albeit perhaps a useful one, and there's an argument that your main strand of experience is a fantasy also, just that it is a 3D-immersive multisensory strand of thought).

(It'd be good to do this from the ground up really, but lacking time, so let's just to-and-fro for now.)

I'd shy away from calling it a "source" since that implies spatial and temporal aspects - but we have to be easy on ourselves here, since we can only talk around this, rather than capture it. So, I would be careful of the language perhaps, and give ourselves a pass!

Awareness "takes on the shape of" experiences, and so the context and the content are one, of course. Also, when you say "not-yet-conscious" what you surely mean is "not yet self-conscious" as in our earlier discussion - but it is inherently being, eternally. This "raw" state is a hypothetical state, though, because it is always in some "shape" or other. The reason to make the distinction between content and context in our description, is - as well as avoiding saying "all that is, is" - that it permits us to distinguish between what is always true and what is not. The reason why might choose to say that awareness is "outside" of content in a sense, is that it is not reliant upon it, it has no foundation. We're making a distinction based on property and persistence, rather than material construction. From this, we'd say that awareness doesn't evolve, because time is "within" it; it is not bound by time. Awareness is "eternal" (as distinct from "forever"). And all possible patterns and facts and experiences are also "eternal". There is no creation, "creation is already complete", only relative intensity of patterns changes, and even that doesn't not happen "in time". So, we might say that content evolves, because time is an aspect of that particular content - it would still be static from the point of view of awareness, though - but the property of being-aware never does. All content could dissolve right now, for no reason - reasons exist only relatively, as the structure of content, after all - but this context would remain.

To consider: When new molecules are formed, or when molecules are annihilated, do "atom" and "molecule" evolve?

And: If awareness and content are one, then what does this mean for your experience, this sensory moment, right now? (Again: if you start thinking about things in the 3rd-person to answer this, you will immediately be "wrong", surely.)

I can't bring myself to a solid conclusion about what awareness or consciousness is

There is no conclusion (in thought) to come to, about what awareness is - it simply is and can't directly known to be so, but it's in the manner of an insight, rather than a logical conclusion. It's a fact of this moment; one needs to switch to attending and intending, rather than thinking (which is just a deformation of your present moment really, rather than a revealing of it).

But one thing we should agree on is that humans are more aware than a bumblebee.

Human beings aren't aware at all. "Human being" is an experience that awareness can have. You are that awareness. The phrasing would go something like:

- "What you truly are is 'awareness', which is currently 'taking on the shape of' the experience of apparently being-a-world-from-the-perspective-of-a-person."

Now, we might be tempted to say that this experience is evolving, but actually I would say that it is not. It is static. What is apparently changing, is the sensory content, but from the perspective of an overall state, it is unchanging and deterministic unless shifted by intention. One might conceive of this as that there are all possible states, always present and active, but differing in their relative "brightness" at this moment (the eternal Now). The divisions we make between states, sensory moment, eternal patterns, and so on are essentially arbitrary though.

A couple of things, which are really the same thing:

- In my view, you must think about this from a 1st-person perspective, otherwise this is pointless fantasy. You must recognise that you are awareness, taking on the shape of this experience, meaning this shape of "moment". If you are thinking about it in an abstract, 3rd-person way, diagrammatic model kind of way rather than actually linking this to your current experience right now, then it doesn't lead anywhere, I would suggest...
- What is the purpose of this theorising?: We're basically just drawing pictures the mind, essentially in parallel to our main strand of experience. We never get to something "behind" that main strand, because: a) we are always working in parallel, at the same level, and: b) there is no behind. In what way do you think the two are connected?

My answer to that final question is: only by both being experiences in/as awareness. They are both made from "sensations, perceptions, and felt-knowing". One experience, the model, does not describe the other, the strand. Rather, the value of a model is that it may lead you to recognise something at a "meta" level: that thinking and perceiving are of the same nature. In effect, your main strand of experience is also a thought in and of awareness - albeit a 3D, unbounded, multi-sensory, particularly bright strand of thought. You are not in a world, you are having a thought of a world. All the time, as we consider this stuff, we must retain that "meta" step back and be aware of ourselves as context, notice what it is that is actually happening when we "think" or we "perceive": patterns in you-as-awareness. Otherwise we are getting lost in content and mistakenly consider experience to be something that can be "understood" or "solved"; it isn't.

EDIT: A question to ask yourself: do you feel that the world, or your experience of it in this current moment, is outside of you or inside of you? I don't mean what you think about this, I mean do you perceive that the current scene is inside of your perspective?

...Okay, so that's a nice description. It's seems fairly self consistent, it depicts a structured view that can be logically explored within its own terms; it's a coherent "castle". But -

- What is it a description of, exactly?

Pause for a moment, become aware of the room you are in, then think about your description. Then notice:

- Where is that description located within your experience?
- Where is the room located within your experience?
- How, exactly, are the two related?

Note: Don't think about those questions and construct an answer to them. Rather, directly observe the situation and report it - if you see what I mean.

...In all cases, though, I'd say you replied with explanations - referring to concepts - rather than your observations. I mean this much more simply: that you tell me what you are actually experiencing, rather than an interpretation using concepts (as far as possible).

- For the first question, I meant literally where in your experience is it - not a conceptual description.
- For the second, similarly.
- For the third, again, I mean literally, their actual observed relationship, rather than a description which you do not, in fact, perceive other than in the thinking of it.

Personally, I've never experienced a "being-level" or "being modified" or "experiences" being "generated" by "interactions". Do you see what I'm getting at? All that stuff falls within the first question, because once again we are engaged in "describing". With those answers, we are potentially answering all the questions in a way that obscured the answer to the first question, which would have made the answers to all the questions different.

...So we might say they're at the same level. One isn't "behind" the other one; they are both arising within the same "space" (using that term for convenience), "beside" or "parallel" with one another in that space (loosely). Now, to clarify things further - revisiting one and two: what are they "made from"? What is their nature? And do they differ? And if so, how do they differ? Again by observation, by directly attending to the experience of them, rather than theorising.

...And what is this "me", what is "me" made from? And where is "me"?

(Then we'll pick up those other bits.)

...Okay, so perhaps jumping ahead here (we can reel back if we've gone too far) -

So, although we use words like "consciousness" and "me" (or "awareness"), which objectify it for the purposes of discussion, it's really just isness or IAMness or "this/that" and so on. And "consciousness" and "me", being words or concepts, are also made from and within that, so we have to be careful to see them pointers to "nowhere-everywhere" - and not object-concepts which can be manipulated or used in models and descriptions. Now, remembering the "feeling out" exercise earlier in the thread, when we close our eyes and go looking, we find: that experience has no edges, no boundary, no outside; that "me" is not located anywhere, but is everywhere in that experience; that the present experience is entirely "made from" or "of" this "me".

So, looping back, we see that the relationship between the main strand of experience and our descriptions, the connection, is that they are essentially both experiences of the same nature. One is not "behind" the other, one does not "describe" the other; that idea is itself a concept. They are like parallel-simultaneous strands of sensory-formatted experience, like strands of thought, within you-as-awareness - although one of those strands is "unbounded" and "unlocated", making it the 1st-person strand which we end up identifying with as part of a "world". We conclude, then, that our experience of the world takes the form of sensations made from awareness, and there is nothing behind them at all - there is no outside, no levels, and no depth to our experiences. No world, as such. This is where I get that summary of: you-as-awareness "taking on the shape of" the apparent experience of being-a-world-from-the-perspective-of-a-person.

So -

- Descriptions don't matter. We are effectively directly imagining-that we are a person in a world, we are having experiences "as if" this is true, but it is only true as a moment-shape we have taken on, a thought we are having-being. Descriptions are just another experience.
- Descriptions don't matter - except in one way, which flips around the everyday notion of what a description or explanation is about. But first -

Pause now, close your eyes. Now, raise your arm. What was the nature of that experience? What do you actually experience? And: how did it come about? Again, from observation.

...Remember, though: observations only. Describe the experience itself, not any conceptualisations (which are another experience, as we have noted in the discussion above).

- Did you actually experience "interpretation of data" or "receiving from a system" or "being integrated"?
- Did you actually experience "utilising free will" or "reality reacting" or "the logic of a ruleset"?

Don't go beyond what is actually experienced.

...Okay, good. So, I'll suggest a couple of things and see if they fit your experience:

1. What constitutes this "1st person perspective" - when left uninterrupted - is the experience of being like an open space, with various sensations floating in it, phasing in and out. You do not actually experience being a body, as such; it's a scattered bunch of sensations, with a visual image floating in one direction, and sounds distributed around, and so on. Everything seems to be both "over there" and "here". If you place your attention on these words on this screen, and then decide to direct your attention to "the place you are looking out from", you'll find a sort of structureless void. If you follow this direction, it goes on forever, and in fact goes on in all directions. You cannot find a "person" anywhere in this experience - except when you summon the thought of a person: an idea or concept, which is itself an experience of course (of thinking about "a person").
2. When, as you just did, you deliberately make a change such as raising your arm - you cannot find the cause of that change. You only experience the "result". Even if you were to have the sense of "about to do this" or a thought of "I'm going to raise my arm", you'd have same problem: those would be results too, with no detectable cause, and they certainly didn't cause the arm-raising, since there is no overlap between them; they are one-experience-then-another. As you attend to this, you recognise that

there is no cause; the change is self-causing. You "know" you change it, but you cannot detect any mechanism or method or "doing" - only a shift in the content of experience. You eventually conclude it is as if you, as awareness, shape-shifted yourself into a different experience, simply by becoming it.

As usual, the wording makes this seem involved and complicated, when actually the direct observation or experience of it, is just that it is (with nothing "behind" it).

I do believe that this is a little picture way of looking at reality.

I would disagree with your points, somewhat inevitably. :-)
Let's see -

First, I'm not detaching the "awareness" part really, I am saying it is reality. Not integrated - is it. And you are that. More importantly, it's not "things just happen for no reason". It's true that things don't happen for an in-world reason, because all those reasons are, in fact, results. The reason for all of those, though, is the one reason: named "first cause" or "intention" or "direct imagination" "unbounded thinking-that" or "awareness shaping itself".

The second part is where it all leads, because (as promised earlier) it changes what a "description" is. A description is not an explanation or an understanding of an experience, it is its own pattern in parallel. However, if you intend an act in terms of a description, then you imply the extended pattern of that description in your experience. You are intending the description as well as the outcome. In other words, the use of descriptions causes us to have experiences corresponding to them; continued use of a description stabilises the patterning of our experience in accordance with the description. This is contrary to the usual view that descriptions are independent patterns which reflect a separate, structurally stable ongoing experience.

This has the fun side-effect that whatever worldview you are playing with, you will tend to experience encountering evidence which supports it. If you change your mind and commit to it, the evidence will change accordingly. If you are undecided, the world will seem messy. If you "go meta" and start experimenting with the idea that the "imagination room" metaphor is almost literally true, you will have super-flexible experiences which confirm for you that there is no "world" or "system" at all as such - at least, not one that can't be instantly dropped as just a strand of thinking. (The same applies to the other "Active Metaphors" listed in the sidebar.)

It does makes sense for awareness to evolve and grow within and along with its entire consciousness system.

That's just a story, though. You can have experiences "as if" that were true, for sure, but if your pursue this line of investigation you'll quite quickly realise that you can have experiences "as if" pretty much anything is true. This is because intention is the only cause, and if you intend a description into prominence - or more likely, intend and act which implies a description - you will tend to have experiences which correspond to that description. All narratives about "evolving and growing" and there being "systems" - definitely, you can live that. However, whenever you pause and stop thinking about it, stop implying it, you'll notice that, still, all you are actually experiencing is being "awareness" which has taken on the shape of an open space with sensations (both thoughts and perceptions) floating in it. You never get outside of that. Which is why some people use the "you are the dream dreaming itself, the content and the dreamer as one" metaphor (although I think that "dream" has a lot of associations which can get in the way really).

Note: I've tried to be clear, but this can be a hard point to get across: I'm not saying that "an open aware space in which sensations arise" is fundamental either. That too is just a shape awareness can take on. There is no inherent structure to you-as-awareness at all. The only fundamental, persistent truth is the dimensionless, locationless, eternal property of being-aware. Furthermore, as I tried to highlight previously, but it's worth emphasising: although I'm using the word "awareness", I'm not using the word in the usual sense of word-usage, and definitely not an object; the word doesn't point to anything at all, not even "everything". It's a placeholder for "not-nothing, not-something", the context that is also the content but isn't either, and so on. "The awareness that can be talked of is not the true awareness", you might say.

So. As a "way of looking at reality", then, this is not "a little picture" or indeed any other size of picture. Regarding "pictures", though, all pictures are arbitrary, and you can have experiences "as if" any picture is true. You may indeed be having experiences "as if" it makes sense for "awareness to evolve and grow within and along with its entire consciousness system", but that is just a relative experience; you've not got "behind" anything and it has nothing to do with the nature of experiencing itself, which is "reality". And, we should note, the "awareness" of that sentence is not the awareness I have been describing above, by that nature.

TL;DR: All that is ever "happening" is this 1st-person moment of experience. If we think about other things happening outside of that, if we pause we will notice that those thoughts are actually just happening within this 1st-person experience too. There is no outside cause to this 1st-person moment. The entire moment is you, and you are its only cause. You can have experiences "as if" outside things are happening, but closer inspection always reveals that it is only the 1st-person moment that is happening, with nothing solid "behind" it. Descriptions are best thought of as potential patterning rather than accounts of a stable persistent world-experience.

But even the experience of considering these concepts/ideas is just another pattern happening on the same level as all other patterns.

Indeed, the experience of considering these things, is itself an experience, with nothing "behind" it.

Patterns interacting with patterns, or rather: One big pattern interacting with itself.

Or actually: not interacting at all, because it is "before" time, and it is static between shifts (any apparent change due to the pattern of "time passing" is actually deterministic, fully defined in the state).

So what about this sensory pattern of human experience? This doesn't seem completely random and structureless to me...

Not random or structureless - a pattern. The pattern that corresponds to "apparently being a human being in a world".

they're having the experience of, and are having the experience of describing and conceptualizing.

The patterns aren't having an experience though. Rather, you-as-awareness has taken on the shape of a pattern. Awareness has - or really is - the experience.

Aside - Ultimately, we throw away even the "awareness" concept and just say that what we are is the experience that is happening. However, it is much easier to progress by "restating the observer" and withdrawing to that position gradually. Even afterwards, the notion of "awareness" is still useful for the purpose of discussion, but we recognise that it is empty, just a pointer to the fact that experiences are experienced - or better, simply: "there is experiencing". However, "awareness + patterns" is the minimum structured model that "makes sense" for formulating descriptions which can be used as intentions.

And the patterns can increase or decrease entropy (decrease randomness, organize, become structures, give birth to more structures).

Hmm, I don't think that any of those things happen. Again, you can have experiences "as if" they do, but fundamentally there is no time other than the experience of time. The "imagination room" provides a little story which allows you to conceive of your experiences as you-as-patterned-awareness, but of course even that is itself not fundamental. In fact, the idea of "fundamental" is probably finally better replaced by the notion of no-hierarchy. But I've drifted a little bit there.

if there ever was a "beginning", which is another can of worms

A can of worms, indeed!

There was no beginning, because there is no time other than the experiencing of it. Awareness or "the fact of experience" is eternal (as distinct from "being around forever"). It is "before" time. This does make things tricky, because the correct conclusion is that there is no evolution and no cause, although we can take on the shape of experiences which are "as if" there was evolution and cause.

Awareness at the early, primal stage of these patterns is barely aware, as there is barely any content to be aware of.

If we get rid of the idea of "primal stages" and just say that it is possible for awareness to be shaped such that it just is. You can produce that sort of experience yourself, in fact. This is a description which gets close to it.

Information/patterns originate awareness, eventually organizing into a "pattern of awareness" which evolves and grows along with the "patterns of experience/content", working together as a system.

I don't think you mean "awareness" here. Patterns cannot originate anything (what are the patterns "made from"?). Patterns are awareness / awareness takes on the shape of patterns / experiences are patterned awareness. Patterned awareness is like a "static landscape"; it is not something that "interacts" or "grows" or "works together as a system". It is more like a definition that fully defines a deterministic set of moments; a current state corresponding to a particular set of contours. The definition is not read or processes or whatever, though - it is simply experienced, directly. But none of that matters too much, really, if we are clear about the purpose of our model. Our model isn't no explain how things are, because how things are simply is your current experience, nothing more. Rather it is not provide a way of conceiving, in the 3rd-person, of another experience which we might adopt in the 1st-person. Our thoughts-about an experience are identical in nature to our experience-of an experience. Having formulated a pattern we desire in the 3rd-person (via the direct imagining of it) we then adopt that pattern as our experience in the 1st-person (via the direct imagining of it). There is no "method" or "technique" or "how it works" or "how things are" to this - one simply does this, becomes it.

...We have to be careful with questions such as "why?", because one sort of "why?" implies a purpose, and purpose would be a relative truth only. But, here, I guess you mean the other sort of "why?", as in "how come this experience not another?", and really we are reaching for the answer to the question: "how can we change this experience to one we desire?"

For that, we return to: because it is the shape we have taken on. That is, that your current patterned experience consists of the accumulation of intentions and their implications. And the way to change the experience is to "shape-shift" ourselves, by "intending" (increasing the intensity of contribution of one pattern, "the intention", versus the others) which amounts to "thinking it" - but not of it or about it, more like "thinking the fact this-pattern-is-true". Meanwhile, the reason I wouldn't say "what is happening" is evolving, is because I'd suggest it is static between intentions, between shifts. If we shift to a new state, than that new state can have apparent evolution fully and deterministically defined into it, simply because it has a "time" pattern. It's completely fine to have "evolving" as part of the narrative we adopt, and to have experiences "as if" it were true - we just have to be cautious of seeing it as fundamentally true, because it implies a process, and the basic situation is "before" time and processes.

Okay, with all that said, we've come to the conclusions which can be partially summarised as:

- Reality = "awareness" = you = this whole experience
- Change = intending = shape-shifting = becoming

Which basically amounts to: "this".

In terms of a model, though, we can think of ourselves as a "shape-shifting material which can take on the shape of any experience/situation", knowing of course that this is an enabling metaphor and that actual situation has no inherent qualities at all other than being-aware.

Practically speaking, though?

To make changes, it really involves a sort of "direct thinking" or "direct imagination", where we "imagine the fact that something is true or happening" and this is equivalent to becoming that experience. As we've discovered in our discussions, theorising about it is really the adoption of another sort of experience - to actually grasp the truth of the matter, one must attend to it directly, play with intending/shifting, and grasp it with a sort of direct insight rather than by understanding. That's why this subreddit tries to encourage people to try out a couple of "childish" exercises, and have the experiences which might lead to reconsidering one's nature and destroy the notion of something "behind" things. Actually those "childish" non-techniques are it, really, since experiences are it!

...

*Q1: I can have the experience of imagining a reality as though true.
i.e. 3rd person.
surely then it is simply a case of experiencing the imagining as though real - 1st person.
the trickiness comes from not getting caught up in the 3rd person and not accepting this reality as real*

I'd agree. If we say that a 3rd-person thought (a thought about something) is a bounded, located thought, then a 1st-person thought (the experience of something) would be an unbounded, unlocated thought - a patterning of the subject as a whole. One might experiment, for example, with thinking wordlessly the thought "relaxed body" until it became true. That would be an example of patterning the 1st-person experience with the pattern "relaxed body". The result would be a shift in the content of experience towards a state where the pattern "relaxed body" was relatively dominant, without having "done" it.

*Q1: yes
it's like wanting something - i feel a want in my 'body' until it comes true
i make it come true by either acting or it 'just happens', i suppose
where i am now is that i see something as real but i know it is not real so i want to experience something else - something qualitatively real in that it exists from a direct intention without me supposing that there is a subtle meaning
because anything that exists in regard to something else cannot be by itself true and must be an erroneous experience
and the only thing that i believe to be true is -
kṛṣṇakalā rādhā rādhākalā
i.e. my expansion radha then radha's expansion, this gopi, based on this. i use the thought-about a conversation between "key" and nam woo hyun with respect to me as a springboard to create a worldview.... :/*

You-as-person are "Maya" too. All experiential content is "Maya". That's why this search for the "real" will never come to fruition. It's a recognition you have that applies to all experiences - that all experiences are you-as-awareness taking on the shape of an experience - rather than an experience in and of itself. For example, look around now and see that what your present moment is made from, is "sensations, perceptions and thoughts" in awareness with nothing "behind" them. Reality = this experience, this moment which contains everything, that is all. Any thoughts-about those experiences are themselves experiences, at the same level.

Standing outside, one looks out upon the scene before them. Beyond the house, a garden. Beyond the garden, a hillside. Beyond the hillside, the evening sky. Beyond the sky - "awareness". And then it is recognised, it was all awareness.

then i just have to have the experience of my choosing as all experiences are fictive in nature and the experience of everyone else being stupid is valid too

And equally: all experiences are direct experiences of the fundamental nature of reality (including experiences of apparently stupid people).

so in order to get a scenario that i want, wouldn't i just have to create the 'script' in-thought and then see it play out

You have to be careful of abstracting this, though; it's a matter of "direct imagination" or "direct thinking". By which I mean, you should consider this as a literal intensification of a pattern or fact or scene within your current "3D thought of being a person in a world.

So - and I know you'd didn't mean this, but it's a good example - you probably don't imagine writing a script, because you would then have experiences of seeing scripts being written (or elements of the extended imagery of that). It's possible to do it like this so long as you do so knowing-that it is a direct interaction with the world, but mostly I think people end up just having a parallel fantasy with isn't attached to the main strand of experience. Typically, then, what you do is, you intensify a desired "scene" (or "knowing of fact") as if it were actually happening (or true now) - and by doing so the fact of that scene happening is incorporated into your "3D world-thought". This doesn't necessarily mean you actually have to see and hear the scene; it's a sort of maximised felt-knowing of the pattern more than anything, from which visual imagery may or may not arise, as a side effect.

The word "incorporated" is important, I'd say: you should generally take the approach of intensifying into fact the desired final outcome, rather than any particular path towards it. Your strand of experience is already heavily patterned, and it will be naturally overlaid. If you focus on the means by which an outcome will arise, you often end up generating the experience of the means as your outcome, rather than the experience of the end. Of course, if you are feeling particularly adventurous you could aim to create

a full discontinuity, without any apparent paths, jumping straight to the "scene" and having the world implied by the scene from that moment onwards, but that's something for you to choose to experiment with or not.

i had thought about that - like condensing my entire 'experience' of the 'the world' into one thought and then creating a new thought

Yes. And I'd say that this is the situation right now: the entire world is this moment, a single thought, static and fully deterministic between intentional shifts, and "time passing" is itself a static pattern as part of that thought's overall patterned state. A thought of a world. We tend to assume that our experience is just the "unfolded" visual, auditory, textural aspects, but actually we are experiencing the entire world in this moment, it's just that the "felt global summary definition" is a sort of background, dimmed, dissolved feeling, rather than chunked up into bright objects. It's all active now, though - as one single pattern. If this wasn't the case, there would be no meaning to the moment. (Simple illustration: when you see a car, you don't see a shape, you see "a car", and in fact a particular "car". The car is that felt-meaning rather than just the unfolded sensory aspects.)

So: if we summon a single 3D multi-sensory image, and that image has felt-meaning, then it actually contains a whole world implied within it. This could correspond to a revised version of this current world, or a completely new one. Pausing now, closing your eyes, imagine a man walking along a road. Don't draw the man and the road, just imagine-that there is a man walking on a road. A world has been created by this act, albeit not an immersive 1st-person one. Allow the scene to continue unfold without interference. Where does the man go? What do you find out about him? And so on. One might then ponder: what if I stepped into this world by allowing the scene to surround me? Or, what if I adopted the 1st-person viewpoint of the man?

(Not checked out Rupert Spira's activities for a while; thanks for the reminder link.)

one might ponder that...but that would be a ponderance ;)

Heh, a ponderance it would be, indeed! :-)

things only seem to change when i do something

Which is fine, an (apparent) mental or physical act which has an assigned meaning which is the outcome, is a perfectly legitimate (by which I mean an "unfolded" experience as the apparent act). The act itself is also a result, but having assigned causality to the experience of the act, the result is part of its pattern (the Two Glasses exercise uses this approach). The act doesn't need to be sensory - it can be simply an act of "knowing you are shifting" with no content in the moment at all - but I'd agree that it is generally helpful to have a sensory aspect or imagining that counts as the "theatre" of making a change.

the car is the subject and i am the object (of experience) but both are me

Actually, it's probably better to say that you are the subject and the car is the object - you can't find your edges, but you can find the edges of the (sensory aspect) of the car. But yes, it's all you anyway, so with that known the distinction doesn't matter.

since i just want one particular experience, i'll focus on that.

Good. Both from a desired outcome point of view, and also in terms of conducting an experiment and explore experiencing, that's good. You don't need a clear (visual) image; you just need a clear "knowing". Since we're talking about "direct imagination" or "direct thinking" here, the path doesn't really matter - just as if we draw a picture on a metaphorical flexible television screen, it doesn't matter what the story was that was being shown onscreen prior to it. We simply assert the new picture, and either that becomes the new starting point (extreme discontinuous case), or it becomes dissolved into the current programme and incorporated into it.

...By "knowing" I mean more that, for example, you "know" a fact even though you are not experiencing any sensory aspect of it, physically or mentally - sort of "objectless thinking". Not sure "order" or "timing" is necessary as such; but if you mean "fully summoning a scene as a fact" then, yes, that's definitely a possible approach, in the spirit of this "direct asserting" we've been talking about. Pursue that and see where it leads?

ultimately wouldn't all I have to do is to believe in something

What's a "belief", though? I'm not a fan of the term; its meaning it not clear. Ultimately, what you want to do is "think it until it is true", which is different than (as some people consider belief to be) "thinking that something is true".

Q1: *Ultimately, what you want to do is "think it until it is true"*
the problem I have is I constantly think it isn't true. so by believe I guess I mean I think that it is true and it will occur because I believe in it

Well, you really need to give up that bad habit, then! :-) Perhaps you could work on the meta-fact of "thinking things makes them true". That would capture the essence of it, the desired formatting of your experience, both in the form of a "belief" and the form of a "world-fact".

...In all of those, though, you are assuming you and other as separate, but this is not the case.

What you are is the aware thing that "takes on the shape of" this sensory moment, of apparently being "over here" and these words being "over there" - but a short pause, close your eyes, feeling out to try to find yourself, you find that you are "nowhere-everywhere".

What is real is: *The current experience, specifically you-as-the-experience.*

When you think about theories in attempt to describe reality, the experience of thinking the theories is true, but the theories themselves are not real (in the sense that the ideas don't correspond to anything "behind" experience; there is no "behind"). So, based on that perspective, let's try some quick snappy answers to those statements:

what is reality?

It is you-as-awareness having adopted the shape of whatever the current experience is.

what is true?

Only the fact of being-aware is unchangingly, fundamentally true. Everything else is relatively, temporarily, true only, for as long as it is the current experience.

what is real?

If we define real as "that which is always true", then the only thing that is truly real is the property of being-aware.

what is observed by me?

Being cute about this: yourself, as whatever the current experience is. You don't actually observe anything, rather you take on the shape of the experience of apparently observing something.

everything i see and feel is as a result of my environment

No, everything you see and feel is the result of you taking on the shape of experiencing "seeing" and "feeling". The environment is an experience you have adopted; meanwhile, "the environment" is a concept which does not represent anything outside of that.

i act and do things within my environment

You shape yourself into the experience of apparently being a body acting within an environment.

i sense things accordingly and act accordingly

You don't sense things, you take on the shape of the experience "sensing things", and then take on the shape of the experience of "taking action".

when did that occur?

Since time itself is part of an experience, and not inherently part of you-as-awareness, it never occurred in time. It is eternal (rather than "forever"). It is actually meaningless to talk of things occurring in time at a fundamental level. The "moment" you have currently taken on the shape of might have an apparent time aspect, or history, but that could shift right now leaving no trace, to a different "moment" with a different apparent history.

do I observe myself taking shape or am I actually the shape?

You are actually taking the shape. There is no "outside" to you, for you to observe yourself taking shape. I say that you take on the shape of an experience, to make it clear that you are not actually "over here" as a true external observer - rather, you are the whole experience, taking on the shape of apparently being "over here" and other stuff being "over there". As mentioned previously, if you close your eyes and pause and search for a moment - rather than thinking about this - you'll quickly discover that you are in fact everywhere and everything (which is also to so, no particular place and no particular thing).

so there is no difference between "me" and the ("my") environment

Right. There is no difference between "you" and "the environment". It is all you. To make the distinction clear, we sometimes say you-as-awareness (meaning the whole experience) and you-as-person or you-as-perspective (meaning that experience of apparently being "here").

then I can shape myself into the experience of apparently being a body who directly alters his environment
so no action really occurs beyond my belief in it - i.e. I only apparently act but I can also act without acting - receive the results of karma (action) without doing the work (कर्म कर्म कर्म karma karoti - doing action)

I'd say that no action (or experience of an apparent action) occurs beyond your adoption of it as part of your current state or "shape", which is itself an accumulation of intentions and their implications. That - intentions-implications - could be interpreted as corresponding to the concept of "karma".

but things can also happen without my direct performance of an action-with-desired-outcomes - i.e. intention

Ultimately, you "think it" in the sense of "thinking that it is true" or "asserting it", and that's what increases its "brightness" or "truth". You are doing this anyway: if you perform a physical act with an outcome attached to it, then the physical act itself came from nowhere. The act was a "result" just as much as the outcome was; it was all one pattern, brought into experience. For example, if you pause now and think of a red car, the red car appears. How do you do that? Note that, even if you thought the words "red car" beforehand, that wasn't the cause, that too was a result, and so the question then becomes how did you think the words? Truly, you simply "became" them, or you might say you reshaped yourself such that those patterns, that experience, was brought into prominence.

performing an action thus sounds like duality in this context (because i would still like to do some actions but the result is not in any way directly derived from the action)

Not a duality, though, if you ponder it a little more. An action is an experience, you are experience, you are simply shape-shifting, causelessly. If the action and the outcome are not logically related in-world, that is okay - you simply adopt the notion that "this action" means-that "this outcome" happens, and that overall pattern is what is intended/asserted.

this is my stumbling block! i keep having competing thoughts - "there will be no red car" - and thus nothing changes :P

You really should give that up! ;-) So, you simply have to be more fully assertive. It's completely under your control, it is all you after all. You don't fight those competing thoughts, just as when you walk through a door in a room you don't spend time trying to fight the fact that you can see other doors. You simply purposefully attend to the door you want to go through, withdrawing yourself from, forgetting, the other doors.

POST: The 2 CUP method

If you just specify that a particular outcome will occur - e.g. that a particular sensory scene will happen which implies the circumstances you desire - then, in the basic "patterning" model of experience, the path will just be whatever is the most efficient between the two moments of truth, given your current patterning (which you might think of as the "list of facts" that are currently in play). By moments of truth, I mean: this moment, which is being observed now and so is definitely true, and that moment, which you have just fully asserted and so is now substantially true. All moments in between were less well-defined, less fully asserted, and so prone to shifting to accommodate other assertions. Note that "most efficient" doesn't mean that the path is calculated; it is more like having two sticks connected by a loose elastic piece of string. If you plant the sticks at two specific locations on a landscape, the path of the piece of string will naturally fall and follow the contours of the landscape. And so...

If you wanted to more completely control the path between this moment and that moment (now and your outcome moment; the two sticks), you might consider introducing additional sticks which define some of the moments between now and then. This needn't be done separately - it could also be done by including aspects which imply a particular path in your outcome definition. For example, if you want a nice car but you want to receive it because your husband or wife bought it for you as a gift, you could include that in the "getting the car" moment. Generally, though, you have get comfortable with the fact that you can never "pre-know" everything that is going to happen - by which I mean, "unpack into the senses" in advance as a form of "pre-experiencing". Your life unfolding is that, really: the gradual unpacking of a pre-existing background patterned landscape. What "jumping" allows you to do, though, is assert the inclusion of certain points in that landscape, so that they are definitely incorporated. If someone feels the urge to over-specify, it's worth asking themselves why. Just by recognising it's possible to specify something at all, you are already in a better position than you would otherwise be. If you want to "pre-experience" your life, then you're basically saying you only want to live life after you've already lived it. Which is essentially death.

Aside - On the "dimensional inertia" concept and your mind "accepting" some things, it's worth remembering that patterning - and therefore "jumping" - doesn't just apply to the the events you are going to encounter, it also applies to the facts of the world more generally, and to your own sense of how things work. In other words, it is possible to work upon what feels acceptable, to work on the "how things work" itself - you can get very meta with this.

The intermediary steps follow from the assertion of the target moment + the truth of the current moment. So, they exist as a deterministic sequence between shifts. They become known when you experience them, in "unfolded" form, as you pass from this moment to that moment* - although you are always experiencing them in "enfolded" form really.

What, exactly, does it mean, to "assume" something? I suggest: it is a form of experiencing it, "then" as now, or rather "defining" or "asserting" it. It all reduces to basically "intensifying this pattern rather than that pattern".

Q1: *It all reduces to basically "intensifying this pattern rather than that pattern". yes that's right exactly. minimizing and eliminating ("forgetting") other patterns.*

Right. There's no good way to describe it, because in describing it we immediately imply the thing that is meant to be fading - but, yes, it's fully switching to one pattern and "forgetting" (or "forgiving" really) all else.

If you want to "see something" then you just imagine-that it is present and use that as the basis for things. There's no difference in kind of the experience you have with mushrooms and without. "Consuming mushrooms and having an experience" could be considered a pattern like any other. Once you can leverage, certainly, but you could work on establishing alternative, more direct, patterns if you felt so inclined. Pure randomness is a concept, not a thing you ever perceive. The world-as-it-is doesn't have "pure randomness" in it; that is a parallel narrative. If what you are looking for is a causal connection between intention and experience, though, then repeated experimentation that pushes things to the limit is the way to demonstrate that. There's not much point in focusing on individual coincidences.

..."Prove" in what way? Of course, there is no place for "evidence" to be stored, but after observing a connection between the patterning of thought and the patterning of experience - and directly noticing they arise in the same space - then you're done. That's all you need. To prove it, you do it. There's no record that can be kept. By a more direct pattern (versus mushrooms), I mean that mushrooms themselves are just an experiential pattern with no cause "behind" them. You could perhaps directly assert a

pattern to accomplish the same thing, with some dedication.

...The descriptive issue you're having is perhaps that, since the entirety of experience is "made from" you, you can never find the cause, because the cause is the whole thing, shifting. You will never find the cause within experience, because experience is self-caused - a shifting of shape. All you can do is note the intentions you make, and later recognise them appear as sensory moments. You can't manifest anything into "reality", because that implies a separation. The whole thing is "reality". Reality = experience = awareness = you. Right? Everything you experience, then, is a result, a result of intention, and since intending is just a shifting of experience, you never actually experience intending as such. So you only ever experience results, you never experience a cause. Cause and effect exist only as concepts. All there actually is, is taking on the shape of results.

If there's no difference from 10 years ago and today, then you should set up a business selling beauty products! ;-)

Well, of course, in the sense that you=awareness, your "true face" is completely unchanged in 10 years, or indeed eternity. Why didn't I think of it his before! The perfect business opportunity! :-)

As to the "why" question: it occurs to me that since there is no specific "how things are" or "how things work", then there is no particular answer to that question.

...

Q2: Hmm, so in this maner that would mean that "winning lottery" would eventually happen, on road ahead , even tho it could be after like 50 years or so. By this i mean, if i have made that kind of choice i have set "path" to it and it would eventually happen wright ?
And if we take in mind i chose to be "more lucky" it would eventually leading to winning of some sorts. Wouldnt it create like some sort of paradox in that way ?

What would the paradox be?

Q2: Damm you short term memory. Its a bit , but i will do my best to express my thoughts in English. If its impossible to understand please fell free to say that. Will try to explain. So let`s say i Wish for enormous success, so universe would start to turn things in a way i would achieve it. And in a same moment i would chose to win this jackpot, which also would be enormous success, giving chances that wining is slimmer than hair. So this would lead to success anyway, with 50/50 chance either building for example empire and gaining these (example: 20mil) or wining them after 20-30 years. Or getting both. In other words, if i wish and arrange universe for same outcomes with different paths would it make me land in completely different paradox , for example somewhere in middle ?

Oh, I see. Okay, let's go with this description: The "world" is a single continuous pattern, and by being single and continuous, it must always be "coherent" - that is, it will always "make sense". Right now, the world is in a particular "state", which means a particular collection of patterns are dominant. You might imagine this as being a landscape, with the contours being the current state. Your ongoing experience is like your attention gradually scanning across that landscape - like a landscape of "moments" defined by the current patterns which are active. Now, in addition to this we'll have the rule that:

- Experience is apparently local; intention is actively global.

Which means that although your attention may be on this particular moment of the landscape, if you intend something the intended pattern will apply to the entire landscape - it will shift to a new state, incorporating your pattern, and your experiences will be aligned with that new state from that point onwards, in a pre-determined way.

Returning to your point: If you wish for "enormous success" then that is a general pattern which is applied across the whole "world pattern"; the landscape is shifted right then such that subsequent moments will tend to have more of a "success" component. It becomes true now that you will have success then. Later, if you wish to "win the jackpot", then that pattern is applied across the whole "world pattern"; the landscape (which has already been shaped by the "enormous success" intention) is now shifted to incorporate "win the jackpot" also.

What is happening is, your world (this state, or landscape, or "world pattern") corresponds to the accumulation of intentions and their implications. Between shifts, the world is deterministic - the events you encounter are defined until you perform another shift. Every time you intend an outcome or a trend, the world shifts to a new state which incorporates that pattern, and a new deterministic path. If you intend something that is contrary to a previous intention, then the world is shifted such that the original intention is diminished. Avoid doing that, and it will remain.

So there is no paradox. The path of experience is never pointing in two different directions at once, just as a mountain in a landscape doesn't have two different shapes at once.

POST: I did the 2 glass method. Somebody explain why nothing happened.

The idea, really, is that you are the one who comes up with the theories (while keeping in mind the context of this, as described in the sidebar). But if nothing happened, then nothing happened - that's the result you got. If you want other people to chime in, though, then I guess you will "only" have to put a bit more effort into describing your target and process.

Q1: you are the one who comes up with the theories
but they're not, are they? they can't originate any theories since i create the possibilities of theories so all they are doing is selecting that which i have already created.... and even that selection is limited to what i want to see in others

From the perspective of OP, they are selecting them from what already exists, but everything already exists and was never created, by you or anyone else. From the perspective of you, now, then the experience of them apparently selecting, is a selection you are making (or have implied).

Q1: everything already exists and was never created, by you or anyone else
that's mayavadi philosophy that places Brahman ("infinite grid"), 'impersonal feature' as the highest existence
but I create that

How you gonna create that, begin that, when there is no time?

i create time - time is the means by which events occur but time doesn't exist any more than reality exists

Time is part of an experience. So, time would be part of the experiencing of an apparent infinite grid, but the infinite grid itself wouldn't exist "in" time; it exists as a potential experiential pattern, but not something that is "created" as an object. You might have the experience of apparent creation, but the object that is apparently being created already exists eternally as a pattern.

Q1: the infinite grid...exists as a potential experiential pattern
where?

Everywhere and nowhere. That's the eternal for ya! :-)

so you have no evidence that 'the infinite grid' exists :P

:~)

What do you mean by "exists", though?

If what you mean by "exists" is that exists "outside" of experience somewhere, other than as a pattern within it, then that is a meaningless statement: experience has no "outside". What I mean by exists is: one can have sensory experiences "as if" there is such a thing as the infinite grid. Can you have thoughts consistent with it? Then it exists as a thought. Can you have sensory experiences consistent with it? Then it exists as an experience. Thoughts and sensory experiences are both, in fact, experiences "made

from" awareness. And in fact, the difference between a thought about something and an experience of something, is just the intensity, stability and perspective (1st vs 3rd person) of the experience. If you have thought about something, then at that moment you know that it exists. You cannot think about anything that does not exist. Because, essentially, the concept of existence makes no sense outside of that category.

How do you know that "existence" exists? Do you have any proof? :-p

Q1: *one can have sensory experiences "as if" there is such a thing as the infinite grid. but how can you prove that I did not create that concept?*

Did you experience creating that concept? What exactly do you mean by "create"?

[did you experience creating] what difference would that make?

You are claiming to have created something. If you have never experienced creating it, then I'm unsure of what leads you to make the claim.

if i cease to exist - so does every other possibility of experience

How are you going to cease to exist? You are not an object, you are not content - you are subject, and context. If you never began, how can you end?

Have you experienced creation? How did you create something which, prior to that moment, did not exists and therefore could not be conceived of? The moment you conceived of it, experienced it as a thought, it already existed. The infinite grid is not superior to you-as-context, because it is that context, as are all and any other patterns. There are no levels here; there is no hierarchy. You exist and you are the existence of everything else. Being a subject doesn't mean that you don't exist, but it does mean you don't exist as an object, with a beginning and an end. You need to define "prove" really, but it is simple to demonstrate to yourself that you are the subject and the context, either by observing that you experiential content changes, demonstrating that you can produce experiences which show there is fixed content, or by simply attending to your direct experience: no edges, no location for "you", everything is made from "you". When you refer to your body having a form, surely you mean that you-as-experiencer has no particular form, other than being-aware, which is eternal?

i just want it

Want what, though? If by wanting you mean "thought of it", then did it not already exist?

so... 'the infinite grid' is a magical thing that has no creator and no cause and exists for the benefit of every being in existence?

As indeed does every pattern. It doesn't need a creator because it was never created - it is eternal - and it exists as the basis of a potential experience within and as awareness. I'm not sure I'd say "every being in existence", because being is not something that is "in existence" and there aren't many or even one being. But I suspect you are using the term in a common language way, so that's fine.

sure there is - me at the top, everyone else below me

Top... of what? What structure could there be, that you are on top of? Now, you might have experiences "as if" you were some sort of thing that was on the top of some sort of structure, but that thing and that structure would just all be patterns, at the same level, within awareness. No hierarchy fundamentally, only an apparent hierarchy relatively.

what content is fixed?

No content is fixed. I think I missed with the "no" - oops! :-)

i do have a form... otherwise i wouldn't have experiences - even if that form changes, the form is itself eternal

No. You don't have any inherent form at all; you "take on the form of experiences. Experiences == form. That is why it is actually better to say that you become experiences rather than have experiences. Again, you are not an object, so you can't think of yourself as a "thing". Only objects have form; subjects do not (inherently).

but when did it first exist?

There is no first, because that implies time as a container within which things are placed, at a fundamental level - but you are the only "container" (albeit without boundaries, and that doesn't just mean no "spatial" edges).

what is eternal? only i am eternal

You are eternal, but you are also potential for everything.

no form means no experience

No inherent form means all experiences are possible. Any particular form would be only one experience would be possible. You have no inherent form, but you are that which "takes on" forms (=experiences).

Q1: *that implies time as a container within which things are placed yes - brahman - 'infinite grid'*

It's just one pattern of many (any!), though. You could equally have "infinite gloop" as a pattern, and have experiences consistent with that. The "infinite grid" is not a container in the sense of truly being a place where things are located, which is travelled; it is more like a "formatting" around which experiential content can be structured (and is itself content).

and it has no cause, is superior to everything and everyone, cannot be seen, cannot be defined and is the prime cause of everything including me... sorry, not buying it! ;)

Heh. :-) Except for it being the cause of you, perhaps, unless you mean "you", of course.

there are two 'me's?

Quoted indicates a reference to the concept of "you", unquoted indicates that-which-is-aware.

the concept is me
a part of me
but there is only one me

Yes. So in one sense it is not you (because it is just a pattern within you) but in another sense it is (since it is "made from" you). Realising the nature of things is about recognising the difference, or even that there is a difference. There is not even one you, though, because what you fundamentally are is "before" division and multiplicity (although you can "take on the shape of" an experience of apparent division). That's why we say that you are "awareness", rather than "**an** awareness" or "**the** awareness".

Q1: *There is not even one you, though, because what you fundamentally are is "before" division and multiplicity isn't that just me? कृष्ण kṛṣṇa*

Me or "me"? :-) Yes, awareness = you = experiencing = . . .

Eventually, we just end up talking round in circles, because we're just using different words to point outside of descriptions, to "this / that". (Which, of course, is me doing the exact same thing yet again!)

...

Even then, I suppose we'd still have the problem of: what, precisely, is a placebo and how, exactly, does it work? (Just defining the term or categorising something as it, doesn't necessarily tell us anything about it.)

POST: Can keeping a journal help in Dimension Jumping?

Yes, it's a good thing to experiment with. Basically, by fully getting into a particular description while writing it, you are "patterning" yourself with it, just as with the owl exercise, with yourself as an "imagination space". People do this accidentally quite a lot. For example, they write a list of goals, then put it in a drawer and forget about it. A year later, they rediscover the list, and find all those things happened, even the unlikely ones in some way, although they didn't try to bring them about. And people who write fiction, who get really absorbed in the worlds and characters they create, can find that those situational patterns then turn up in everyday life.

...You could spend time writing about the grid, detailing how your experiences fit into it, and writing up a 1st-person experience of accessing childhood situations again. Really get into the 'feel' of it all. Then, sometimes, in a relaxed state, recall that and try to enact it.

...By "physically experience" do you really mean "1st person experience"? It just takes practice. You essentially dream your way into it, but it's as vivid as your present moment right now. See: lucid dreaming (Robert Waggoner's book is good), OBE (Don DeGracia's guide is decent), and also Neville Goddard for examples. In the end, it's all an imagining-that.

...You will have 1st-person immersive experiences! Before that, though, you will probably have sort of intermediate, detached experiences, as you get better at sort of surrendering and selecting. As referenced above, I'd pick up this book [*Lucid Dreaming: Gateway to the Inner Self by Robert Waggoner*] and read this free guide [http://www.dondeg.com/metaphysics/do_obo.pdf]. Now, I don't necessarily agree with the interpretations of those, but the first one will get you into the topic (it's definitely the best non-basic book on lucid dreaming), and the second one has some useful exercises and perspectives (the "sparkles" technique is basically what you want to do).

POST: 2 glasses to make someone else's life better - selfish?

If im not wrong (George might correct me), you are not jumping to another universe, you are just changing your experience "as if", so you might change few facts in order to release her from cancer.

Agreed. As the sidebar hints also, you are shifting your experience, you are not going anywhere or leaving anything behind (because in fact, you strictly speaking aren't anywhere in the first place).

...What you describe seems much the same thing, though?

I perceive it differently.

Do you perceive it differently or are you thinking about it differently? There's a difference between those that's worth noting. The actual experience is of the content of your experience changing discontinuously. That is what "happens". Whether a change in experience is minor or major - whether a minor opportunity arises or a major world fact changes - it's still a shift in the content. Beyond that, we are talking about how to conceive of that change. "Reality" and "universe" are just concepts, we never actually experience a "reality" as such. Furthermore, we never actually experience "moving between realities" as such. What we do experience, is that things are apparently different now, compared with our knowledge of how they were previously.

So I would also say that it would be selfish because in the other timeline, she would still die of cancer

That notion of a "timeline" might be problematic, however. Where is that timeline? Have you ever experienced a "timeline" other than the thought of it, or the seeing of a diagram depicting the concept of a timeline? What leads you to think of there being timelines or other experiences that are "happening" elsewhere while your experience is happening?

you just chose to live in a timeline where she does not.

I'd be inclined to say that you chose to have a different experience. The conclusion that she is dying of cancer in some other place while you are here and she is well, is something that comes from your conceptual framework and not any actual experience you are having. The key to me saying: *you are shifting your experience, you are not going anywhere or leaving anything behind* is that it is an invitation to reconsider the what it means to talk about "me" and "shifting", and particularly "what are 'you'?" and "what is 'the world'?". Without answers to those questions - or at least a recognition that they are maybe problematic - our descriptions are always going to be a bit lacking. None of this necessarily the possibility of making changes, of course. However, it does affect how we describe this, and therefore how we might think about potential "moral issues" such as the one you've highlighted.

...Yes, I do realise that you don't mean a change over time. My issue with "timelines" is that it implies that we are "going somewhere" - to a "place" where the history was different. This in turn implies that events have to have "happened" in order to use to be in a particular state. This is not true. As you note, you can simply lie down and shift your experience so that subsequently it unfolds "as if" a different history informed it. "History" is an idea, though; what your actual experience is, is of an ongoing Now which contains all pertinent facts or patterns, now. It's not really problematic in a deep way, of course. After all, experience is king, descriptions are secondary. I just think it's important to recognise that all descriptions are "parallel" and arbitrary. Descriptions are themselves experiences - experiences of thinking - and are not "what is happening". Recognising this, our descriptions stop being limitations because we don't take them as "the truth". So, when people seem to be "naysayers" because they seem opposed to the idea that timelines and universes are the explanation or the basis for change, it's not that they are dismissing the possibility of change "as if" there are such things, or questioning the usefulness of those concepts. Rather, they are just pointing out that it makes no sense to talk of a description as "literally" happening. Descriptions are not deeply true.

Which arguably can still function in your experience shift description that you have been describing.

Ultimately, all experiences can be incorporated into the "meta" view, since they are not tethered by any descriptions (including the "experiences shifts" description). However...

The way I am thinking of it, the only "problematic" is the idea that "opportunities will arise that are themed to your efforts for change".

...I'd restate this as: "your state shifts and experiences arise according to your intentions and their implications and embedded assumptions". In that way we capture both the "opportunities arise over time" experience and the "I go to sleep and awake to discover facts have changed" experience.

POST: a different D.J.

Could you maybe highlight some examples, for illustration? And also maybe describe the difference, in terms of your own thoughts, between:

altered states of consciousness to enter an alternate reality, most likely with subtle differences.

and:

magical thinking and willing the universe to give things to you.

I'm inclined to think that both descriptions largely point to the same thing, but using difference conceptual frameworks. And part of the ongoing conversation in this subreddit has always been (in "this dimension" anyway, as we say) about the different ways one can describe one's experience, and how those descriptions can be leveraged. I think threads where people go into a bit more depth have usually tended to bring up quite a few different models or interpretations. That is, while the idea of experiencing change

is a constant - the idea of bringing about some sort of shift in the lived facts - the ways that people are talking about it vary. Depending on who is participating at the time, different ideas are probably more prominent for brief periods. If you've only been subscribed for a month, that may seem more so.

Because every thread on this subreddit is full of people trying to naysay.

What are people "naysaying"?

sow doubt and explain why the other person is merely remembering things wrong.

Yeah, the "remembering it wrong" thing is usually something that happens in /r/MandelaEffect, not here. It doesn't add to the discussion here, and rather misses the point, so I'd encourage people to downvote it for not contributing, or report if it gets out of hand. I really don't think it's very prevalent on this subreddit though?

Please dismiss them.

But if he's remembering a different chain of events than you, and you're reasonably from this universe or a similar one, isn't it possible he's right?

The point is that the idea of someone having been in another "universe" and having moved to this "universe" is one particular model, and perhaps not the best one. It's problematic in that it is still based on some default assumption about our everyday experience, and the nature of "me" and "the world". What literally happened was that someone was having an ongoing experience "as if" one set of facts were true, and then suddenly they were having an ongoing experience "as if" another set of facts were true. Anything beyond that is conceptualising. The recognition that a description is a "parallel construction in thought" and does not actually touch the experience-as-it-is is an important one, and is ultimately what frees us up from hidden assumptions.

Note that I'm not using the phrase "as if" dismissively, I'm just highlighting that at no time does one actually experience an external independent "world" or "universe" at all. The only thing that is ever "happening" is: "experiencing". One infers that one has jumped worlds because of the assumption a "world" is a place, rather than an idea - and because of the assumption that "you" are a person, an object in a location, rather than an idea. Your actual experience of "you" is somewhat different than being an object.

It is worth attending to your experience as it is, directly rather than thinking about it, to observe its immediate properties. Extract from a previous comment:

Finally, a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the facts of your experience - the only actual facts, really; everything else is transitory.

...

AI: I agree, the sub has gone a bit off of the primary methods. But I believe there is a reason for this. The primary metaphors (mirror method / two cups) have some problems. These are not problems that are inherent with the method itself, but with the way the idea of 'dimensional jumping' relates to science fiction and pop culture. The result is people have a bunch of misconceptions and fears that are unfounded. This resulted in questions such as: What happens to the me in the dimension I leave behind? What if I get stuck in a dimension I don't want? etc. Typically to respond to these sorts of worries we have to explain that the techniques are only tools and aren't needed. Once people have an understanding of that, they tend to start exploring other techniques. This is somewhat unfortunate since the techniques are pretty solid, and the metaphor of 'dimensional jumping' is a very useful one. But ultimately it is all the same thing.

Well put, to the point. We're bumping against the limits of those metaphors, basically. So long as we don't confuse the metaphor with "the actual mechanism", this isn't a problem, but naturally when people first get into the topic, that can happen. This is a good thing overall: it provides a way into questioning our assumptions and starting a personal investigation into "the nature of experiencing", rather than simply accepting a worldview at face value.

When the current sidebar was written, it was meant to reframe things to anticipate that. If people last visited when the subreddit was basically the mirror method and not much more, then it probably seems like quite a change. In truth, though, it's just a recognition of how things were all along: there's an actual experience, and there's one or more parallel narratives about that experience. What's most interesting, though, is how a model might be used as a way to structure experience rather than just describe it.

I fall into the latter camp of scifi paranoid dweebs.

Those are the best sort of dweebs! :-)

As a recent arrival, then, probably something to note is that on this subreddit the main conversations generally happen in the comments, rather in the posts. When things are described as metaphors, it's not in the dismissive sense of "just" a metaphor - a clear distinction is being made between direct experience as it is and as we think about it. (See sidebar text.) Even our default working idea about the world is really a habitual metaphor heavy with assumptions rather than something we actually experience as such: that is, the metaphor of a "single shared spatially-extended place unfolding in time". We are cautious of falling into the trap of the reification of abstractions; descriptions are not literally true in some independent way, only usefully relatively true. Except, that is, for the only unchanging fact that there is: that is, the fact of being-aware or "awareness".

I found that the technique that works best for me is dissociating when I am falling asleep or sick with a fever.

I think everyone benefits from becoming dissociated actually - you stop grasping onto parts of your experience and therefore resisting changes overall. For sure, the more you are a "concrete facts" kinda guy, the more important that might be. One of the ideas of the subreddit is that by investigating and adopting different metaphors about our experience, we can in fact loosen that, and "pattern" our experience with a different worldview.

I just need to be cautious and give the caveat to other users that I approach this entire thing with extremely concrete definitions that will only help some and may hinder others.

Please do stick around. It's totally fine to be a "concrete thinker" and discuss things from that platform - you just have to be prepared for others with a different perspective on what "definitions" are apparently disagreeing with you (albeit on a "meta" level). They're not being naysayers really, they're just talking from a different description. And no matter what, we can still talk about our approaches and our experiences. Any ideas that are produced in subsequent conversations, you (like everyone else) can take on board (because you find them interesting or useful) or not (because you don't).

Q1: I am new to this thread and really enjoying the discussions! For now my sense is that the metaphors are a sort of 'user interface' that one creates first, and then uses it to do the jumping/shifting. So whatever metaphor feels most comfortable is the control panel that consciousness creates to move around.

Yes, that's quite a nice way to put it. I'd add, though, that the metaphors can also be a direct reshaping or reformatting of experience. So, you might have a metaphor of the form "I have this 'imagination object' and it has these special properties and acts as a user interface", but also you could view your experience of the world itself as a particular formatting of awareness - an 'imagination object' which can be updated directly by "rethinking" it. This makes sense, of course - that both "the world" and any "user interface" share the same nature. Otherwise, there would be a boundary of "type" and one would not be able to affect the other. (This is similar to arguments about matter and consciousness, and subjective and objective views.)

POST: Oh shit I'm convinced now

Is this all metaphorical then?

In the end, they are exactly the same thing - the metaphorical and the literal - and that, although it can't really be articulated, is ultimately what the subreddit is about. That is, exploring the "nature of experiencing", by performing experiments and questioning assumptions.

Changing the way YOU perceive things?

This "you" that perceives things, what exactly is it and what is its relationship to "the world"? And what is a "concrete thing", precisely? And so on.

POST: Seriously, is this real?

But how does science confirm it? And why do I need a candle to jump between the mirror thing? Why specifically a candle?

Well, "science" isn't equivalent to "real" or "true"; it's just a particular approach for exploring a particular subset of experience. How does science confirm that you are conscious and aware? It doesn't, and never can, because it's not within its sphere of applicability. Science, as usually thought of, is based around cataloguing a subset of experiences which correspond to the "objective world" container concept. That is, it can't really be applied to many 1st-person experiences, because it is "too late" for that; it filters out things which cannot be (apparently) confirmed by the (apparent experience of seeing or hearing) other people confirming it. However, that doesn't mean you can't conduct your own personal structured investigation using similar principles: perform experiments, observe results, repeat results, come up with a description. The only issue is that you won't be able to refer to a stable, external reference point - because the very existence of such a thing is what is ultimately under investigation.

Having said all that, some physicists do push at the "objective world" concept in their attempts to explain certain features that have been observed. Quantum Bayesianism, for example, recognises that the "objective world" idea is a relatively recent introduction, and that a model of quantum mechanics might benefit from putting it aside. See:

- QBism puts the scientist back into science - Nature [<http://www.nature.com/news/physics-qbism-puts-the-scientist-back-into-science-1.14912>]
- A Private View of Quantum Reality - Quanta [<https://www.quantamagazine.org/20150604-quantum-bayesianism-qbism/>]
- What's bad about this habit - N David Mermin [<http://www.ehu.eus/aitor/irakas/mes/Reference/mermin.pdf>]

The last of these is an essay which emphasises how the concepts we use in science are abstractions, and we must be careful not to reify and treat them as "real things that are out there". That is why, here, we often make reference to the fact that descriptions are "parallel constructions in thought", rather than something which gets "behind" the world-as-it-is. Descriptions and theories are, in fact, also just more experiences at the same "level" as any other experience - that is, the experience of "thinking about a description". Finally, as an illustration of this last point, it can be useful to take a moment and attend to your actual experience, and distinguish between your true situation (that of the context of all experiences) rather than what you might think about it (which would just be more experiential content). See for example:

Feeling Out Exercise

... a little exercise can help give us a direct experience of what it means to be the subject to all experience, to recognise that we are not an object and that we are "unlocated". We might close our eyes and try to:

- a) find the "edges" of your current experience.
- b) find where "you" are in your current experience. and:
- c) investigate what your current is experience is "made from". finally:
- d) think about yourself, and then note the location of that thought and what it is "made from".

The conclusions of this are the direct facts of your experience - the only actual facts, really; everything else is transitory. Whatever you think about your experience is also another experience within this context. You can never get "behind" or "outside" of this, because it has not edges or boundaries; there is no behind or outside. (If you think otherwise, then pause and notice that your thought about this is also "within" and "inside".)

I honestly think this is just a big joke. That, or people here are no different from people who believe in Gods and shit.

Well, shit is definitely real. If you don't agree, maybe try doing the two glasses exercise with roughage rather than water. I guarantee results!

More seriously, a difference between "people who believe in Gods and shit" and the topic of this subreddit is that they, in general, haven't had any actual experiences, haven't conducted any experiments. They just believe. Here, the idea is that you put aside what you think about the world (what you "believe") and conduct an experiment or two and see what happens. Results are what informs your view; whether there's something to this or not comes from trying it out. And the "something" in question might not even be what you assume it to be.

As the sidebar takes time to emphasise:

- It is for readers to decide for themselves through personal investigation and introspection whether jumping is appropriate for them or not.
- An open mind combined with healthy caution is the correct mindset for all approaches targeted at the subjective experience.
- Never believe something without personal evidence; never dismiss something without personal evidence.

Again, just thinking about things will only tell you about your own beliefs and assumptions, it won't tell you anything about whether something actually works or not, about the world-as-it-is and the "nature of experiencing". Of course, it is equally fine to simply dismiss it and not bother, seeing it as not being worth the effort. However, you can't reasonably conclude, then, whether it is possible to generate an experience, and what the nature of those experience might be if so. I mean, it's not like it's hard to find out: it is literally no more difficult than transferring water between receptacles. You've probably spent more time commenting on this thread than it would have taken you to just choose a target outcome and do it.

See it's this shit like this that convinces me this ought to be true. But, alright, if this is true, (I'll play for a while...) then how come you guys aren't alerting people that this could be a revolutionary life-changing shit? I mean, if more people researched on this, hell, we could be gods in control of our destiny. A bit too literally on that.

Well, I think that the underlying thinking and observations have been promoted at various times - Buddhism and other traditions are inclined towards similar ideas, and so on. However, there are a few issues when it comes to promoting research:

- It can only be explored personally, from a subjective or 1st-person perspective, because it is "before" the 3rd-person objective view;
- The default assumptions of our concept of "the world", the platform upon which we usually work through our ideas, is exactly the thing that you end up challenging - that is, the idea that the world is a "stable, simply-shared, spatially-extended place unfolding in time" with you as an "object" within it, as per the usual description.
- That in the end you can't actually think about this at all as such, because thinking is itself an experience, rather than something that can get "behind' experience.

Ultimately, then, you can't "understand" this sort of thing, can't comprehend "how it works", because conceptual understanding is "too late", and there is no persistent independent "how things work" in terms of a mechanism for experiencing. We are forced to confront the fact that "the world" is a concept that we think about now and again, which does not necessarily correspond very well to our actual experiences. The problem becomes, then, that descriptions of this are fairly meaningless without the actual experience. Descriptions are pointers to the experience - like "red" is to red, without experiencing red, "red" is nonsensical. That's why there's all this encouragement to actually conduct some experiments, and also why it is suggested that the eventual aim might not about event-based outcomes really, but about investigating the "nature of experiencing" itself (the nature of the-world-as-it-is and your relationship with it).

As this thread demonstrates, though, most people want to "work things out" in thought, rather than actually try something practically, particularly when that something doesn't have a certain outcome. (This tendency doesn't just apply to "dimensional jumping", I might add. People want to "pre-know" things before acting in everyday life too.)

POST: Like many other former skeptics on this thread, I actually had an absurd experience today...

Oddly, owls were chosen due to their relative lack of presence (at the time), although of course that's somewhat location dependent. They seem to be everywhere now, though (funny that). Of course, the point is to then choose different things, and do so repeatedly, and see what happens. Push it until it becomes obviously unlikely (or not, of course: the experiment could have a negative outcome). That's the only way to explore whether you are selecting experience from a 3D context (that is, noticing things that are already there in 3D space), or selecting experience from a larger context (a landscape of patterns, perhaps, an "infinite gloop").

POST: [theory] The header number does hold some value in dimensional navigation.

Hmm. Your calculation kind of assumes that dimensions are "places", like walking through a door to a room with your new desired fact, and that making a shift requires that the header number (room number) is randomly re-selected each time, like spinning a very large (really: infinite,) roulette wheel. This isn't necessarily the case. The important point is, that if we do something to change a specific fact in your experience, there is no particular reason that the number would change as well, because there is no necessary connection between the two facts, no explicit mechanism which forces a number shift. It might change, of course, but without a model that describes this, we can't even say that it is random. This means there is no basis upon which to make a probability calculation. Or at least, one must explicitly lay out the assumptions being used if you do so. [1]

The header number isn't special, it's just another fact. As for "getting back" to something, I'd say it doesn't really matter how many dimensions/states there are (if they were indeed countable), because you select them intentionally, not randomly. If you are shooting for a particular world-fact, you don't really care about the number, unless you are especially picky on the aesthetics of the header graphics.

[1] We can perhaps make some headway on "likeliness of header change" based on the intention used, albeit as just a hand-waving musing rather than anything predictive. For example, if the intention is "it is true that... my car will run perfectly from now on" then there's no obvious overlap with the header number. But, if the intention is "it is true that... the world is now a friendly place", then we could imagine that this broad target ("the world") and the description ("friendly") might result in a collateral shift whereby header number which appears more "friendly", has rounder shapes, or whatever. However, that's still assuming a clear connection which may not always be the case. If we view the definition of the world as a sort of blanket of material, and the folds in the blanket as the world-facts, then changing one fact (pulling on a fold) could have all sorts of collateral effects that aren't at all logical at allfrom the perspective of our usual description of the world, but do make sense at the level of "the blanket and the folds". That is, the world is a continuous, coherent pattern has implications all on its own.

no-way for people to go back

No, it's true, but that might not really matter. All you need, is the ability to turn your thought about what you want, into an experience of what you want. Since the thought is is the form of the fold, you've already got a hold of the part of the blanket you want to shape; you just need to intend the actual shaping. So, although you can't get back to a "how things were before" (and obviously you can't, because at this point you now contain folds of the history of your experience) you can always get to "how you want things to be", in terms of your ongoing experience. In principle, anyway.

yea but the butterfly effects would be random and no true happiness could achieved .. because all you will think is "I caused this"

Not random, though - they would be logically self-consistent (that is, the world as a single pattern would always "make sense"). Unpredictable, perhaps. But even then, you are not limited to intending specific concrete facts; you could also intend more abstract or global facts, such as "happiness" and "calm and order", and so on. What would "true happiness" be, anyway? And the "this" that you caused, isn't events "out there" in an external world; rather, it's moments of sensory experience. Which makes a difference, perhaps.

also... itsn't the world always in a logically self-consistent pattern??.. its just random to us with our limited vision

Yes, I'd say the world always has to "make sense". If something seems random, it's only because our description of things doesn't have connection between the various observations (we're back to the "blanket and folds" metaphor).

POST: Why does the header number always vary so little?

I quite like the "it's a side effect of how the number was chosen" thing as a story, but since "dimensions" (or experiential states) aren't actually numbered in some global scheme, there is no necessary reason why a number that we would judge similar would correspond to a state (or set of facts) that was similar (including the apparent fact of "the declared visual design tastes of Triumphant George"). Of course, one could go further and perhaps suggest that if one asserted that this relationship was true, then one might then have experiences "as if" number proximity and state similarity was a connected thing. We had a bit of a discussion about the 'random number generator' concept recently, worth having a read of it anyway, even if just to disagree with it. (Note that the initial comment on that thread recalls the story wrong, from my perspective, as you say.)

Only problem is that any result will be indistinguishable from...

Well, such is the fun of it all, I suppose. If we adopt the notion that all experiences are on an "as if" basis - with the only fundamental truth being the fact of the property of being-aware - then we shift, pleasantly, from trying to work out "how things really are" (the answer: there is no fundamental "how things work"), to experimenting with the limits, if any, of the relative truths we can adopt. As things progress, then it might become clear that there are no inherent limits (that is, that "your own pattern" and "other people" and any concept of "a multiverse" are indistinguishable from one another and, as "patterns within awareness", equally malleable), but the act of trying to prove otherwise is itself valuable, and a good strategy for demonstrating the contrary position via, well, exhaustion.

Thing is, though, that I'm coming from a paradigm of a "physical" reality...

Which is a good place to start. That stops being a paradigm of "physical" reality, of course, and very quickly becomes a paradigm of "experiential states", or similar. "Physical" reality tends to imply a persistent, structured substrate independent of experience - typically described in terms of a 3rd-person "view from nowhere" - whereas this approach very quickly tends towards a description like: "all that there is, is 'awareness' which 'takes on the shape of' experiential states", or some other frame which casts aside the subjective-objective boundary. This 1st-person (so to speak) perspective is important, because otherwise we get entangled with the idea that things are "happening" somehow "out there" beyond experience. The sense in which everything is always true to some extent, is in the sense of all possible patterns contributing to experience, always, now. But none of it is happening fundamentally in the sense of an out-there world, a "place" with "objects". And so on. The "physical" is a category used for thinking about some experiences; it is an "as if" notion only.

I don't think I can shake myself from disbelieving it through exhaustion...

By "exhaustion", here, I mean that one way to recognise that truth is relative (except the fact of "awareness"), is to generate for oneself experiences corresponding to many different conflicting truths, such that it becomes absurd that there is an independent "how it works", or even a "how it works" at all.

My idea is that "all is math"...

This is pretty similar to the "patterning" model (linked in the intro post, first summarised here). Although it's not so much that "all is math", so much that the minimum description of experience that "makes sense" - that could be said to constitute a "world" at all - is one of a coherent, continuous pattern. It says, in simplified form:

- The only fundamental fact is the fact of the property of being-aware or "awareness" - which "takes on the shape of" experiential states. What you truly are, is "awareness". Right now, you-as-awareness has "taken on the shape of" apparently being-a-person-in-a-world.
- All possible patterns or facts are present, eternally.
- All that ever changes, via intention, is the "intensity" or "relative contribution to experience" of patterns. The present distribution of intensities constitutes the current "state". A state fully and deterministically defines an ongoing experience (the entire sequence of sensory moments that will apparently arise as "time passing").
- Here, "an intention" is a particular fact-pattern and "intending" is the act of changing the relative intensity of contribution of that pattern. This is not done via an act

- (because an act is an experience); it is a "shape-shifting" of state.
- All experiences are on an "as if" basis. Any 3rd-person descriptions about experience are immediately "wrong" (and, of course, arise in the 1st-person as the experience of "thinking about experience").
 - It is in principle possible to adopt any fact-pattern and have experiences "as if" it were true - and the thought of a fact is that fact (there is no external fact to which it refers).

Obviously, the purpose of this isn't just to create some abstract catch-all theoretical description. Rather, it's to provide a thinking framework within which target outcomes and intentions can be conceived of and brought into experience. There is no deeper reality than that, in any case. All patterns already exist, and to think them is to bring them into experience, essentially. The ultimate aim is to have an obvious and intuitive link or overlap between that notion and one's direct experience - an "of" experience rather than an "about" experience - as noted in things like the Feeling Out exercise, and so on.

...Don't buy what, though?

All things exist, it is implied in the model, in the sense of always being present (as "patterns" or abstract facts), but not necessarily contributing to experience. Anything we say beyond that is essentially meaningless. We just end up looping back to saying the same thing in different ways (your list there!). It is meaningless to talk of something outside of experience - because it, "awareness", has no outside; it is unbounded. It is "before" spatial extent, boundaries, apparent time, and so on. Inside and outside are "later" than awareness, than experiencing. And if you do think about such a thing, a separateness or externality, then you are having a thought about that within experience, as an experience. You can't escape this. (If you imagine escaping it, then that imagining is also an experience within/as awareness.) Basically, you-as-awareness are, right now, everything.

Note: **you-as-awareness, not you-as-person.**

It just is.

Or more to the point, I guess: it just is-not. But it still wouldn't be "outside" awareness in the sense that I mean it. Note that this "awareness" we're talking of isn't the same as what we might call "content-consciousness". You might call it something like "the non-material material which 'takes on the shape of' experiential states", or similar. This could be envisaged as a sort of non-dimensional blanket of material, whose only inherent property is being-aware or actually just being, and which can take on the shape of "folds" that you might call a state of experience.

So, the "blanket" cannot get outside of itself, since it is all there is. However, it could adopt a state where there were no folds at all within it (just "void", no content) and then adopt another state, and that second state would have no trace of the void non-experience. Or it could adopt state1 and then adopt state2 which contained no trace at all of state1. In a metaphorical sense, one could say that state1 was "outside of" the state2, but it wouldn't be in a spatial or located sense, but in a content-overlap sense. And of course, we're missing out here that the "blanket" would have sort of implicitly "dissolved" within it all possible arrangements of folds, meaning that state2 would always "really" overlap with state1 in some sense, and indeed every other state. That gets a bit clumsy though; it's easier just to say that all possibilities are present eternally.

Aside - When we say "and then adopt state2" we have to be careful to note that this happens not in time, because time would be an arrangement of folds - "time passing" would be another pattern. These "state shifts" are like "shape-shifting" where the target state could have a completely fresh apparent sequence of moments and "memories". What you really are, of course, is the "blanket".

POST: How long does the two glasses method last?

You don't need to meditate at all, as such; you are just pausing to bring to mind clearly the situations, current and target. Follow the instructions as written. Don't try to introduce any additional effort or "doing" that isn't asked of you. You don't need to "make it happen"; in fact the very idea of doing so runs contrary to the approach.

Treat it like you are doing experiments to see "how things are" - whether there is even anything to this - by selecting changes in your ongoing experience that you'd like. So, start maybe by picking social or work/school situations, and doing it for that. Nothing "reality rule-breaking", just things that would represent a good change. Then do it again for something else, and so on, until you can draw a conclusion and maybe push things further, if you feel you are accumulating positive results that can't be explained just by "it's a coincidence".

POST: My story

...to a time in my life when I constantly felt content?

This question is slightly off-topic for your post, but also very on-topic since it concerns how we might select outcomes: have you truly thought about what "being content" means to you? Since that's ultimately what you want to get back to, it seems. I think it's important to pay attention to how we conceive of our desires or target outcomes, because what idea we build the intention on might dictate whether it really helps us, even if it does come to pass.

For example, if we are bound to a particular concept of self based on how we imagine we'd would be viewed or categorised from the outside - such as being "gifted" or in some other way being perceived as not simply average - then we might think that contentment will come from shifting the world to reflect that self-image back at us, so that we can feel comfortable and without contradiction. However, that image is actually a fiction!

What you truly are is not that concept, and defining outcomes in terms of it might not be a good idea. It can reflect insecurity, which will work against contentment as you are still lumbered with trying to maintain it. It's better, perhaps, to drop the fiction and select outcomes in terms of particular situations and relationships. For instance, rather than getting back to being "gifted" or even some specific time, it might be a good idea to nail what, exactly, you want your future situation to be, and then think of it in terms of the events - moments of experience - that would correspond to that. Such as: receiving the notification that you've got into a particular MBA; having a phone call with your mother that resolves your relationship issues; etc. You get the idea.

Let's have a bash at this:

In regards to the model that this sub uses (open awareness space, patterns etc), do you view it as an absolute reality/fundamental truth of reality?

Generally I try to be clear, and explicitly mention when it comes up, that the only fundamental fact is the property of being-aware or "awareness" - and absolutely everything else is relatively, temporarily true only. In the sidebar it refers to descriptions as being "active metaphors", and that applies to "open awareness" and "patterning" also. They are descriptions which can be used to talk about experience (using them as "parallel constructions in thought") and even shape experience (by intending outcomes in terms of them), but they are not fundamental. What we have, then, is that there is no fundamental "how things are" or "how things work", other than "awareness". (We stop there, because it is simply meaningless to talk of the absence of awareness.)

Note that when we talk of "awareness" we are not talking about "consciousness-of" or "self-consciousness", nor are we referring to "an awareness" or "awarenesses" - only "awareness". That is, a property or context with no particular content. Furthermore, it is important to note that the concept "awareness" is not the "true awareness" (sounds familiar?). This is because the concept or thought "awareness" is an object, whereas actual awareness is not; and is in fact that which the concept or thought is "made from".

So, the "get out" here is that "awareness" is just our handy name for the context - that is, it is not actually part of any model except as a pointer to the context of the model and of experience (the model is itself an experience of course: the experience of thinking about a model). We could also just call it "experiencing" or something like that, to avoid the implication that it is a thing. Hence we sometimes refer to our experiments here as an investigation into the "nature of experiencing".

It just seems funny that we think we can use the information experienced in the dream to explain the dream itself.

That's because that information is also "dreaming" or dreamt. It is important to realise that an "explanation" or "description" doesn't get "behind" an experience; it is itself just another experience, at the same level. You are just having two experiences ("a dream" and "a thought about a dream") and saying that one "is the nature of" the other - but actually they are both just experiences, both a "shape of awareness". There is nothing "behind" experiencing.

So it seems maybe we can only view the universe through perspectives or "as-if" scenarios.

All there is, is "as-if" experiences - really just: experiences. The "as-if" part is because, as we said above, we make up a description and then we say that the experience is "as-if" that description was true. But then, the description itself is an "as-if" experience: an experience "as-if" we were a "thinker of thoughts".

This type of thinking pretty much says that we cannot ever know a "true reality"(whatever that means) and that we'll always be in the dark, which I'm fine with, I like a bit of mystery.

I'd disagree. You are "knowing" true reality right now. It's just that you can't capture it in a thought or a description. It is inherently mysterious in the sense that you can't understand it; but you-as-experiencing always are it. You know it intimately, fully, always. To recycle a metaphor from an earlier comment, the quest to "understand" true reality goes something like this:

- **The Beach:** The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.

And of course, the meta-metaphor above does itself suffer from exactly the same issue that it is highlighting in other metaphors.

Okay, not sure if I've correctly and fully unpacked what you were asking, so do pick up on anything I've missed or misunderstood - or am simply wrong about, of course.

Extra bit: One of the issues with trying to describe our experience is that language, and thinking in general, tends to require a structure consisting of an object and a thing done to an object. However, that isn't what your direct experience is like when you actually attend to it.

For example, rest your hand on your desk (or wherever) and close your eyes. Now, do you actually experience two things touching, "your hand" and "the desk"? Or is it more the case that what you experience is a single "touching" sensation, just "floating" there in your aware space? You might have a thought about it in terms of "my hand is touching this table", but the actual experience does not have two parts. Similarly, when you try to find the "experiencer" of that touching sensation, you can't find one. There is not "the experiencer" and "the touch experience"; there is just "the experience" or "experiencing".

(See also the Feeling Out exercise in that other comment I linked.)

Do you feel knowing this knowledge is to know "everything" or more specifically, the 'framework' of reality?

I suppose what it actually is, is realising there isn't a single specific framework. The fact of the property "awareness" isn't much of a structure to get hung up on, really! So I guess it amounts to a freedom from searching for that, and instead what you have is a sense of creativity freed from conceptual frameworks having to be absolutely true (because there is no possibility of that). **You just are it - always.**

Do you ever, even for the briefest of moments, wish you could "sedate"...

Well, I don't think there is a nihilistic theme to "awareness". Now, the concept "awareness" for sure is empty and boring at times, like all concepts inherently are. But you aren't living the experience of the concept, just as you don't live as your name or job title, you live as a person. However, I think it's probably the case that some people do try to live as the "understanding" - the collection of thoughts about it all - rather than recognise the whole point is that the thoughts were arbitrary in a fundamental sense, the sense of context, and you give up on them except for conceiving of experiential content.

I dunno, in a way nothing's really changed. In fact, literally nothing has changed in terms of the nature of your experience. It is only your description of experience that has changed, and with it a sense of what is possible. What's more, you've probably pondered the nature of descriptions as you went along, therefore you are less likely to get caught up in confusing one experience (ongoing sensory) for another (the experience of thinking about that). The relaxation that comes with that - that you can never "work out" what is "behind" experience because there isn't anything (there's no "outside") - makes for richer moments that are inherently meaningful as experiences, rather than only mattering because of how they fit into a habitual thought-jigsaw.

POST: Experiment to see if this is bullshit

What would happen if I got ten friends and we all checked the header number, then a couple of us jumps. Would everybody's number be the same as the one who jumped? I think the mods are fucking with you people lol

Those ten friends would be "inside" your own ongoing experience, though, so that wouldn't really work.

For sure, you might have an experience "as if" people remembered different numbers, or you might have an experience "as if" the number changed for you but everyone seems to only remember it the "new way". Either way, it doesn't prove anything, other than the "external world" assumption - that is, that the "world" is a "stable, simply-shared, spatially-extended place unfolding in time" with "you" as an object with it - can be problematic when talking about (potential) changes in the (apparent) facts of subjective experience. You are probably taking the concept of dimensions too literally, as "places". The sidebar text is pretty clear about the appropriate attitude to take, regarding both the header number and the subreddit in general. But anyway, the experiment to see if this is bullshit or not is: to actually try it, in the spirit of an investigation, and see what happens (or what doesn't happen, of course).

POST: Matrix and Dimensional Jumping

If "you" are a person-object inside a matrix (that is, a world-experience fully defined by rules, facts and patterns) then it is a problem. If instead the matrix is within you, is a patterning of you (where "you" is now the non-object subject to all experiences), then it isn't. In any case, you don't start with the idea of a matrix and then view everything in terms of it. Rather, you start with your actual ongoing experience and see what fits with that, what is a useful description is. And actually you can use multiple, even conflicting models if you like - because none of them are "what is really happening behind the scenes". All that is really happening is: experiencing (including the experience, at the same level, of "thinking about experience"). Basically, there is no particular reason why "dimensional jumping" should (or should need to) fit in with the idea of a "matrix".

Thank you for your very illuminating reply. I guess in a world of infinite possibilities, if I start believing in an 'overlord' type matrix, my reality will start confirming that for me, as much as it would confirm a wholly dream-like reality if that was my firm belief.

I find "belief" a tricky, fuzzy concept to work with, but certainly: if you intend in terms of something, a worldview, you tend to get the extended pattern of that something by implication, too. See, as an example of a discussion on this, the Kirby Surprise link in the introduction post.

There are several tech billionaires (including Elon Musk) who are convinced we are living in a matrix-type "reality" or program and are funding research on how to break us out of it so some brilliant minds are pondering (and researching) the same questions as you are. And in regards to your last question: IMHO we are in fact breaking out of the matrix type programming (or whatever it is) by DJ'ing.

Hmm. Are those "brilliant minds", though, really? In this particular context, that is. Elon Musk is arguably a brilliant businessman - although time will tell on that, too - and an ambitious fellow, but I wouldn't put much faith in him as regards philosophy or the nature of reality and what have you. Nick Bostrom is the "simulation hypothesis guy" of the moment. However, as with "multiverses", this pretty much amounts to story-making. Even QBism, my favoured formulation along these lines, really can't be tested as such, only used as a perspective through which to view pre-existing observations. It's very easy to fall into the bad habit of the "reification of abstractions" in this area, conflating our ideas with "what's really happening", when what's really happening is that we are fantasising in our thoughts about an "out there" that isn't. All of which is a roundabout way of saying: with things like "dimensional jumping", I think it's best to take things at face value, direct personal experience, and hold back on thinking of it in terms of any conceptual framework - be that a matrix, a simulation, or even as our usual assumptions about being a person in an environment of any sort (that is, an object in a "stable, simply-shared, spatially-extended place unfolding in time"). And if we start off looking at things in a using a certain worldview or description, we should at least cast a skeptical eye on what, exactly, a "description actually is, in the first place, perhaps.

Without splitting hairs in terms of labels (I still maintain Elon Musk is a brilliant mind as well as businessman - a friend works at SpaceX and said he can talk astrophysics with the Ph.D's) my point is that The Matrix as people think it is is being studied and not just randomly pondered by some of the most successful businesspeople in the US. It isn't just a crazy question for reddit readers. Although I am way into mind science and other experiments, I believe in and am trained in as an engineer the scientific method. So yes, I give credence to the fact people with billions want to study this beyond personal experiences people share online or in books.

That's why I linked to Bostrom and Christopher Fuchs so on - but, yes, for sure, it's certainly worth noting that the idea of a simulation-based worldview isn't just a topic that some people talk about on reddit. However, I do feel it's worth emphasising that in and of itself it doesn't mean much; you have to take responsibility for judging it on a personal level, because that is the only way to judge it. Because it is "before" explanations and observations. I feel that the "scientific method" (whatever that is now: it's a bit of a vague abstraction I think, as per Paul Feyerabend; I'm from a scientific background originally) doesn't really apply, with its assumption of a stable external independent substrate of some sort, although the broader category that we might call "structured investigation" certainly does. I'm with George Ellis that that quite fundamentally this is basically a non-scientific topic; it's a philosophical or metaphysical one. Ultimately, it still doesn't really get much beyond George Berkeley's variant of subjective idealism in his Three Dialogues. You can't really get away from the nature of descriptions themselves. People with billions just get to do whatever they want. In and of itself, I'm not sure that makes the "whatever" something to pay more or less attention to. When they are interested in pursuing a topic you find of interest though, it's definitely advantageous to have those people on side...

Anyway, we've brushed past two or three massive topics there, which would be deserving of a much deeper and more thorough discussion, certainly.

I think that if we keep in mind that thinking frameworks are just that, then it frees us to adopt the most flexible or open-ended metaphors while investigating for ourselves. The "life as dream" metaphor fits that bill quite nicely, I'd say!

Another thing is your insistence on the term 'experience' is something that I have pondered for a long time.

That's very interesting, about the roots of the Greek term!

The reason I often use the word "experience" is because it emphasises what is happening directly, it avoids implying a fictitious cause, and it can be used in a way that suggests that the experiencer is the experience - while conveying that this one fact of the matter is always true, regardless of the content of the experience. And so when we say life is like a dream, it's in the sense of saying that they are identical in nature, not just (as the comparison is used) to indicate that waking life can be similarly flexible.

Only 'problem' is that the dreamer protagonist has to figure this out while in the dream. ;)

And, what's more, there is no outside to the dream - so there is no "while not in the dream". Sneaky!

Basically, although it can't be truly articulated, we're reaching for something along the lines of: "What you truly are is the non-material material whose only inherent property is being-aware, and which 'takes on the shape of' experiences on an 'as if' basis, including the experience of apparently being-a-person-in-a-world". All the other stuff about "not being a person" and the various metaphors of "sandcastles" and so on, the conceptual tricks we might use, are really an attempt to draw our attention to that directly, as well as indicate the impossibility of thinking about that. In other words, part of this is recognising that there can be no theory of this, because it is "before" theories, and theories are really examples of further experiences (the experience of "thinking about the theory"; it is not possible to think about what thinking is "made from"). That doesn't mean that creating theories is a waste of time though. While they can't be used to "explain" the nature of experience, they can, like the examples of "active metaphors" in the sidebar, be used to shape experience. The ability to do that is itself a direct experience of one's nature, and so is a type of explanation, in a way. (As is everything else, of course, but deliberately shifting things beyond of one's previous assumptions and patterns draws attention that fact.)

You are either the archer or the target.

Or you are the whole scene. You aren't the archer, or the target, or the action. Rather, you are the entire moment of "An Archer Shooting An Arrow At A Target". Upon examination, you discover that when having the experience of being apparently "over here" and the target "over there", in fact both "over here" and "over there" in the experience are made from you! Metaphorically, then, every attempt to take aim at the target of understanding experience, is an example of you shooting yourself in the foot (and every other part of you/everything).

POST: Understanding the two cups method/how to get more favorable results

Whether it be dimensional jumping (string theory)

That's not the sense in which this subreddit uses concept of "dimensions", though. See the sidebar text and links for details. This does seem to be more of a thesis on a particular variant of LOA, and appears to assume that this subreddit is something along those lines, which it really isn't. It's probably more appropriate for reposting to /r/lawofattraction, /r/psychonaut or even /r/occult, perhaps? Thanks.

However: If I had to summarise it quickly (even though to do so is a little misleading), the topic of the subreddit is more one of "practical philosophy" - related to investigating and leveraging the "nature of experiencing" in the manner of subjective idealism or nondualism.

To answer one point, though:

when asking them about certain principles behind the theory they are unable to give me any information..... information that is crucial to have success in Dimensional Jumping.

Well, they could always ask, I suppose!

However, information is not crucial to its use. In the sense of their being underlying principles which govern its use and explanations of "how it works behind the scenes", that is. In fact, there is no mechanism as such "behind" the exercise: it is pattern. The interesting thing is what it is a pattern of. Which loops us back around to: The nature of "descriptions" is one of the key issues being explored here (as an aspect of "the nature of experience" itself). And so, from this perspective of this subreddit, much of what you say would have to be challenged.

What, for example, is an "unconscious"? And for that matter, what is a "world"? And what is its relationship to "you"? And what is a "belief" exactly? And when answering those questions, how do the answers actually relate to ongoing experience, other than simply themselves being yet more experiences (the experience of: "thinking about answers"). And so on. Ultimately, there's a risk that these descriptions are precisely worthless, because descriptions - while useful for formulating desired outcomes, perhaps - are not themselves causal.

Again, there is no actual underlying mechanism for change. It is in this sense that information as regards some "principles" behind the Two Glasses exercise is not "crucial".

Did you ever consider that the two cups method is in itself a ritual?

I've probably considered all the ways there are of considering it! I suppose it might be described as a "meaningful act", but the meaning doesn't have to be deliberately assigned to it, through effort, in this case.

you have to our intention and feeling into the two cups method or it doesn't work.

No, you don't have to have intention or feeling for that particular exercise. In fact, attempting to deliberately introduce intention and feeling can be a problem. (If this is what, to you, a "ritual" is, then it is not a ritual in that sense.)

no intention or feeling behind it and it is not what you want then you are simply just pouring water from one glass to another.

That rather depends upon what you think the act of "just pouring water from one glass to another" actually is.

It's not like these methods involve a machine that rips a hole in the space time continuum like in a sci fi movie, they're ritualistic at best.

That's not really saying anything, though. In effect, all acts are ritualistic, in the sense of being grounded in metaphor and symbolism (or: patterns). But that is itself a metaphor, obviously. One might have an experience "as if" one is ripping "a hole in the space time continuum" - but then, all experiences are on an "as if" basis, ultimately. There are no "space time continuums" out there to rip, perhaps.

So to say that the other practices are not similar to dimension jumping, or that other methods can't aid in your dimension jumping is ludicrous.

Similar in what exact way, though? Without engaging with what "dimensional jumping" (as used in this subreddit) is, then it is "ludicrous" to talk of methods and practises aiding it. Essentially, you've just added a dollop of LOA-style meanderings on top - well intended, though I'm sure it is!

That literally made no sense at all.

You mean you didn't understand it, which is something different, so I'd be happy to clarify if need be.

POST: After I did the 2 cups method, my school ID photo changed....

You are dimensional jumping every moment, trillions of times per second, already. Doing two cups is just a method to try and do it more consciously.

I'm not sure that's a very useful way to think about it, since it seems to conflate apparent change in sensory experience (the observed seeming transition between already-determined moments which are aspects of the present state) with "jumping". It is more conceptually helpful, surely, to reserve "jumping" as a term for deliberate shifts in state, corresponding to the imposition of a particular fact or outcome. Otherwise the metaphor of "dimensions" no longer has any meaning.

So do you think there's a big inherent risk in jumping? Or that it's not that big a deal like I suggested.

No risk, beyond that of any other intentional act, since all change involves - well, changes. All change implies other changes as part of the accommodation of that alteration within your overall "world-pattern", since your ongoing experience is a self-consistent, coherent "landscape", rather than just random moments. There is no science-fiction or "monkey paw" story type risk involved, though.

So, George. I know this is going to sound stupid, but I need to jump as quickly as possible. I'm going to do the cup method tonight and I need results pretty fast (I mean, preferably when I wake up), is there any way to gaurantee this?

Edit: also, it doesn't matter how specific I want the desired outcome to be right? I want to write a lot on the peices of paper.

Not stupid, at all.

So, this topic is all framed as a personal investigation and the examples are called "exercises" rather than "methods" for a reason. That is because there's an exploratory element to all this - nobody can do experimentation on your behalf, nor guarantee anything for you. Hence the wording in the sidebar text. However, in "nothing to lose" situations - to be blunt: what does it matter? Just fully commit to the exercise as described, and see what happens. Be specific, though, I'd say - but remember that's not the same as being detailed, so don't bother with the hows and whys, just concentrate on the outcome (and whittle it down to the aspect of that outcome that matters).

Aside - Note that, in general the concept behind the Two Glasses is to leverage pre-existing patterns in order to (metaphorically speaking) shift the relative intensity of two possible situations. Thus, making one less prominent or likely in ongoing experience, and the other more so . Therefore, in this model, no "rules of reality" breaks are likely to be experienced, so frame your target outcome with that in mind.

Probably worth repeating this recent comment, which aims to clarify what might count as evidence of a "jump" versus just noticing things might be a bit flaky sometimes:

I would suggest that the only thing that counts as evidence of a "jump", is if the specific outcome you targeted subsequently arises in your experience. (And even then, in order to confirm that it is your intention that leads to an outcome, you'd have to perform the experiment many times, for many different outcomes.) Anything else is, at best, an example of a spontaneous difference between your present memory of an apparent past versus your present sensory experience. It's probably worth keeping in mind that, simply by engaging in experiments related to the possible flexibility of experience, you will be on the lookout for a "looseness" to things which quite possibly was always the case.

POST: Can you jump without using a method?

You might ponder whether the experience, the "sensory theatre", of performing a "method" is itself a result of some sort. However, a method (or applied metaphor) can have value in terms of structuring - that is, selecting or more fully specifying - a particular outcome or pattern, by leveraging your pre-existing patterns as part of its definition. Meanwhile, as you also point out, without some sort of activity you don't have anything to focus on: because if your intention or outcome would have no impact within your current sensory moment, then you won't experience anything at all when you make the shift. For example, if your intention was the form "it is true now that I pass my exams then", then you have no sensory experience of making that change, beyond simply "knowing" that you did so. This can make it hard to resist fiddling about subsequently (and probably counter-intending, or re-implying, the former situations as you go). And so, indulging in an experience of apparently "doing" the change, even that though "doing" is itself a result of intention (the intentional pattern "it is true now that I will shortly experience moving my arms and this movement means-that I will pass my exams then"), is beneficial in terms of helping alleviate that urge, perhaps.

POST: I'm ready to jump, I just have one thing I don't understand...

If you follow the implications fully, then there are no "other people" and there's not even a "you-as-person". Rather you are that-which-experiences and you have "taken on the shape of" the experience of apparently being-a-person-in-a-world. You are never talking to anyone in a fundamental sense; you are just having an experience "as if" you are a person who is talking to someone. As for coming back to your "previous reality" - you never really go anywhere anyway, you simply modify your ongoing experience (of and as you-as-experiencer or you-as-awareness which "takes on the shape of" situations, states and experiences) to align with an idea you have. So if you want to return to the previous experience, the thought of that "previous reality" basically is that "previous reality"

I was hoping for some classic George insight, thank you so much! So you mean my jump will sort of feel like a manifestation?

Well, I dunno - what does "manifestation" feel like? (I know what you're getting at.)

If we just keep it simple: all that changes is that some of the "as-if" facts about our experience become different, from that point onwards. Everything else is just a story about that, a description we make up about something supposedly "behind" the experience. (Those descriptions are, of course, also just experience: the experience of "thinking about experiences".)

So that might be the fact of some object showing up later (which wasn't expected to and wasn't going to happen otherwise, it seems), or it might be the fact of whether you are ill or not, and so on. For sure, it's always tempting to want to create some narrative about things happening "out there" somewhere, which lead to a change. But it's more accurate to simply view the world as a fully-defined pattern, one which includes the pre-determined set of sequential "sensory moments" which will appear. That's what you are changing: the sum of all facts and patterns, which exists now, and which you might call your current "state". Metaphorically, we can think of that state as being "dissolved" into the background of you, with only a particular "moment" of that state "unfolded" as a sensory aspect, in sequence. (Where "you" is you-as-awareness rather than you-as-person; that latter being just a "formatting" of experience, itself only a pattern.)

Q1: *the experience of apparently being-a-person-in-a-world.*

Any idea as to why that-which-experiences has chosen to take on this particular shape?

Does Awareness actively choose what to experience, like a chef, a painter, a composer? Or is It more like a dreamer, a psychonaut, passively going with the flow of patterns (dictated by associations/implications), in an endless reverie?

Well, you are awareness - so if you aren't choosing and redirecting, then it isn't either. Which means it's more like a "material". Metaphorically: a "landscape" which takes on the shape of patterns, experiences, and whose only inherent property is being-aware - rather than an "intelligence" that does things. Hence why I sometimes use the phrase "dumb patterning system" (although the word "system" can be misleading too). So, if you don't deliberately redirect experience, by shape-shifting yourself to another state, then it's more like your second description. If you do deliberately redirect, then it's still like the second one, except that now you are taking on the experience of apparently being-a-chef-painter-composer and are using that identification as a platform from which to shape the rest. If you do this knowingly, though - that is, you actively choose, but you recognise that the "choosing" is itself a result, an experience, rather than a cause - then that's probably the best position to be in, since it accepts that there is no "higher" experience. All experiences are at the same level, and the fundamental nature of experience is being-aware (the fact of all experience, regardless of content), and self-shifting ("intending", "direct imagination", whatever) is the only cause.

I find it hard to identify myself with awareness. I see myself as a tiny subset of it, and I see awareness as something infinite.

It is infinite, but not in the sense of being an infinite expanse, not like a place. It is infinite in the sense of having no particular fundamental form; eternally containing all possible patterns and being able to "take on the shape" of them, making some patterns more "intense", relatively speaking, than others.

Surely, I'm aware, but I'm not aware of "everything".

Why not?

Are you perhaps conflating being-aware with being aware of something as an expanded, 3D, multi-sensory experience? It can be helpful to think of "everything" as always being there, but at a low "intensity" - sort of "dissolved" into the background of yourself. Like in the blanket metaphor below: all patterns are always present, but their relative contribution is different, and only one aspect of the full pattern is "unfolded" into sensory format at any one moment (in fact, that is what a "moment" is). The sense in which you are "awareness" is not the same as the phrase "to be aware of". The latter usually refers to a particular sort of experience. It would be better to say you are awareness as everything, perhaps. A fundamental problem we have here, though, is that this is something that inherently cannot be thought about (see the metaphor of the beach, later).

I can see that some aspects of my experience match my intentions, while others pop up without a direct assertion.

It's not necessarily the case that you deliberately intended anything. "Deliberately intending" is sort of an intended experience itself. There's a bit of a language issue here, but the way I'd suggest "intention" is interpreted is that: "an intention" is a particular pattern whose contribution to ongoing experience is made more prominent or intense; "intending" is the increasing of the prominence of a pattern. And so, "intending" isn't equivalent to "making a decision and then asserting that something will now be true". That is an example, of intention, perhaps. Furthermore, it's important to note that since you are not just a "void" state, you are already patterned. And so, any intention that you do make is done as a modification to that pre-existing structured landscape. Your intention will therefore also involve an increase of the extended pattern of that basic intention, plus an increase in any implied patterns. Every intention is a shift of the entirety of the state, to some extent. For example, if I intend that "it is true now that my arm will lift shortly" then I am also intending the full meaning of that assertion, plus effectively re-intending its full implications (of a body, of the formatting of experience as a space, of time, and all the other stuff). If I do it in response to a fearful situation, then perhaps I am also increasing the pattern of fearful situations - and so on.

So, if I'm all-encompassing awareness, where do those non-deliberated things come from? And why am I unaware of the intentions that brought them about?

Ultimately, I'd say this is about conflating "intention" (the shifting of state, changing the relative "intensities" of all possible patterns such that their contribution to ongoing experience is altered) and "doing things" as a person. They are not the same. The latter is an experience. Also, I feel that the phrase "all-encompassing" is still built on the idea that the world is some sort of "place" that exists in the same form as it is experienced, and that someone you are an object or container which has enveloped them. Now, that's okay as a metaphor sometimes, but it can be unhelpful. It's more accurate to say that what you are is the subject to all experiences; you are what the experience of anything is "made from". And so you don't really experience actually being a person-object in a world-place. Rather, you have experiences "as if" that were so - just as a ripple on a piece of blue canvas is not an experience of "a stormy sea", it is an experience of "a ripple on a piece of canvas" that is shaped "as if" there was a stormy sea. It might be useful to revisit some previous metaphors. We have:

- **The Blanket:** What you truly are is the "non-material material" whose only inherent property is awareness or being-aware, and which "takes on the shape of" experiences. Right now, you-as-awareness have "taken on the shape of" the experience of apparently being-a-person-in-a-world. This can be conceived of as a non-dimensional blanket, within which there are folds (fact-patterns) which represent the world (world-pattern or current state).
- **The Beach:** The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.
- **Patterned States:** All possible patterns exist eternally with and as awareness, and all patterns always contribute to ongoing experience. However, they differ in their relative intensity, their relative level of contribution. Note that patterns are not located; they are unbounded and everywhere-nowhere, "dissolved" into awareness. The current experiential state, then, is equivalent to a particular distribution of pattern intensities, which you might think of as a set of "facts" which fully define a world or scenario (although those "facts" might be quite abstract, sort of meta-facts). One of those fact-patterns is that of "time passing". That is, a particular state fully defines a sequence of moments which unfold deterministically unless the state is shifted again. In order to shift one's state, one must change the relative intensity of patterns, which is done by intending. In this metaphor, "an intention" is a fact-pattern which is to have its relative contribution to experience increased, and "intending" is the intensification of that pattern. There is no method to intending, no mechanism or act involved, and no cause and effect. It is akin to shape-shifting. One simply "intends". Intending is the only cause; all apparent causes are in fact results of intending, in the form of patterns within a state.

Also, check out the Feeling Out Exercise as an example of an attempt to change perspective, the point of which is to emphasise, by direct experience, that you are not a person - and thinking of yourself being a person who is some sort of controller is misleading. Rather, again, you are that-which-takes-on-the-shape-of-experience, and it just so happens you've ended up having become formatted as a being-person-in-a-world experience. And there is no "outside" to that. (I think I've used up my hyphen quota for the day, there.)

TL;DR: You can't have an experience of being "awareness"; all experiences you have actually are "you-as-awareness". A bit like how everything you see is made from "seeing", but you will never actually see "seeing" no matter what visions you have. An issue we have here with language is that it is structured to talk about objects, about content, and we are trying to talk about subjects, context. Hence having to introduce extra meta-level concepts, like "awareness" and, in our illustration there, "seeing".

Ultimately, the experience of being a non-local consciousness, however amazing, is just another arbitrary experience.

I'd certainly agree. There is no "special" experience that is elevated over any other experience. However, there is an elevated recognition, or insight, embedded within that exact point: that is, that all experiences are of the same nature, and that "experiencing" is what you are, rather than any particular experience. The subject or context to all content.

So, what exactly makes the patterning model (or subjective idealism in general) better or more helpful than materialism (where, similarly, we're at the mercy of dumb mechanical laws)?

Not "better", just differently useful. However, the point at which assumptions are made is "earlier" here. Materialism subjective idealism patterning-type, in order of shifting-back of the baseline assumption. And in this case, we are fully recognising the assumptions, and admitting only one single fact as ultimate (see later). We can probably be clearer here, beyond that. The "patterning model" isn't intended to be an explanation of experience. In fact, the very idea of an explanation of experience is meaningless - what with an explanation just being yet another experience: the experience of "thinking about 'experiences'". Rather, it's more of a "thinking structure" which contains only the most basic, and hence the least limiting, concepts which correspond to a structured - patterned, if you will - ongoing experience, such that we have, and such that we might desire. So it's a way to describe experience in a way that's as close to the straightforward notion of experience as a sort of rippled you-as-awareness (with nothing "behind" it, no assumption of any further objects independent of the subject, which in any case makes no sense once you examine your direct experience) and also as a way of formulating intentional change.

The nature of experience isn't something that is thought out; it is something that is directly recognised (although there may be some wrestling with thought, and some experimentation and investigation, prior to that; something the subreddit explores). That recognition is the starting point really, although you can proceed "as if" it were true and get experiences which correspond to it. The recognition being: the only fundamentally true fact is the property of being-aware. All other facts are relatively true only, which is to say that they have varying degrees of contribution to ongoing experience. For the sake of conceptualising this, we say that all facts or patterns are eternally present, just at different intensities. However, of course, that is itself starting from a "later" point, but - as with the "patterning" model - it is a reasonable starting point, because really we are using only discussing "apparent observer/experiencer" type situations, rather than void-awareness type states. Essentially, the "patterning" model (which isn't special, it's just a nice platform from which to discuss the more abstract basic properties of a structured experience, and the lack of limitation, while still being able to use language) says something like: what you are is "that which takes on the shape of patterns, but has no inherent or fixed patterned state, and this constitutes the structure of your ongoing experience" and "all experiences are on an 'as if' basis only".

Again: there is no theory of experience to be had, in the sense of an explanation of "what is really happening behind the scenes". There is only the structuring of experience - and a self-structuring at that.

Does this mean that jumping and manifesting techniques work only when the target is coherent with the pre-existing landscape and its implications?

Not necessarily. Although: yes, if you are simply going to intend an outcome without addressing its conflict with the current state (in which case you'll perhaps get lots of symbolic synchronicity and dreams, but no event or factual change). Something like the Two Glasses exercise obviously just leverages pre-existing patterning (to do with levels and intensities, transfer and transformation, association and assignment and so on) and doesn't deal in discontinuities and suchlike. It doesn't make any attempt to adjust the more abstract patterning upon which sensory content is structures; it only intensifies (so to speak) a particular "outcome-fact" in preference to others, with the rest of the "world-pattern" landscape being metaphorically dragged into alignment with that, like pulling a fold on a blanket of material (as before). Meanwhile, the Owls of Eternity exercise operates more directly, but deforming yourself with the extended pattern of "owl" without specifying spatial or temporal restraints - hence it's a bit like scribbling an image onto a television screen, only the extended patterning means that you get the full meaning, the symbolic associations, coming into play rather than just literal owls.

Now, the lessons from those two exercises can be applied further:

In the first exercise, we are taking pre-existing localised patterns of the "landscape" and adjusting their relative intensities - selecting them form the landscape, and modifying their prominence. In the second exercise, we are intensifying a general component pattern across the whole landscape, everywhere and everywhen, in quite abstract fashion. Combining the two, we might consider how we could modify the general structure of the landscape we are starting with, the more abstract formatting rather than just particular outcomes or world-facts...

In short, this approach - which isn't really an approach, so much as a recognition of "self-shifting" independent of any particular "method" or apparent "mechanism" - needn't be applied just to events. You could apply to to the structure of experience itself. In that way, your intention - specified in terms of a particular interpretation of "landscape", such that the intention is basically "outcome + formatting" - needn't be limited by that pre-existing landscape, perhaps. Hence, in the sidebar, the reference to "active metaphors" and the notion of configuring experience to be in terms of, say, a sequence of moments floating in perception, a memory block, or whatever (leveraging Jorge Luis Borges's metaphors, for example). Or, indeed, a "patterning" of an "imagination space", or you-as-awareness.

POST: If everything is merely a super realistic 3D imagination of the mind, why cant we instantly change reality just by consciously choosing to?

Why would you expect to be able to? Just putting the word "merely" in front of something doesn't make it "just" that simple. "Merely" imagination is, I assume, a shorthand for "merely a structured, coherent imagination experience". It's not like you are just experiencing single images at random. For example, if you have imagined-that you are in a stable, external world which is persistent, then part of that imagining is that it doesn't just constantly deform according to your every passing whim. The fact that your current experience is not just a random mush - that is, that it has structure or patterning - suggests this is the case. Even when you are "merely" in a dream, it is possible to deliberately create dream environments which behave exactly as the waking life environment does, to the extent where you really can't deform it - see "persistent realms". Of course, in that case we have fully and deliberately intended that it be a rigid environment, whereas for waking life we never did; we simply accepted and then continued to imply that it was the case. This is what makes this current experience, in theory, more flexible (without having to ditch it entirely and seed a new one). Also, there's the obvious question: have you actually experimented with changing something by consciously deciding that it is the case? That is, not just "try" to do it, or "sorta kinda" do it, but genuinely and with full commitment assert that something is true - in the form of "it is true now that this happens then", for example. (But not using the words, necessarily; words in and of themselves don't matter much for experimenting with this sort of thing, it is the intention that they are a part of that matters. If you just say the words, then you are just generating the experience of sounds.)

Lots of people come to this and say something like, "why can't I fly just by wishing it, then?", but if you ask them, they haven't ever actually conducted the experiment. They don't know whether or not they can fly by wishing it. Which isn't to say that you can - however, the attempt might itself bring about an outcome, an experience, that is informative in some way.

When does this enlightenment carry over to the social sphere and to other people?

Ultimately, I'd suggest, it doesn't carry over because the final result is that there are no "other people" - and in fact there is not even a you-as-person, at least in the sense of an independent object in a location, rather than an "as if" experience. This also leads you to a particular interpretation of "to act without acting" (or "non-doing"). That is, that you never act causally anyway; all your experiences, physical, mental and world, are in fact "results". The only cause is intentions (and their implications), which are equivalent to deformations of your current state, or "patterning".

I know DJ postulates that by changing our own individual 'construct' of reality we can change the whole world around us...

When you dig deeper, it's not that you "change the whole world around us" - because the very idea of a "world" is challenged. In other words, the whole notion that what you are is a sort of person-object which is located within a "world" that is a "stable, simply-shared, spatially extended place unfolding in time" is recognised as an assumption. Now, you may have experiences "as if" that is the case, but it is not fundamentally true. In fact, what you actually are is recognised as "taking on the shape of" the whole current experience, including the apparent sense of being "over here" and other stuff being "over there". You are actually the whole moment - directly, your actual experience you are having right now.

POST: [deleted by user]

The owls of eternity exercise is a form of what I call Active Will, but one might replace that with...

Ultimately, I suppose, we find ourselves searching for a terms which simply means "redirecting experience" or "asserting a pattern into experience". But then the term often makes it seem like a "special" thing. But it's nothing special: the thing-itself is just the raw "shape-shifting" that comes with being "that which experiences, and that which experiences are 'made from'". Deciding to move your arm is that thing also, or more generally: changing direction to a new destination whilst the experience of "walking somewhere" is already occurring. The names we use, then, end up referring to a particular pattern or context for an intention, rather than any actual method or property. Actually, this can present a hurdle if we don't realise it: the urge to attempt to find out what it is we are "doing" that brings about outcomes is, despite being attractive and addictive, always going to be fruitless, because it is the nature of "doing" that is the key, rather than any specific "doing". The question to ask is, after a fashion: "What is doing made from?". And so, to names: "Active will" might be used to refer to cases where you shape-shift a pattern overlay into your experience directly (the owls); "dimensional jumping" might be used to refer to cases where you shape-shift an outcome-pattern blended with a structured metaphor-pattern; and so on. Always, though, the "magic ingredient" is simply the fact that you-as-awareness "takes on the shape of" experiences, and so can "shape-shift" causelessly in order to modify that experience, to create an experience "as if" something is apparently true that wasn't true before.

Well, since last year I've been developing a method for understanding and controlling the "magic" in this world.

So the "magic" in this world turns out to be the magic the world is within and "made from". That is, it is within and of you-as-awareness. And therefore, strictly speaking, nobody actually has a "latent ability" - because they are not actually a "body" (not fundamentally a person, just having a person-formatted experience) and they can't "have" an ability because in fact it is just a natural consequence of the "nature of experiencing". That is, the apparent world is a pattern within you, where "you" means you-as-awareness rather than you-as-person.

I'd flip it around, because talk of the "self" can get a bit circular.

So, "awareness" here loosely means something like the "material" that is all that fundamentally exists, but which "takes on the shape of" a particular state:

- "What you truly are is the non-material material whose only inherent property is being-aware, and which 'takes on the shape of' states and experiences on an 'as if' basis, including the experience of apparently being-a-person-in-a-world."

From there, your current experience might be person-formatted, but you are not a person. Similarly, you don't really have a "self" as such, but you might at the moment have a "self" that you think of yourself as occasionally (a conceptual self) and a sense of "self" that feels like you (a patterned self, perhaps). But you don't have a self in the sense of being an object within and relative to an environment.

Now, in this description, there is no creation (because time and change are part of a particular sensory experience, which is itself an aspect of a state, rather than something which experiences occur "within"). All possible facts and patterns exist always, eternally. And so: The "unknown", then, is always known, directly, because it is always there, and there is no "outside" to experience. You can think of it as "dissolved" into the background, always. If by "unknown" you mean "experiences that I haven't had yet as 'unpacked' sensory images or thought images", then in this description those patterns exist, now, but they just aren't contributing to ongoing sensory experience, relatively speaking, to any notable extent. And intention, or shifting, would be the act of intensifying one fact or pattern relative to the others, such that it is prominent within ongoing experience from that point onwards. Like a rebalancing of the contribution of patterns, metaphorically speaking, from some sort of "infinite gloop" or non-dimensional landscape.

I think I'd throw away the notion of "brains" doing anything, initially anyway. Have you ever experienced being a brain? The idea that you are a body or a brain is something you infer from the content of your experiences (you see "people" and if you open them up you find "brains") and certain little mental castles of thought you habitually wander around in - but your actual experience, if you attend to it, is something quite different to that. The highlighted phrase in the comment above is an attempt to capture that essence of your actual experience, the context within which all content arises. (For illustration, see also: the Feeling Out exercise in this comment, but actually do it rather than just think about it, since that makes a difference.)

You don't actually experience having five senses, or a brain interpreting anything. (Even in a more mainstream approach, without getting into the nature of experiences, this is true. Recent article related to that, [here](#).)

Rather, you just experience a seamless single experience, "made from" yourself. And then your interpretation of that experience, your thinking about it, is also an experience. There is no "outside" to experiencing; all descriptions are on an "as if" basis also, and are themselves within experiencing, within you-as-experiencer. However, if you view "your brain" as simply a metaphor for the patterning of experience, a handy container concept to which we attach our discussions for convenience, then that's okay, perhaps. If done knowingly. That is in fact how we use the term usually, as a metaphor, albeit without recognising that we are doing so. This blurring of the lines between literal and metaphorical isn't a problem generally in daily life, but when we explore this particular topic, it can trip us up.

Aside - For example, in what sense do you actually experience thinking "in your head"? Thoughts may seem to be located in that area of space, but surely all of your experience would be in that space, not just your thoughts, if we were to take the notion seriously?

And so, we have that it's not that "we only experience a fraction" of all possible experiences because of our brains and our senses allowing us. That's just a way of asking: "how come I'm not experiencing infinity right now?"

I'd say that it's better to say that the patterning or shaping of you-as-awareness equates to a selection from all possible experiences (which might be conceived of as being "dissolved into the background" and available). Nothing is filtering or interpreting as an intermediary, as a process of steps. Rather, you have selected (or implied via other selections) an experience. A formatted, patterned experience of apparently being-a-person-in-a-whole-world in its entirety, as if from a "infinite gloop". A bit like being a blanket of aware material, and shaping yourself into folds, where the folds are the shape of this-total-situation with an aspect of that being this-sensory-moment.

everything gets complicated and complicated...

I'd respond to that by saying it's the opposite: it is actually super-simple but it cannot be conceptualised. It's the attempt to create a thought-structure about it that gets complicated, in an attempt to describe something in terms of parts (objects, mental objects) that does not have any parts (the undivided subject which "takes on the shape of" experiences). The thing-itself has precisely zero complexity (or infinite complexity, but really potential is the better word). Consider the metaphor of The Beach, which illustrates how you can't think about the context of your experience (the context being what you actually are, and hence you are also the content):

The Beach

The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.

To continue:

it's like there is a pattern of some sort or maybe it is just a delusion...

Well, there is a bit of an issue here, which is that if you go on a search for meaning, you will tend to pattern your experience with the pattern of "searching". Similarly, if you have a sense of complexity, you'll tend to pattern it with "complexity". More abstractly, more meta, if you try to solve ever-trickier patterns, you'll pattern your experience if "patterning".

Aside - Check out the introduction post and the link to Kirby Surprise's interview about his book Synchronicity. Lots of nice examples of "patterning" there. And it also illustrates how this stuff can drive you a bit mad, because you keep getting evidence of whatever your current approach is, because your approach tends to imply its own pattern.

All of which points to the fact that it is not the content of experience (sensory or thought, which are identical in nature anyway) that is where you find the insight, it is in noticing to context to all experiences. Basically, you never "work it out", because the nature of experience is not in fact a "problem" to be "solved" or a "secret" to be "understood" (both of those are in fact arbitrary structures: patterns).

Yes i see that i am getting a little bit mad i am going to put this psychological battle down for some time for my own sanity, I will look into that interview and after some time the battle will continue as it always continues, that is a fundamental part of human spirit its curiosity and inquisitiveness....

For sure, but be warned: holding the idea that "the battle will continue" already sets up your experience as one of "battling". And "curiosity and inquisitiveness" in terms of finding a solution to "reality" will just generate more content of a "curious" and "inquiring" sort. The eventual insight is that no particular experience or idea is the "answer", but instead the fact of all experiences are it. It's a change of perspective, rather than a particular idea or whatever. Anyway, you'll likely find that a lot is to be gained by just putting all this aside for a while, and just relaxing into daily life. Then, when you do pick it up later, your focus is more "open" and your relationship to whatever you've been reading and thinking becomes clear.

...

Q1: I've never really looked into the owl thing. However when I was a kid my dad taught me a cool trick. We would often sit on the porch and watch cars drive by. We would notice the makes or colors of cars more often if we were actively looking for them. Same as when you might be thinking of buying a new car or a friend gets a new car. You end up seeing more of that kind of car if you keep thinking about it. Seems like sort of the same idea.

Commonly referred to as "confirmation bias", although that term is often used misused in this context.

[QUOTE]

Confirmation bias

Confirmation bias (also confirmatory bias, myside bias, or congeniality bias) is the tendency to search for, interpret, favor and recall information in a way that confirms or supports one's prior beliefs or values. People display this bias when they select information that supports their views, ignoring contrary information or when they interpret ambiguous evidence as supporting their existing attitudes. The effect is strongest for desired outcomes, for emotionally charged issues, and for deeply entrenched beliefs.

[END OF QUOTE]

Regardless, it doesn't really work as an explanation for an increase in apparent events though, necessarily (and it's not really an explanation for an increase in observations either, really, as is). From a previous discussion:

Basically, we should ask: what exactly is "confirmation bias" in this case?

If the term is taken to mean "noticing patterns that were already there in a three-dimensional environment (a place)", then the extreme experiences one can have often seem to conflict with that. If, instead, we expand the term to mean something like "selecting patterns into sensory experience from a non-dimensional environment (an infinite gloop)", then we've got a description that's more useful, perhaps. In the first case, "confirmation" refers to confirming ones prejudices. In the second case, "confirmation" is more in the sense of confirmation of a property of experience. In neither example, of course, do we have access to an independent external reference against which to measure the "confirmation". However, in the case of "dimensional jumping" and that exercise, we explicitly recognise this fact - and pushing against ("confirming" or not) the standard "world experience" assumptions is actually the basis of the exercise.

A related term is the "Baader-Meinhof phenomenon", which simply refers to seeing more of a thing you have recently encountered.

[QUOTE]

Baader-Meinhof phenomenon

The Baader-Meinhof phenomenon occurs when a person, after having learned some (usually obscure) fact, word, phrase, or other item for the first time, encounters that item again, perhaps several times, shortly after having learned it. This is a specialised version of the effect of serendipity.

[END OF QUOTE]

However, since in the case above we are performing a deliberate experiment and are possibly expecting an outcome, "confirmation bias" is more appropriate as a challenge to someone's experience and its interpretation. (Although, as I said, most people find this does not easily account for the results, if they persist with it. That is for people to make up their own mind about, though; this is very much a personal undertaking.)

Aside -

Meanwhile, you'll notice that the Wikipedia page above is now removed from main Wikipedia, and the B-M phenomenon is referenced unlinked under "Frequency Illusion" in the article List of cognitive biases [https://en.wikipedia.org/wiki/List_of_cognitive_biases#Frequency_illusion]:

Frequency illusion - *The illusion in which a word, a name, or other thing that has recently come to one's attention suddenly seems to appear with improbable frequency shortly afterwards (not to be confused with the recency illusion or selection bias).*
This illusion may explain some examples of the Baader-Meinhof Phenomenon, whereby someone hears a new word or phrase repeatedly in a short span of time.

I included the other link, though, because I think the original full B-M page is a little more "honest", since at least it references the origin of the phrase and offers several views, rather than simply a throwaway "explaining away" line which implies it is essentially already understood. I think that many references get slightly ahead of themselves in treating naming and categorising as equivalent to explaining and understanding. Creating terms and connecting them is not the same as truly incorporating them into a useful body of knowledge. In fact, I'd generally take a short pause when you encounter the word "explain" being used with reference to psychological studies, since it often seems to me that there is a philosophical gap lurking beneath it. And also, perhaps, one should be somewhat cautious about the original studies even on their own terms [<https://www.theguardian.com/science/2017/feb/01/high-tech-war-on-science>].

POST: People around us

I don't understand how another person can see or understand what is happening when I am jumping and changing myself.

Is that what you experience though? Do you actually experience another person "seeing or understanding" as such?

how do they comprehend what has just happened

They don't comprehend. At least not in the sense of "having an experience" like you are. The important thing to realise, perhaps, is that you are not having an experience as a person, you are having a person-formatted experience - and this is different. You-as-person doesn't have experiences either. Only you-as-experiencer or you-as-awareness is having - really: "taking on the shape of" - an experience. I'll see if I can clarify that by talking around the subject a little (excuse length).

The Realness of People

Now, this doesn't necessarily mean that people aren't "real", but it does mean that they are not "real" in the sense that you previously assumed them to be (it is worth pausing and pondering what exactly you mean when you say the word "real"). They are more like, say, patterns of experience within you-as-awareness, as indeed are you-as-person. Consider, perhaps, what it is you actually experience, versus the stories or descriptions you think about experience (which are really just more experiences, of course: the experience of "thinking about experience"). Do you really experience yourself as a "person-object" with a "world" that is a "stable, spatially-extended 'place' unfolding in time"? Or is it more like a line of thought, unfolding spontaneously in an aware space, albeit a 3D multi-sensory thought?

This latter idea leads us to the similarities between waking life and lucid dreams, which are indeed often conceived of as being essentially an unfolding thought. It is possible, in a lucid dream, to create "persistent realms" which are essentially indistinguishable in vividness and stability from waking life; the only difference is your knowing of the context of the dream. It quickly becomes apparent that they identical in nature. And, of note, within the dream you experience "other people" who apparently know things

about the world that you don't, and indeed the whole world is laid out despite you not explicitly defining it.

The Real You

Now, the "you" in a dream obviously isn't the "real you". And so it is in waking life: the experience of being a person isn't the "real you", in a fundamental sense. But are you a "figment of your imagination"? Yes and no. While the entire "world-pattern", including "you" and "other people" might be said to be somehow "dissolved into the background" of you-as-awareness, this you-as-awareness isn't a thing or an object or a being. It is more like a material. Essentially, the final observation is something like:

- What you truly are is the non-material material whose only inherent property is the fact of being-aware, or "awareness", and which "takes on the shape of" states and experiences. Currently, you-as-awareness has "taken on the shape of" the experience of apparently being-a-person-in-a-world.
- All possible patterns, facts, situations, experiences, moments, formatting are in effect eternal and always present, "dissolved into the background" of you-as-awareness.
- The current "state" of you-as-awareness might be described as the current selection of patterns or facts which are presently contributing to your ongoing experience. While all patterns are present, some are relatively more "intense" than others. (This provides one way to think about "intention" and modifying one's experience.)

And so the sense in which everything is a "figment of your imagination" is a limited, because it isn't "your" imagination in the personal sense, and it is not "imagination" in the sense of an ongoing, maintained process. And because "creation is already done", you are only ever adjusting the shape of a metaphorical "world-pattern" landscape; there is never an incomplete world, there is always a complete and self-consistent experience because there are no "parts" to experience.

Feeling and Understanding

Meanwhile, I tried to get down a decent description of this previously which addresses some other points in this comment and this comment. They might be worth a glance, particularly the first one which is specifically about "in what way are other people real?" Do check out the Feeling Out Exercise also. The metaphors might be useful for this query:

I know that our reality and consciousness and life is so complex that one may never truly understand, but at least we can try.

In fact, you can't understand it, and there is no point in trying. By "understanding", there I mean turn it into words or concepts. You can understand it in the sense of simply knowing it directly, being it. But you can't create a description which captures it - because descriptions are themselves just more experiences, "within" you-as-awareness. Experiencing has no "outside", and so there is no perspective from which to create a model which captures it (see: The Feeling Out Exercise, for example). A metaphor from the second link which tries to illustrate why you can't really ever think yourself into a conceptual understanding of experience:

- The Beach: The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.

In a way, the problem is that the direct fact of the matter is so super-simple that it is impossible to grasp it by anything other than directly attending to your actual experience.

Have you ever read Process Philosophy?

I've enjoyed things like Eugene Gendlin's A Process Model, for example. I've probably not read into the subject as deeply as I might (recommendations welcome). Overall, I'm inclined towards something like a description involving apparent dynamic processes which are fully defined as part of a "landscape" which is static between shifts, with that shift not being a process because it is non-temporal as a self-shifting of the whole. (Sorry if that sounds muddled.)

POST: How do I know if the two glass method really worked?

You know it really worked when the outcome you targeted arises within your experience. That's it. However, you should treat it as more of an experiment (it's deliberately labeled as an "exercise") than a method or technique (in particular, those terms contain assumptions which might not be valid and the exercise is in part aimed at revealing those). So, you conduct the experiment as written in the instructions, then you see what results arise subsequently, and perhaps contemplate the implications of those results, using them as the basis for further experiments. It's not as simple as performing a pass/fail or worked/didn't act. But the first sentence still stands: something "works" when you get the intended result; anything else is an experience of something else, albeit perhaps related; there are no necessary "signs" or experiences other than that. We could perhaps describe an intention as being of the form "it is true now that this-outcome happens then". If that is the case, then why should there be any sensory experience of the outcome now, when the result has been targeted for then? And so beware, also, the urge to try to have an experience of "doing": the experience of "doing" would itself be another intentional result, rather than a cause of any subsequently observed change.

POST: [deleted by user]

So if you do a method like the two glasses, your perception is changed, because I read that you're not really "jumping" to another dimension.

Things to ponder are: Perception of what, exactly? Have you ever experienced the thing you are having a perception of? Or have you only experienced perception? If the latter, then all you've ever experienced is... experiences. Everything else is just a description about experiences (which is also an experience: the experience of "thinking about experiences"). And that includes the description consisting of "I jumped dimensions". And then, what is the difference between "really" jumping dimensions versus having an experience entirely "as if" one has jumped dimensions? So: Ultimately, the point is to conduct the experiments, and see what happens. And from there, you may draw the conclusions that your usual assumptions about your ongoing experience are not completely correct. Here, you are investigating the "nature of experience", and also as a byproduct you will be investigating the "nature of descriptions about experience".

POST: A couple of questions on intention

Kind of hard to be specific with one word.

You don't need to be - because it is not a "request to the universe" type deal. It is a direct manipulation. The word is a direct "handle" onto a pattern, a pattern which could not be fully unpacked into concepts and articulated anyway. You can be specific in your contemplation of what you want (see below) but if you write a description, you are often just attaching the description (as a sequence of words) to the process, rather than that actual pattern (from which those words emerge). Descriptions and patterns are not necessarily two-way or reversible associations. From a previous comment:

Something to note: there is a difference between writing out a description, say, and actually linking objects (mental or physical) to particular situations or patterns. So no matter what the format, be sure to actually ponder your current and target states, and let the words come from that contemplation, rather than just writing out something or working out the words to use intellectually. That way, the words will be "handles" onto those specific states, rather than simply unattached words that will trigger a more general extended pattern. Apart from that, as someone else mentioned, you are meant to do this once, then put the glasses away and carry on with your life. The change happens when you do the exercise - it becomes true now that things will happen then. Checking and tinkering afterwards tends to imply the initial pattern again, essentially re-intending the starting point, a bit like being in a standing position and confirming just how "standing" you are by sitting down again.

Impeccable timing! Considering I've not had much time the last couple of days. An owl must have tipped me off that there were some comments needing written! ;-)

In order for our minds to accept the new pattern as feasible/possible...

Hmm. I don't think our minds do have to accept the new pattern as feasible/possible. Our minds aren't things which actively filter or block things in that sense, like guardians. (Usual caveat: you can certainly have experiences "as if" that is the case, but that itself would be an example of patterning rather than something separate that is "happening".)

... that word has to be meaningful enough arising out of contemplation of the desired new pattern for our minds to accept it.

Our minds don't need to accept anything, because they aren't being asked to do so here. Your "mind", in this case, is just the mental structures you are unpacking into experience; there is no "mind" other than that. So you don't need to worry about "how the mind works", because in fact, the mind doesn't "work" at all. All that "works", is you, intending!

In this case, "meaningful enough" simply refers to that word meaning that intention, for you - corresponding to it as a part of it. If you feel the word captures the situation, if it "feels right", that is enough. It isn't any more complicated than that. The reason a single word is suggested, is that this limits it to just the pattern that you have a handle on, plus the extended pattern of the word itself. As you move towards having phrases and sentences and drawings, you start to move away from intending the outcome as it is wordlessly conceived of (the pattern itself) and towards intending the sequence of words and their extended meanings (the description about the pattern). It is fine, of course, to use a couple of words if one feels that best captures the current and target outcome states (- although I'd say there's rarely really much need, so long as one accepts that the words that arise often aren't one that you would choose "logically", and sometimes don't actually make sense in those terms. However, since the instructions are intended to be followed as they stand, with no prior knowledge, specifying a single word is used helps avoid misconceptions about what is being done from getting in the way.

This is because most people's default idea of it initially (and even later until corrected) is of the "I submitting instructions to my mind/universe/subconscious which then carries them out on my behalf" form, when that is not the case. And in fact one of the points of the exercise is to reveal that this is not the case. That is, there is nothing "happening" in the background, afterwards, to bring about the results. There is no separate intelligence that is listening and doing stuff for you. You are the only intelligence, the only cause and actor, in this exercise.

TriumphantGeorge Compendium - Part 11

POST: Perfect method to check if a jump was successful.

Hmm. This process is surely essentially just like checking for changes versus the header ID, with some extra activity and assumptions but essentially the same outcome, which as emphasised in the sidebar: **Header No. 982** - *Please note that a shift in your experience does not require a change in the header number, which should be treated as an emblem of change and a symbol of potential rather than an ID.*

The problem is, basically, that using an ID or a hash or whatever (to check for an intentional jump) is making an assumption that there is some connective process that links changing your altered fact to other facts. This is not necessarily the case. If you observe the hash changing, then it is not necessarily connected to an intentional "jump"; you can just be observing a general looseness to your ongoing experience versus your memory. And: We also have to remember that the "dimensions" referred to here are metaphorical, in the sense that they are not actually "places". Rather, they are a way of conceiving of and structuring change; they are more like experiential states. So it's a bit of a tautology to say "check for a hash value change, that is a sign you have changed dimensions" - because "change dimensions" is really just a synonym for "change of fact" or "state" in the first place.

I think ultimately, as per this recent comment:

You know it really worked when the outcome you targeted arises within your experience. That's it.

Having said all that, this sort of thing is fun to play with anyway, since it encourages us to be on the lookout for a certain flexibility to our experience, and to contemplate the implications.

...

As evidenced by the famous quantum double slit experiment, merely observing something collapses it from a probable state into a determined state.

Although, to chime in, the idea of there being a "collapse" is an interpretation. There is no actual probable state really; there is no collapse; those things are part of a narrative. What you actually have, is a description which lists possible observations (and in QM it's really a mathematical structure with no inherent meaning as such), and an observation that takes place. The idea that those possible observations "exist" prior to the observation, is a bit of an interpretative leap that many choose not to make - there are lots of different interpretations and none of them are, or can be, "correct" - since we're really just dealing with conceptual frameworks here rather than "things" (and almost not even that, in the case of QM). It's really a philosophical argument, there, rather than a scientific one. Aside - See for example: N David Mermin's What's bad about this habit? article and Richard Conn Henry's The mental universe piece. Also, the fun survey Surveying the Attitudes of Physicists Concerning Foundational Issues of Quantum Mechanics. EDIT: For completeness, since I'm linking away anyway, a nice accessible chapter providing A Brief Survey of Main Interpretations of Quantum Mechanics.

Being aware of something means we have a quantum connection to it.

I'm not sure that saying we have a "quantum connection" is meaningful. What we do have, though, is an experiential relationship. That is, that everything we experience, we experience as "awareness" - both in the sense of us being "awareness", and in the sense of our experiences being "awareness" also. We are not separate from our observations, because they arise as and within us. However, we should probably make a distinction here between "observations" in the sense of a direct experience, and "observations" as abstracted conclusions about direct experience. Failing to recognise the difference can get us in a bit of a tangle. Descriptions are experiences, too: the experience of "thinking about experiences". We can never get "behind" our experiences or explain them, therefore. We just have further experiences.

Which leads us to: our ongoing experience of the world doesn't work according to "QM" as such; that is just one possible description after the fact. Such descriptions come after or in parallel to your experience, as thought; it doesn't cause your experience. In the case of "dimensional jumping" we are actually dealing with the domain "before" descriptions like quantum mechanics, so they can't actually help us make decisions for actions in terms of them being a "how things work". At the level of "experiencing", we might actually say that there is no "how things work" as such.

Having said that, we might use such models as a way of intentionally structuring or patterning our experience "as if" they were true, as "active metaphors". But this is a reversal of the usual assumptions we have about such descriptions. Here, intention would be the cause (via adoption of a certain pattern or formatting implicit in the defining of the outcome) and the correspondence to a particular description is an aspect of the result. All this is, of course, stuff to experiment with. But it is why this is all best viewed as an experiment or investigation, rather than a "technique" or "method".

(Added some headings to break it up a bit.)

Observations, Realms, Experiences

You can directly observe what happens and start to figure out something about our realm from it.

Yes - but one must be careful how one approaches this "something" in our case. You aren't talking about just observing (as in experiencing) here; you are talking about observing with reference to certain concepts and then drawing conclusions in terms of them, and the assumptions underlying them. And that's maybe a bit of a problem for us in this topic, because those assumptions are what we're examining. In particular, the conclusion that quantum physics tells us something about our realm being in the format of quantum physics is problematic. This is particularly so versus other types of theory, because quantum physics is a codification of a set of observations, it is not "what is really happening" and has no description of that sort. It is not meaningful in and of itself. While things like "atoms" are also really a conceptual framework which is useful rather than "true" (the world isn't really made from "atoms"), the component concepts at last have a discernible meaning, because the concepts came first. With QM, the equation came first, and was kind of ad-hoc dragged into being, rather than derived from a worldview.

From the Richard Conn Henry article in Nature, for example:

Likewise, Newton called light “particles”, knowing the concept to be an ‘effective theory’ — useful, not true... Newton knew of Newton’s rings and was untroubled by what is shallowly called ‘wave/particle duality’...

Discussing the play, John H. Marburger III, President George W. Bush's science adviser, observes that "in the Copenhagen interpretation of microscopic nature, there are neither waves nor particles", but then frames his remarks in terms of a non-existent "underlying stuff". He points out that it is not true that matter "sometimes behaves like a wave and sometimes like a particle..."

The wave is not in the underlying stuff; it is in the spatial pattern of detector clicks... We cannot help but think of the clicks as caused by little localized pieces of stuff that we might as well call particles. This is where the particle language comes from. It does not come from the underlying stuff, but from our psychological predisposition to associate localized phenomena with particles."

My actual point: this means we can't really extend it for our purposes, in terms of describing the nature of experience itself. People who do take QM to be literal are perhaps the same sort of people who say that the universe is mathematical. Which is like a painter saying that the universe is made from paint. I'd add that the QBism interpretation does try to tackle some of these issues head on rather than handwave them away, though, and is worth a read if you haven't already: here and here. It ends up covering some of the same philosophical ground that we confront here (it's interesting, in the Nature article, to note where N David Mermin balks at following through on the implications of his idea: it's the bit about non-overlapping moment-memories).

Consciousness, Links, Measurements, Descriptions

I think the main takeaway from all of it for me, is just that there is something that links human conscious awareness with what is being watched that cannot be physically measured.

I'd say that the double slit experiment tells us more about the nature of descriptions than experiences.

- First, going back to that comment about "atoms", light isn't waves or particles - rather it's simply that with one experimental arrangement we see one result (and the conceptual framework of "particles" is useful to capture it), with another arrangement we see another ("waves" is useful to capture it).
- Second, the idea that the observation "collapses the wavefunction", or similar, is already an assumption. No such collapse is ever observed; the concept is really just an artefact of attempting to assign an interpretation to a theory - really, a type of calculation - that was never built to be "understood" in that way. Wavefunction collapse, and therefore the idea that "human conscious awareness" is linked to something, is effectively a ghost!

Instead, we might be better to note: what exactly do we actually experience? In what way do we experience "human consciousness". I'd suggest that, in a very real way, we don't. Not as a thing, not as an object. Go looking for "human consciousness" in your actual experience right now. Can you find it? This is the starting point, I think, and it re-contextualises quite a lot of what we're talking about here. We cannot measure human conscious awareness "physically" because it is not a thing - and also the term "physically" refers to a concept which is part of a particular description of a certain idea of a world, and we are dealing with something "before" such descriptions. Which leads us nicely to:

Jumping, Self, Maps, Truth

And in the realm of dimensional jumping, it is not the self that shifts...

Or it is only the self which shifts. This of course depends on what we mean by "the self".

And sure, we are all one, in the words of the mystics - but for the purposes of this realm, we are evidently not.

It depends on what was mean by "we are one". I'll bet your actual experience right now is not divided up into "parts", for example. The only "parts" are in your description of, your story about, what you are experiencing. The mystics might not have been talking about "being one" in the sense of a place with objects that are all undivided. Rather, it is that you-as-awareness are undivided and "takes on the shape of" states and experiences. In other words, you are a not a person-object located within a world-place; you are a sort of non-material "material" whose only inherent property is being-aware and which adopts states. That is the "self" that shifts, and it is all there is. It is, however, not a personal self, and it is not an object, so there is neither "one self" nor "many selves".

[Robert Anton Wilson] The map isn't the territory, and the map may or may not be completely accurate.

We could even extend this, perhaps: The very idea that any map is of the same "format" as the territory is in error. And the idea that there is "territory" somehow independent of ongoing experience is also in error, because that notion is itself an example of the map-territory mistake. A map is another type of experience, and the "thinking about a the universe" experience is alongside the "apparently being a person in a world" experience, at the same "level", and never gets "behind" it.

In other words, the whole idea of "explaining" experience or the world in terms of parts and relationships is flawed. The patterns we generate for our descriptions may be useful, but they are not true. The world as we are exploring it here is not something to be worked out - remember, we are not trying to make calculations or model trajectories here - and we have to make a clearer distinction between the-world (really, the ongoing moment of unbroken experience*) and "the world" (a fiction to which various conceptual structures are attached) than those doing science to. Although, we would all be helped greatly if some vocal scientists did a bit more philosophy and so didn't take interpretations literally.

I don't get it, what are you exactly saying?

Well, that comment you're replying to is part of an extended thread. Which bit isn't clear, and I'll try to explain?

Or did you mean just, why the hash-result idea doesn't get you anywhere in terms of deciding whether you have successfully "jumped" or not?

Mainly, that's because it assumes some things about our ongoing experience of the world that are actually being tested by the exercise. The hash is no better than the header ID, which itself, if it changes, tells you only that you are having an experience of "the header seemingly changing". Anything beyond that is just a story about "worlds" or "dimensions" or "hashes". For example, you can't have one part of the story break integrity - "the hash has changed" - with the others assumed not to - "the hash still corresponds to underlying facts". You are using the target of the experiment as its own reference. All you really end up with is: you had an experience where content changed.

The whole explanation is very complicated, please explain it in simpler terms, but the most important thing I want to know, is this: could this hashing method work? and if not, then why?

It's more that doing it isn't meaningful. That if you accept "jumping" then you also lose the ability to rely on proxies for indicating change between "jumps". I'll reply later with a bare bones explanation.

POST: REQ: Triumphant George's bio

Most flattering! But I'm afraid that this subreddit doesn't encourage AMA type posts. ;-)

More seriously, some background: Although I moderate here, really I'm just a contributor who occasionally helps out with some tidying up; the subreddit pre-dates my involvement. The Two Glasses exercise was originally a response to a "can we generate glitches deliberately?" thread on the Glitch subreddit, and the exercise was based on the "patterning" model I first outlined in simplified form at another subreddit (links are in the intro post). And the real purpose of all of that was to encourage people to identify hidden (and incorrect) assumptions by generating thought-provoking experiences that contradicted them. Now, some might call those experiences "results", but in the longer term the point is to go beyond that and change one's perspective on "the nature of experiencing" at a basic level. Hence, this subreddit tries to encourage thinking about the implications, what they mean for the "formatting" as well as the content of our experiences, as much as obtaining outcomes - all the while not really pushing a particular view on things one way or the other. Everyone has to check it out for themselves (for quite fundamental reasons which become clear later). We're not trying to convince anyone of anything here; it's a shared adventure. ;-)

Having said that, who knows? Perhaps with the search function, you still might be able to find something...

POST: [AMA Request] TriumphantGeorge

Ha, well that's very flattering! And yeah, it does seem that if I have a spare moment and there's a keyboard in the room, something "happens". I won't do a general AMA - because I'm not here as a 'person', I'm just contributing to the exploring and experimenting, and of course I'm not the originator here - but those questions are good jumping off points (excuse pun) for group discussion, so I'll pop back when I get a moment and reply properly.

EDIT: This will be tomorrow.

Q1: This may sound extremely odd (to put it mildly ;)), but I was just finishing some work related to a course that I'm taking on Udemy, and I found myself thinking about how incredibly amazing it would be for someone to create and post a course [on Udemy, or on any other online learning site] about dimensional jumping...
...and, since you've shown yourself to be quite the expert on this subject, I couldn't help but also think of you and your highly informative posts. I know that you must be extraordinarily busy, but do you think you might ever consider doing such a thing, at some point in time?
(Currently, people have posted courses that involve subjects like clairvoyance, dowsing, remote viewing, telekinesis, energy healing, and lucid dreaming, so a course that

covers the topic of dimensional jumping -- including, perhaps, the ideas, theories, techniques, and pertinent background information related to it -- would seem to fit in quite well, and appeal to many people.)
I do apologize for asking such a strange question, though, and I hope you don't mind. :)

Interesting! Well, it's not such a bad idea for something in the future. The overall subject (applied metaphors, the nature of experience, etc) can be hard to convey in language alone - and a visual aspect can definitely help. It's something I played with briefly when describing the Infinite Grid concept. The idea of giving the viewer some sort of version of the experience is quite appealing. I'll keep the notion in the back of my mind!

Q1: Thank you so very much for your response! I know that it must have seemed like a rather peculiar question to ask, so I really appreciate that you took the time to answer. :)

Not peculiar - you thought of something that you think would be good, and you asked about it! Seems like a sensible approach to me!

...

[Going to take each of these separately, posting the responses whenever I get time. This will make it easier to follow any discussion anyway.]

1) I see you are also a moderator of Oneirosophy and Glitch In The Matrix. What sparked your interest in dreams, reality and consciousness?

When I was studying at school I decided to look up memory techniques. In the library I found books by Tony Buzan and Edward de Bono about memory and creativity, but also an old book about “journeys into consciousness” in which a group of psychologists did basically the doors to the mind ritual, and Oliver Fox’s book on astral projection. There was also a de Bono book called The Mechanism of Mind[1] which got me thinking about generalised pattern formation. So these, combined with my interests in physics and art, kind of dictated my direction from then on.[2]

In terms of those subreddits, I never really aimed to get involved (the reason I ended up here is because the approach seemed “undirected” and I figured few concepts might help people avoid discomfort). I just found myself contributing too regularly. ;-) But it’s interesting that they do cover what I see as the three aspects of this area:

- /r/Glitch_in_the_Matrix collects anecdotes about subjective experience and how it differs from our expectations and assumptions of how everyday-mode reality works, our “objective” notions of the universe. Reports of the spontaneous behaviour of the subjective experience.
- /r/Oneirosophy explores the metaphysics of the subjective experience, hammering out the perspective in detail by furthering the language and playing with different concepts. Metaphors to help us better describe the subjective experience.
- /r/DimensionalJumping is about directly experimenting with the subjective experience. The application of those metaphors to deliberately influence the behaviour of the subjective experience.

So: observation > metaphor > application

If there’s a “project” here, then it’s the project to bring knowledge that has become clouded by years of language abuse, strip it right down to the basics, and make it accessible - all based on the key insight that metaphors (“patterned thought”) shape experience, and experience is metaphorical.

Notes

[1] The book The Mechanism of Mind is out of print now although there's a copy on Scribd. There is a copy of the Oliver Fox book there too.

[2] Another book that was very useful was David Fontana's The Meditator's Handbook. It has a nice section on visualisation which concludes that (as we all know) the way to do it is to "allow it to happen". I thought it was out of print but there is a version available. Look up chapter 7 in the preview here [missing].

2) You have many great posts, would it be possible to somehow index them all so we could easily read through them?

Eventually it would be nice to gather all our insights and organise them in the wiki, but it’s a bit early for that probably. And it’s not a small task: these things need edited into some sort of shape so that they aren’t confusing and conflicting. And maybe separated out into metaphors, exercises, perspectives, etc. One idea would be to at least have a couple of pages for now: one for recommended reading material, and another an index for the main posts. That way, the information-based posts wouldn’t be so vulnerable to getting lost in the stream, obscured by our general questions and chat. And it would allow there to be a “read this first” list so that newcomers don’t have to ask the same stuff.

It’s tempting to think an FAQ would be a good move, but I feel the nature of this stuff is such that there’s no definitive worldview to offer. Rather, there are lots of different, equally valid, ways to describe and apply what amounts to the same “ineffable” knowledge. Maybe a page indicating “what your mindset should be” might be appropriate though.

3) What changes have you seen in your life when putting to practice your techniques, methods and philosophy?

Probably the best way to answer this is to discuss the underlying motivation, even though it might not have seemed this way to me at the time.

Unwitting Deformation

One of the reasons I think I was driven to investigate this, apart from just curiosity about the nature of things, was because I struggled with certain aspects of living sometimes. I would vary between being relaxed and spontaneous, and at other times not ‘getting’ what was going on, accumulating tension without realising it, and so on. Everyone has elements of this, but it was annoying to be alternately relaxed and present, then useless and unaware. Why was this? It wasn't obvious that I was actively doing something particularly wrong. The reason turned out to be: attention and control. By having the wrong concept of the structure of my experience, but being keen to perform, I was directing my experience incorrectly and so constantly deforming my perceptual space. I'd be open and spontaneous and then narrowly located and locked-in, all by trying to “do” things via action. And because attention is 'invisible', it really corresponds to a shaping of perception, it's difficult to realise what is happening. You are changing your own shape without realising it.

Detaching & Triggering

So the major change is actually simple and everyday: my ongoing experience is more “open and spacious”, and movement and thought don’t involve effort and strain. You realise you have experiences of moving and thinking; you don’t do moving and thinking, and so your point of interaction alters. The next major change is that, having realised you “insert experience” into the world, or activate patterns, you change your approach to getting what you want. If world is a single pattern coherent and you acquire experiences by “inserting a new future frame into the film” or “activating a pattern so that it later appears in sensory space”, then what use is thrashing about it trying to make things happen by constant fiddling? I used to do that, and it made for a very rollercoaster life. So, additional actions here don’t produce results there. Instead, your job becomes to occasionally assert things and otherwise allow experience to flow, knowing that the flow now has your desires incorporated into it. This flowing includes allowing body and thoughts to move of course - being, as they are, just parts of the extended world-pattern, and an aspect of your experience.

The short answer is: "Adopting new metaphors for more fun and less fight"

4) Have you got any tips for a beginner such as myself to start seeing real, positive changes in my life?

Okay, I’m just going to throw out some random ideas here and maybe something will be useful. For general things:

- **Daily Releasing Exercise** - I’ve mentioned this before but I think the single most important thing is to allow your attentional focus to relax out. So do a daily releasing exercise where, for 10 minute maybe twice a day, you lie on the floor (feet flat, knees up, couple of book supporting the head) and “play dead”. Give up completely - to gravity, surrender to God, abandon yourself to open space, whatever. Allow your body and mind and attentional focus to move and shift as it wants. Think of it as allowing your nervous system, or your perceptual space, time to unwind and cool down. The trick is that releasing of attentional focus. If you notice yourself fixed on something, just release again.

- **Be The Background Space** - When you have spare moments, close your eyes and “feel out” with your mind, go looking for the background space in which all experience arises. Feel yourself to be that peaceful aware background and stretches out forever. When going about your day, switch your perspective to being that background. Since the space goes on forever, you can realise that there is nothing beyond that. There is no world outside that is “happening” while you’re not looking at it. All there is, is the immersive “world-thought” that is appearing in your mind right now.

An expanded version of the above ideas can be found in Overwriting Yourself.

- **Fun With Imagination** - You should always treat imagining as if it is a direct interaction with your private world. You are literally adjusting the relative strengths of various patterns by doing it. You don’t need to worry about passing thoughts; they’re just telling you the relative states of the world-pattern as it is. However, you should only deliberately imagine/say things which you would be happy making a more dominant contribution to your ongoing experience. This shouldn’t be seen as a task though - it’s fun to imagine things you’d like to happen, to make vivid your desires! Do so regularly for both what you’d like to happen and also to revise previous experiences into the desired version.

The last bunch of posts, including All Thoughts Are Facts and The Imagination Room, expand on this.

Meanwhile, for general body and mind use without too much esoteric flavour, I really recommend this book by Missy Vineyard. It’s based around the Alexander Technique (an approach to body movement) but she inadvertently goes further than this and gets the whole expansion of spatial awareness / non-doing flow and intention thing down pat. For other stuff, you just have to experiment. Play with the idea that the world you see around you is an immersive 3D sensory thought, and that you could “declare” that is going to happen, assert new facts, or assign properties and meanings to objects and events. Mostly, try to view it as a 3D pattern which has no depth - in other words there is no deeper world behind it, supporting it.

The What's it all about? post was an attempt to get some of the background perspective down, with relevant reading material so that people can form their own ideas.

5) What is the best book you've ever read and why?

I really can't think of an answer to this one! In terms of non-fiction for this the subreddit's topic, everything you read just becomes an interconnected web of different ideas here and there which eventually form into your own blended understanding, so I can't think of anything specific. My favourite fiction authors are probably Philip K Dick (for the concepts rather than the writing quality) and JG Ballard (exploration of society). Today, anyway.

...

Insanity and Functionality

Any fear of becoming completely unhinged or insane?

My thinking has been: If experiences are just that, it pays to not take them too seriously. People can get obsessed with certain notions and their experience reflects that back at them as the patterns become more established. There's only one thing to realise, and that's the relationship between consciousness and world in subjective experience. People messing around with magick and psychology often create unfortunate experiences for themselves, and then by viewing them as external make them behave "as if" they were external. I've always been super-cautious of that sort of thing, and indeed any content. The world may be an illusion, but it's an illusion in the sense that it's not a "spatially-extended place unfolding in time"; it is still your experience regardless. I think an understanding of experiential reality as being "super-basic" - by which I mean that it's the activation of patterns in a 3D space - helps avoid delusion and maintain perspective, since it brings you back to experience, now without interpreting things as external forces or understandings. Of course, this doesn't mean that you have a great explanation for the patterns you experience in terms of "the narrative" of the content - but it does mean you're clearer about their nature.

World-Sharing and The Objective

Also, do you have any advice for people struggling with the idea of an objective or consensus reality?

Well, it's just an idea isn't it? It's a trick of language more than anything. The "sharing-model" of the world is one of the most challenging things to think about - and that's because it's inaccessible, it in effect doesn't exist, and by its nature it would be "before time and space" and therefore literally unthinkable. Which is why recent philosophy and physics efforts are often tending towards the "private view" notion (see P2P and QBism) with a handwaving promise to hopefully fill in the blanks on the objective (the nature of "world-sharing") later. For a convenient working model, it's handy to think of it as private copies of the world, built from a shared toy box of all possible patterns (objects, relationships). In stead of the world being a shared environment, it becomes a shared resource. In this view, "people" are patterns too just like any other object - collections of possible perceptions of a certain related form. This includes "you" as well; it's just that your experience has taken on the perspective viewpoint of this particular "person". You might think of people's full pattern of possible representations as them being "Extended Persons", of which you see a particular aspect at any moment.

...

Hey, thanks for that.

Do you know if there were/are any other schools or thought...

I actually think most "religious" traditions have their seeds in this sort of worldview, even if the organised versions of the religion lost touch with, or intentionally corrupted, that knowledge. Christianity itself seems to be rooted in these views, with the Bible's parables being metaphors-for-metaphors, and instructional manual for understanding reality and creating change. Over time, though, all groups seem to lose their way as the message is diluted, misunderstood, or suppressed. And I guess various magickal groups also fall into this category of "communities bound by worldview with the purpose of making change"?

I read a book called the Fifth Agreement: A Practical Guide to Self Mastery...

I'm not very aware of Toltec, although I've read Carlos Castaneda's books and they seemingly have some relation to it. Browsing the wiki page it's pretty interesting how their recorded history seems to be myth and metaphor, much to the pain of archeologists and historians who want the "real" story. But of course, the myth is the real story. (See: Toltecs as myth.)

Reading through the "agreements", they would seem to be on the core idea:

Maintaining purity of observation.

Which is a pretty decent approach I'd say. Although without an underlying metaphysics to ground it I wonder how much benefit it brings (perhaps the books explain more?). The All Thoughts Are Facts post is pretty much a description of maintaining a world by realigning "inner" observations appropriately.

I thought The Art of Dreaming was pretty interesting, it had good quotes on will and intention; I don't really remember much about the rest of the books though. Yeah, it's more of a meandering narrative than a direct discussion of a worldview though. Neville Goddard is quite interesting on the "taking the bible as instruction manual" view, but it crops up in different ways quite a few places.

POST: TriumphantGeorge - do you jump?

he says he "isn't here as a person"

Heh, well, I think when I said that, I meant it in the sense of my activities as a moderator and as a contributor to the subreddit aren't about me as a person; they're about facilitating exploration of the topic. Which, in turn, is about everyone examining their own experience and experimentation, without believing or following anyone else. On the other hand, the underlying idea of the subreddit is to explore the "nature of experience" and the "nature of descriptions", and one of the conclusions we draw is that we aren't

a "person" as such, and we view our stories differently. In particular, a distinction is made between the content of experience versus the context, etc. Lots of comments going into that elsewhere, of course, so I won't repeat it here. It's not really mysterious, except in the literal sense of "mystery": a truth that one can know only by revelation (experience!) and cannot fully understand (describe!) in conceptual terms.

He's so enigmatic, almost overly so.

Ha. That has probably got more to do with my excessively comma-and-quote-heavy circular writing style, and my terrible habit of not doing enough proof-reading, rather than anything exotic!

So you are saying you did not 'transcend the human experience'? :-D

Heheh! I'm not particularly sure what they mean, to be honest. If you consider, say, playing with adopting being a "space within which a scene arises" - or more dramatically if you have a "void experience" [http://www.nderf.org/Experiences/1victor_c_other.html], or even just do the Feeling Out exercise to attend to your direct experience as it is. Then, I dunno, the "human experience" seems more like a thought about experience than something you ever really have, as such. At least, unless it is defined far more strictly. Like a lot of questions relating to this topic, it perhaps ends up falling into the "actually, the answer is that the question does not really apply" bucket. A bit like asking about the "other you" after a "jump".

I'd like to know if you had one (or more) of the spiritual (salvation history related) experiences described by Neville Goddard in his books. You know, meeting David, or holding the child wrapped in swaddling clothes, Kundalini rising etc.

No, none of those sorts of things. Plenty of symbolic lucid dreams and occasional waking life encounters with interesting people, but nothing overtly "standard" in terms of symbols. I don't have a religious background at all, though, and so those representations don't (or did not) have that meaning for me. And "meaning" is, I think, the driver for a lot of the content we experience.

POST: This shit actually works

Its just the vocabulary some people use to describe this experience.

True enough. The potential issue with it, though, is that it can be unintentionally misleading, since it implies there is an external agent involved in this. While lots of people say things like "signs from the universe" as just a fun turn of phrase, our language has a tendency to imply an active causal entity behind things (because it forces things to be described in terms of "parts" with one affecting the other). Unexamined, this can lead to some confusion. That is, we can end up treating "the universe" is a separate actual thing - to be appeased, convinced, negotiated or communicated with, and so on - rather than a concept which acts as a placeholder for "the current patterned state of everything" or similar. This results in the endless questions that crop up which are based on the idea of some sort of independent intelligence or mechanism that must be negotiate with, and ever more convoluted descriptive schemes to account for this never-really-experienced entity. So, it's probably worth clarifying these things periodically, to save people going on self-perpetuating wild goose chases, even though to many it's just obvious what is meant. Particularly because pursuing this in terms of such a view can generate "as if" experiences, the patterns of which become more and more pronounced, but ultimately distract from what is actually going on at a "meta" level.

It doesn't even need to happen on an Inner-world/Outer-world level, it can simply be in an internal dialogue.

Indeed. Ultimately, though, we don't even need an inner dialogue, because such dialogue is itself an intentional result - a piece of "sensory theatre". Intention itself has no particular experience associated with it, unless the intention (the pattern/fact being brought into play) has a sensory aspect within the current moment. And of course, nobody ever actually experienced an inner-world/outer-world anyway, although they may occasionally have had thoughts about such things: If the world is a patterning of you-as-experiencer (there is no "you" as such at all really other than the occasional thought about it) then simply asserting the fact that something is true is all that is needed. And really, that's all one ever actually does in any case: all apparent acts resolve to this. It's not even an act! It's a self-shaping. Non-verbally (since the assertion isn't a localised object, it literally is the outcome pattern, being "intensified") we might consider its essential form to be "it is true now that this happens then". (Better yet, replace "happens" with "is experienced".)

The whole idea of "delegation", then, is itself part of an intentional pattern. This is because an intentional pattern is not a "doing", it is "what is being brought into prominence" and that includes any apparent "causation" aspect. Of course, in terms of getting a specific result - if one is pursuing techniques - then there's a bit of "anything goes" about this! However, for the other part (the other focus of the subreddit) we don't just stop at "useful" and we dig a little deeper, even though initially that can seem pedantic and like empty wordplay. But eventually this bears fruit, I think, because that's how we're freed from the assumption that there is any particular mechanism or technique (they themselves are directly or implicitly aspects of an intention; there is no fundamental "how things work" involved), or that a "you-object" that is operating upon a separate "world-object" (any apparent experience of that is, again, an intentional result: a piece of "sensory theatre" and/or just a thought about "what is happening").

a technique such as Delegation is very useful for complex Intending if one wishes to continue as Person.

I would say, though, that one never is a person anyway. Although one can structure an intention using the formulation of "a person doing this", it never actually is that. The intention is always a shifting of you-as-experiencer rather than the (fictional) you-as-person. Basically, I don't think there is any essential difference between intending "it is true that the universe is going to obtain this-result on my behalf" versus "it is true that this-result will occur". However, it can be fun to pretend, to intend "as if" this or that were true. Really - this may be where you are coming from overall, especially with your next statement - we always do that to some extent. Even the idea of "making something true" is essentially an "as if" approach, of course. The only thing that is fundamentally true is the fact of the property being-aware; everything else is relatively true only. (And it is impossible to pack that into concepts, because it is "before" objects and relationships.)

I think calling a conceptual framework "useful" already implies certain things about How Things Are(n't).

Of course: it (re-)implies the idea of being in a situation, the possibility of another situation, and that there is a sense of purpose involved in translating between them, plus the very idea of such a translation. But: I think, though, here we've been making a distinction here between "getting results" (that is, targeting certain experiential content) and "knowing the nature of things" (that is, recognising the context of all experiences). So long as we don't mix up one with the other, it's okay if things are being implied. When we're focused on "getting results", we're fully embracing those implications. We're okay with "useful" not being fundamental. We are, after all, not in a "void" state: we start this investigation with a certain patterning already in place. So we leverage it. When we're focused on "the nature of experiences", we again accept our current patterning as a starting point, but now we expand our approach to include that starting point also.

POST: Jumped and now seeing things

In the spirit of pushing back on unexamined assumptions, I'm duty bound to interject just to say that this is not really an "asking the universe" or "connecting" type of deal, by design. Although one can certainly conceive of it as such and have experiences "as if" that is the case - if one intends in terms of those perspectives - the two glasses exercise is actually specifically structured in a much more direct way. There is deliberately no suggestion of an intermediary, or indeed any mechanism or process at all. Ultimately, the results might (should?) lead one to reconsider notions of what "you" and "the world" are, and what the relationship between them is - if any. This usually happens in a way that allows us to recognise that there is no "request/entity" structure, or even "you/world" structure, fundamentally.

See this previous thread, for example [POST: This shit actually works].

I think that the main issue with "universe", as it's commonly used anyway, is that it implies a separation between "you" and "world", as you suggest. But even when that is resolved, it still tends to be interpreted as indicated that the world is a sort of extended "place" with you as an object in it, albeit an object not inherently divided from that world. Specifically tackling that notion is what can give us a more intuitive, and direct, understanding or experience of what is meant by "oneness" and "intention". Yeah, it's always worth chipping away at what is meant by words, to reveal any hidden assumptions. In particular: assumptions that only one side of the discussion might hold, as with the meaning of "universe". It can come over as pedantic initially, but it's actually the things we haven't noticed about our thinking that make us stumble, like that, so that's where progress is made.

POST: Correlation Between Beliefs/Perception and Experience?

One issue is that people tend to mean different things by "beliefs" - so it's worth considering what exactly they are, in the sense of their form of existence, and how it is expected that they have a causal role. I suggest that if what is meant is roughly "stuff that I think is true when I think about something", then they are not particularly causal. If what is meant is something more like "the relative facts contained within my state", then maybe. The problem here is that when you dig into the nature of experience, the perspective on these things tends to shift such that the original meaning of "belief" might not really be coherent anymore. However: I'd say that where "belief" comes in is that if you believe something (in the sense of feeling that "it is the case" when you ponder it), then you are less likely to relentlessly tinker with things and second-guess yourself. It's in that way that it corresponds to "detachment". Which is really to say, not constantly re-intending or counter-intending something you've already asserted. The final instruction in the Two Glasses is, "just carry on with your life". Which is a (deliberately indirect) way of saying, it is already done so leave it be. The change occurred at the moment of the exercise, and so "it is true now that this happened then", with all subsequent moments being defined by that intention. All subsequent moments are a result of the intention, aspects of a state which now incorporates your outcome.

If you "believe" that or at least don't bother about it, then those moments will arise spontaneously (including moments of you apparently doing things, etc) and eventually you'll encounter the moment which contains your outcome. If on the other hand you have doubts and fiddle - doing additional intentions to try and "make" it happen, or spend time deeply concentrating on the possibilities of it not happening - then you are effectively doing a new intention, or at least a counter-patterning, thus shifting your state again. Note that we aren't talking about passing thoughts here and occasional loss of confidence, but about getting focused, deliberately or not, upon counter-patterns. The important bit is, though: Those subsequent moments might contain feelings of doubt or even unpleasant events.

If you resist those feelings and events or try to manipulate them away, then you are intentionally shifting state again, possibly to one that no longer contains your outcome. (Although I'd say that it's probably quite forgiving if you have a successful intention, unless you resist things like spontaneous physical acts that you are "meant" to perform.)

Another consideration is that when performing intentional acts, we tend to imply the extended pattern associated with that act, which gives the idea of the act meaning. So if you react (which is intentional/resistant, rather than respond, which is spontaneous) to something in terms of an expectation associated with your old situation, you are in effect strengthening that pattern again, to some extent anyway. Ultimately, then, the answer is perhaps: forget about beliefs, because the concept isn't that meaningful in the end, and also the course of action would be to do nothing about them and just treat ongoing experience as a "dumb patterning system" which you interact with in a direct fashion (that is, you are shifting yourself in order to adopt a new state; there are no intermediary mechanisms or entities involved).

...had waned in the past few hours and I thought I'd f'd up.

Yeah, I understand the concern! But, no. I think it's fairly ridiculous to expect some sort of permanent joyous experience [as a sign of success or as an ultimate ambition]; that's not the promise that is made. In truth, no promise is made, really. What you do get is, to notice the fact that - loosely speaking - what you truly are is "awareness" which is "patterned" into an experiential state, from which all moments follow. And so, subject to one's own experimentation, what you have is the possibility that you can re-pattern yourself.

From this, if you were to insert a particular fact into your state - a future event, say, such that it is "true now that this happens then" - then the only guaranteed thing is that fact. The rest of your state will have accommodated that fact such that the moments from now to then are continuous, but besides that there is no guarantee regards the content of your experience. Your assumptions about what "should" happen between now and then are irrelevant; they're just little ideas you are thinking, nothing more. You might even feel massively depressed for weeks until, one day, some event happens which completely transforms your viewpoint, and then your intention seems to come to pass, as if the event caused it. However, actually the entire sequence of moments was the result of the intention, not just the moment of that event. The intention was the cause of the whole thing, not the event.

This doesn't mean you have to simply accept feeling crappy, of course! You can intend adjustments or whatever. The point is, though, that the idea that you have to constantly control every moment in order to maintain yourself and get an outcome, is flawed. That view assumes your are like a boat sailing on choppy waters heading for an island, and you have to keep re-asserting your course. Really, though, you are the boat and the waters and the island, and your (accumulated) intention defines all three. Now, for sure, if you find you have intended against your outcome, then it's fine to re-assert it. But it shouldn't be viewed as an ongoing battle against the psychological weather; the passing waves and winds are actually part of the course you have implicitly defined for yourself.

I've read through your reply a few times to try and fully get it

The final paragraph is meant to suggest that whatever feelings that arise within you don't indicate that an intention has "worked" or "not worked". When you intend something, it's like you've inserted a fact into the world directly - and the "world-pattern" shifts at that moment to incorporate it. That insertion is the only thing that ever really "happens"; everything else, all feelings or whatever, are you experiencing the resulting state. As I said, though, you don't need to simply accept feeling crappy. As a separate item, you could address that. You might like to play with the exercises in The Michael Chekhov Handbook: For The Actor (Chapter 4) for this. You'll probably note the connection between the perspective adopted for those exercises, and the expanded viewpoint implied by, say, the Feeling Out Exercise in the link at the end of this comment. The focus being: experiencing and the "directness" of it.

At the back of this, really, is a reappraisal of what you consider to be "you" and what you consider to be "the world". For some previous discussion on this, see the exercise in this comment [POST: In what way are other people real?] and the metaphors in this comment [POST: [THEORY] The Nature of Consciousness].

A couple of quick comments for now [actually they weren't quick after all]:

But these "feelings" you get after intending something are a lot different from wandering thoughts and ideas about the intention.

The wandering thoughts, emotions and so on are pretty much what I'm referring to here, because that seemed to be what OP was talking about rather than a direct apprehension. The "deep intuitive feeling" - what I've tended to call things like the felt-sense rather than "feeling" to try and make them distinct - is something else. That is different to "feeling bad about things", including having passing bad emotional thoughts and feelings (thought which are just feelings, for example) about the situation. There's a difficult-to-articulate difference between a sense "about" the situation and a sense "of" the situation, too.

[When you intend something, it's like you've inserted a fact into the world directly...] I cannot agree that it's as simple as inserting a fact into the future and having it happen.

Perhaps I should rephrase this as: When you successfully intend something then that is identical with inserting a fact into the world directly. It is as simple as that, but only if that is what you do. If you do something else instead, then you don't get that outcome. If you don't intend the actual pattern but something else, or if you subsequently counter-intend, then you've not actually intended the update. If you want to draw a shape on a piece of paper, you have to actually draw the shape you want - and not another shape, or a drawing about the shape, or a drawing of drawing a shape - and then not subsequently draw on top of it. Intention is "direct" in that sense; there is no interpretation for you, and no gap (although there are additional concerns such as what is being brought in by association or whatever). If you don't get an outcome, then it's because you were doing something else instead. Working out what that something else is or was, is part of the experiment and fun.

You have to be willing to give up your life, your personality, your goals, everything you have in order to detach.

A brief way to say this is perhaps: you want to simply "cease" to intend in reaction to moments which appear, and only intend for occasional updates. So your default is to "be okay with whatever happens" (including things like your body positioning and movements; it's not just the big things) which is identical to simply leaving one's state alone between shifts. But there's some granularity to this. While our state is a single unbroken pattern, and so we might say that all intentional change is a change of everything to an extent, including reactive intention - it's not the case that one has to let go completely of everything, and always, to get any outcome incorporated into oneself. (But one has to not be stepping on the rug that one is trying to move, at the moment of movement.)

The Two Glasses exercise is really intended as something of a demonstration of that, and a starting point for exploration (which is why it and the Owls exercise are referred to as "demo exercises" of course). As one experiments more, then subtleties are noticed, but I think you really have to actually conduct the exploration, essentially of the condition of your own patterned state, to get further. Because lots of descriptions - involving "detachment" - don't make much sense until you do. Things that seem like they will an "action" involving "objects" upon reading, turn out not to be that in experience. I think that often ideas like "detachment" tend to suggest to people something that

they have to do. And so they try to find the best way, method, technique, and understanding that will lead them to this. But, and the same applies to the idea of "intention" itself, that can become part of the problem. How can you detach when you aren't really attached to anything (because you aren't separate from anything)? How can you intend when there is no separation between you, the intention, and the thing being manipulated (and not even a "you" as such)?

So I agree with you in much of what you say, but I'm inclined to think those issues are sort of collateral ones, that it doesn't necessarily pay to try to address directly, because to some extent they turn out to be mirages later. Perhaps similar to saying (reasonably) that to move one's arm efficiently what you want to do is both relax and move at the same time - but when you get to grips with that through experience, it turns out to be more like a direct unbroken shifting of the whole rather than two acts on an part of the body. The description only makes sense from that perspective, afterwards, because only then does it gain meaning - and it can actually get in the way beforehand. And so, perhaps, with advocating "detachment" as an aim to work towards, rather than something which comes from, is a way of trying to describe, a more direct understanding after the fact.

We're mostly on the same page here (half the discussions on this topic are basically working out that people agree, just in different words, it sometimes seems!), except for the last section. Again, though, this might be somewhat a matter of terminology and perspective.

I suppose when I say detachment, I'm talking about a state of nothingness, a void. Technically we shouldn't need to detach from anything because there is no separation.

That's an indication that "detachment" invokes a mental image which is unhelpful, I think. It suggest something spatial, to do with contact, and that is misleading (another reason I'm not sure it's a helpful term except as a shorthand in retrospect).

It is like a blank slate. This is the state that monks are aiming for. This is the state that people often call "enlightenment".

"Enlightenment" is such a misused and mistranslated word, I'd say. For me: I would not say the void state, or the adoption of the void state, is equivalent to "enlightenment". It is another experience just like any other. There is generally a sense of "having-being an experience" even though it is not spatially or temporally structured; it is not entirely blank. That is possible too, but not completely, because otherwise you'd not come back from it. So, we should probably distinguish between a "void experience" and a "void state". The ultimate void "state" would be one where the particular distribution of relative "intensities of contribution" of all patterns would be completely flat, near-zero contributions. There would be no re-remembering a world experience afterwards. Here, then, we are talking about a "void experience".

The sense in which that is associated with "enlightenment", is that having such an experience can tip you off that the only thing is fundamentally true is being-aware or "awareness" - because you have experienced everything other than the pattern of being-observing, all object content, disappear. But the actual experience is not special in some sort of hierarchy. It is only special in that it might nudge some insight. But you can have that insight right now, simply by attending to your present experience and realising that you are "everywhere but nowhere" within it (and that what you think of as "you" is just the perspective-structuring of the moment) and it is all "made from you", thereby recognising that all boundaries are "imaginings of boundaries". That recognition is enlightenment, I would say. Which is why it is such a problem to articulate: it is not content-based and it can't be described, since it is "before" division and multiplicity and objects, and conceptualisation and language depend upon dividing things into parts and then re-relating them in a metaphorical mental space.

Looping back:

If someone wants to get real, meaningful, consistent change with their jumps, they have to detach until they reach this state of nothingness.

Your other point does still stand, though I wouldn't describe it that way. That is, that if you "cease" reacting and maintaining completely, the experience of doing (not doing!) that can be like becoming a void - then you are no longer preventing a shift simply by having held content. When in this position there is (almost) no opposition to intention since there is no conflict between the patterns corresponding to the content of the moment and the pattern you want to bring into prominence (because you have a void moment). But you don't need to do that. That's like deleting your whole street temporarily in order to reposition your sofa. You only need to avoid holding onto a pattern which conflict with the intentional pattern. Just like when you move you arm, you don't need to go all floppy or lie down first - you simply intend arm movement without also intending or implying anything counter to arm movement.

Aside - It is genuinely instructive, for those who haven't done so, to experiment with effortless intentional movement. After all, there is essentially no difference between modifying "the fact of my arm's position" and any other fact; but feedback is instant and within one's perspective.

That's why the results on this sub are usually 'tame' or rather inconsistent. Someone may do two glasses. And it works with amazing results. But when they try to replicate it or do something bigger, it fails.

That's really because it is not intended for that; it's a demonstration of a very particular thing. The two exercises (Owls and Glasses) demonstrate two specific aspects of experience - although ultimately they are the same thing of course. Owls is demonstration of direct re-shaping via intention; Glasses is a demonstration of indirect re-shaping via implication.

One of the benefits of the Glasses is that it reminds us that this experience right now is a pre-patterned image; it uses patterns of meaning already present to structure an intention, and it works even if you don't understand it conceptually. That's a valuable lesson in itself. But, inherently, it is not going to bring about discontinuities, because it is itself part of a continuous experience. Often I say that results will be in the form of events which are "plausible if seemingly very unlikely to have occurred". The Owls exercise is completely free from, and if you experiment with that, using different intentional patterns, there's much to learn about the "directness" of intention and experience. We move from abstract "owl" type patterns to more specific patterns involving spatial and temporal aspects, and then we realise that the visual (say) is an aspect of the pattern, and that you are operating with patterns directly. That helps us towards comprehending that "you are the whole scene" of your ongoing experience.

Anyway, I wrote out a bit more than was required there, just for the general benefit.

Full scale detachment is the only real way to make any use of DJ consistently and regularly.

Since "DJ" is not just about results - because there is an inherent problem with the overall concept of "results" I think - then I'd say that a full investigation of one's ongoing experience and patterning is the way to make full use of it. That is the way the exercises are set up: they are called "exercises" because they are no "methods" or "techniques"; the reason for this is that ultimately there is no "mechanism" or "how things work", and no "act" which can be formed upon the world. Unpicking that fully is the only real option eventually; everything else turns out to be just another pattern or experience which brings with it a new set of implications and hurdles, on an endless "seeker's journey". Of course, aiming for results is the perfect motivation for this! I'm not criticising that at all, just the notion that any particular piece of experiential content or conceptualisation or any apparent act is the "solution" if only we can find it. That's the idea that we should really want to take as step back from, and consider from a "meta" perspective.

I still quite like the term "imagine-that" from one of the sidebar posts - short for "imagine the fact of something being true" - as a handy term to encapsulate the nature of sensory experience and how it is shaped. If you were to, right now, "imagine-that" something in your current world experience was different, how would you go about it? Or more to the point: is there a "how to go about it"?

Q1: "DJ" is not just about results - because there is an inherent problem with the overall concept of "results" I think - then I'd say that a full investigation of one's ongoing experience and patterning is the way to make full use of it.

Since the meta-context is ultimately inaccessible and there is no "waking up" from the "dream", what is the purpose of this investigation if not to learn how to improve the content of our experience, getting the results we want?

There is no waking up in the sense of getting "outside" of experience, of course. However, there is a waking up to the fact of the dream, and the nature of the experience in terms of "you" and "the world" - and this changes the meaning of the content of your experience. Of course, we might say that this is a change in content too - but generally when people are talking about getting "results" they are talking about still having exactly the same structure of experience (apparently a person-object in a world-place) just with improved person-world circumstances. We can go further than this, though. And to not do so, when there is a possibility of digging further, is to remain wilfully ignorant, surely? It's good to be at least aware there is a choice, anyway. This change in meaning is the "meta" aspect, and is itself a change in circumstances, but not of the world.

It might be useful to distinguish, then, between the "formatting" of experience and the "sensory content" of experience. If someone is just seeking an improvement in circumstances, then they are just looking to change the "sensory content". But without pushing and investigating beyond the basic - potentially incorrect - assumptions (about the nature of experience and the nature of descriptions; our usual picture of the world; etc) and addressing the "formatting", any improvements are going to be pretty limited, I'd suggest. The underlying concept of this subreddit, ultimately, is based around an investigation via the quest for results, without necessarily making assumptions about how things are or what will be discovered. This makes it a little bit different from a "how to make my life better!" subreddit (see comment contrasting with others, here [POST: This sub feels like what /r/lawofattraction is trying to be], for example). If we judge our experiments by binary success or failure of outcomes, as if we were talking about a "method" or "technique" connected to a specific "mechanism" or "how things work", we're probably missing the true value of the whole endeavour.

We might also consider, too, what the value of getting "results" is, if they are in the end just a distraction, to pass the time as it were, until we die, in much the same overall state as we were when we began.

Q1: *be okay with whatever happens*

Doesn't this lead to a paradox?

When dealing with something really unpleasant, for example, should we be okay also with the fact of not being okay with that?

It's really meant in the sense of "do not resist the sensory moment that is arising". Because to do so is a counter-intention which, in any case, usually isn't properly directed at a considered outcome. It doesn't mean you have to like what comes up, nor that you can't choose to intend a change in your situation. So it's not "be okay" in the sense of "be happy with", it's more "be okay" in the sense of being okay with the fact of the experience as an experience, not react to it blindly. Other ways to describe the same idea may be more useful - for example, talking in terms of an open focus, etc. It depends on the context of the conversation really.

Q2: *That is all very interesting stuff, thanks for typing it all out; I will reread it several more times. Do you think there are any good ways of clarifying further for myself the reality of life? Sure I can read what other people say, but that is what a lot of people do in regards to spiritual teachers (parroting another person's words, when they aren't living from the truth) and if I feel as though I have to remember the truth from someone else' words, then I obviously haven't seen it clearly enough for myself. Sitting here, I can see that I am aware of a "person" typing on a screen, but I can't know if the website, computer, couch, family, etc. exist independently of my awareness. I've had derealization/depersonalization for several years, so things have already felt dream-like for a long time, but now my view has changed from "I feel so detached from the world, this is hell" to wondering if what I called the world was ever really there. I guess the uncertainty doesn't really lay with wondering if the world is real, but rather with how much influence I have over what I experience, which I suppose can only come with seeing how things play out for the next little while.*

Try the Feeling Out Exercise in one of those links, as a starting point! As you say, if you have to "remember" (conceptually reconstruct) other peoples words or ideas, then that's not really what you are after. Actually, you simply want to directly notice how things are. Something to keep in mind, though, is that the the truth is always true. There is no "higher" experience; all experiences are of the same nature. For example, the experience of "apparently being a person sat at a computer" and the experience of "apparently being an infinite void" are both equal, both made from "experiencing" or "awarness". It's recognising that - the sort of "meta" realisation about the content versus the context of experiences - that is what you are after. And so seeking a particular special experience, including the experience of thinking an insightful thought, is an error.

Your final sentence is spot on: The search for "what is true" is the search for "what never changes". This requires experimentation and attending to experience. I would suggest that the eventual conclusion is perhaps that the only thing that is fundamentally true is the fact of the property of being-aware (and so you conclude that what you are is "awareness"), with everything else (all content and patterning) being relatively true only. In other words, all experiences are on an "as if" basis only ("as if" something was true), and the only thing that is always true is that fact that there is an experience at all.

POST: [THEORY] The Nature of Consciousness

Nice and thought-provoking post. Some musings -

Firstly, how do we go about defining what exactly consciousness is?

I think it's perhaps useful to distinguish between "consciousness" (simply the property of awareness or being), "consciousness-of" (awareness, the context, taking on the shape of an experience, of content), and "self-consciousness" (the identification with a part of that content as "me"). In discussions, these often get muddled up, with people arguing about identification with a "me" as ("being conscious"), when really the core of it all is the fact of the property "awareness" (being-awareness). In that sense, then "awareness" isn't anything. That is, it is not an object, rather it is the subject to all experiential states. You can't define it as such, because it is "before" definitions - since definitions are based on the division of experience and the relation of one part to another. However, for convenience, we can talk of this property of awareness, so long as we recognise that the concept cannot capture it - since awareness cannot be thought about (it is that which thoughts are "made from") - and that there is no fundamental experience that corresponds to it (all experiences are it). In other words, there is no use looking for awareness within the content of experience, because it is "that which takes on the shape of experiences", including thoughts about experiences (which are themselves experiences: the experience of thinking about things).

Consciousness is, in simplest terms, the ability to recognize that you are a living being having an experience. The experience itself does not matter.

So this is almost it, except that "recognition" is an experience, and so it would fall into the category of content, of "consciousness-of" and maybe even "self-consciousness". But to some extent this is just an issue with words. To avoid the implication that there's an action, relation or a separation involved, we might rephrase as consciousness is the property of awareness or "knowingness" or "I am" or "experiencing" (as opposed to an experience).

This begs the question, though; where does your consciousness come from?

It doesn't come from anywhere, it is eternal (as in "before" or "outside" of time, rather than "forever"). It is not an object, and so it has no beginning nor end, nor any boundaries of any sort, nor any location (it is also "before" division and multiplicity). Basically, what it is, is "isness" - it is the fact or property of existence, without any existence itself as such.

If it arose only from the matter in this reality, how would it be possible to shift into a different frame of reference...

What we have to be careful of here, is the tendency to think about things in a 3rd-person "view from nowhere" that is never actually experienced. When we say "arose from matter in this reality", we are again imagining that consciousness is an "object" which can emerge or be created from something (has a beginning and end, and has boundaries and a location). As we've seen, though, this isn't the case. And what's more, that imagining (of consciousness being an object), is itself occurring within and as consciousness or awareness. I feel it's really important to keep coming back to your actual 1st-person experience (see this comment's exercise, for example), because that keeps you straight when you find yourself trying to think about consciousness. It's important to remind yourself that you are thinking in metaphors, and whereas with other areas a metaphor would exist as a "parallel construction in thought" at the same level as the thing you were describing, pointing to something alongside it, in this specific case the metaphor cannot do this, it points nowhere and everywhere - because we are talking about that which is the nature of the experience of metaphors themselves. The library is a nice metaphor for the "infinite gloop" of all possible patterns, eternally available in the background to be accessed, a subset of which are formatted into sensory experiences. If you haven't already, you should read The Library of Babel by Jorge Luis Borges. Several of his short essays and stories are metaphors for reality, experience and identity.

Other metaphors:

- **The Blanket:** What you truly are is the "non-material material" whose only inherent property is awareness or being-aware, and which "takes on the shape of" experiences. Right now, you-as-awareness have "taken on the shape of" the experience of apparently being-a-person-in-a-world. This can be conceived of as a non-dimensional blanket, within which there are folds (fact-patterns) which represent the world (world-pattern or current state).
- **The Beach:** The metaphor of the beach - about metaphors. It is not possible to build a sandcastle which captures within its form both "the beach" and "sand". However, the sandcastle is both the beach and sand. You can certainly label one part of the sandcastle "the beach" and another "sand", but the properties of those parts, being of form, will not capture the properties of the beach and sand themselves, which are "before" form. If you forget this, and start building ("thinking") further sandcastles based on those labelled parts, all further constructions and their conclusions are immediately "wrong", fundamentally, even though they may be coherent structures ("make sense") on their own terms.

- **Patterned States:** All possible patterns exist eternally with and as awareness, and all patterns always contribute to ongoing experience. However, they differ in their relative intensity, their relative level of contribution. Note that patterns are not located; they are unbounded and everywhere-nowhere, "dissolved" into awareness. The current experiential state, then, is equivalent to a particular distribution of pattern intensities, which you might think of as a set of "facts" which fully define a world or scenario (although those "facts" might be quite abstract, sort of meta-facts). One of those fact-patterns is that of "time passing". That is, a particular state fully defines a sequence of moments which unfold deterministically unless the state is shifted again. In order to shift one's state, one must change the relative intensity of patterns, which is done by intending. In this metaphor, "an intention" is a fact-pattern which is to have its relative contribution to experience increased, and "intending" is the intensification of that pattern. There is no method to intending, no mechanism or act involved, and no cause and effect. It is akin to shape-shifting. One simply "intends". Intending is the only cause; all apparent causes are in fact results of intending, in the form of patterns within a state.

And so on.

Is there only one consciousness... or are there many minds...

From the above, we see that this question is actually meaningless. Not in a dismissive way; this just follows from the nature of awareness not being an object. There are not "many awarenesses" and nor is there "an* awareness"; there is simply "awareness". The only fundamental fact, the only thing that is always true, is the fact of the property of being-aware. Absolutely everything else is relatively, temporarily, true only. This includes any apparent division or change in time. Again, we must constantly bring ourselves back to our 1st-person experience, because truly it is the only thing "happening" right now, and check the properties of awareness directly, noticing whether we are imagining a "view from nowhere", and where that imagining is taking place.

This question bothers me the most simply because it is the hardest to answer, as it would require looking beyond the metaphorical library.

Or, one flips things around? Instead of awareness being in the library, we have that the entire library is dissolved, eternally, within and as awareness - and awareness simply associatively traverses the content, unfolding different pages into the senses, as it were. The Infinite Grid, Hall of Records and Imagination Room metaphors linked in the sidebar try to indicate this shift in perspective (awareness as the context to all experiential content) too. The nature of awareness is such that it can't travel anywhere nor change in time, however it can select the content of its ongoing Now, by shape-shifting itself via its infinite potential, into any experience, "as if" this or that were true, even thought the only thing that is actually true is awareness itself.

Note: Don't make the mistake of then thinking that awareness "takes on the shape of" multiple people as beings, as if they were formed and arranged within some sort of place, who then go about doing things. You-as-awareness is the only being, the only intelligence. Everything else is patterns within awareness, which ripple across its metaphorical sensory screen, "as if" there were other people (and you-as-person) doing things. All that is actually happening, though, is awareness itself.

Short version: Consciousness doesn't have an inherent nature other than the property of "awareness" - and, as infinite potential, the ability to "take on the shape of" any other apparent nature.

...

Well, I probably do a "constructive rest position" lying down whenever I feel like it, a couple of times a day (lie down on the floor with feet flat and books supporting the head, let go of body and thought and also attentional focus, let things move as they will, 10 minutes). See also the Overwriting Yourself post linked in the introduction for some background. Mostly, though, it's just switching attention to an open state, and enjoying experience, whenever in the mood. I don't do a particular formal meditation or anything like that. And: yes, you should participate more often!

POST: I want a serious answer to what happens to other people after a "jump"

There are no "other people". In a sense, there is no you-as-person either, so there are no "people". There is just you-as-experiencer, having "taken on the shape of" an experience, "as if" you were a person-object in a world-place. Note, though, that you-as-experiencer is not a "thing" or an "object" or even a "perspective", which means there is not **an** experiencer, nor **many** experiencers. Really, there is just "experiencing". Another way to phrase this is that there is only you-as-awareness, or that the only fundamental truth is the fact of the property of "being-aware" or "awareness". Everything else is a relative, secondary, temporary truth only (hence we say we have an experience "as if" something is true). Although at first glance it might seem "ridiculous and morbid", that's usually because you are viewing it as a concept, which involves relating mental objects within a conceptual space. This is "before" that sort of division and explanation. Hence, the subreddit ends up being about exploring both the "nature of experiencing" and also the nature of descriptions. This - experiencing - cannot be conceptualised, because it is not made from "parts", and conceptual thinking is in fact an experience of or as it (metaphorically: "within" it, but it has no "outside" so that can be a bit misleading). It is not "morbid" because the "aliveness" of any experience is essentially sort of borrowed from this, directly, although it is not located anywhere. All of which is why the answers given to these sort of questions tend to be abstract, and irritating. (See also the metaphors given in the sidebar, as other ways into this.)

Q1: Well, you can frame anything any which way. But the reality is - and the one I hope everyone is working on - certain people experience sadness, pain, etc. and we feel sympathy with them, because they are the ones affected, not us. People can choose to cause this sadness and pain in others, or not choose that. That's how we judge someone's character. Emotions are real, and so is causing them, and separation from them.

Well, you can look at it that way if you want, for sure, but it's not especially supported by direct experience once you start attending to it and digging into things. Now, to be clear: it's not so much that I'm saying that "people" aren't "real" in any sense, but rather that the concept of "people" as commonly understood in the default view is incorrect. (Here, the default view being that you are a person-object in a world-place, where "the world" is assumed to be a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'".)

The outcome isn't that you perceive other people as just "stuff" to not care about - that "ridiculous and morbid" conclusion you refer to. Quite the opposite, in fact. All "people", including the apparent you-as-person, are structures within you. They are not "people" as in "separate beings", but it's actually more intimate than that: they are are all aspects of you-as-being or you-as-awareness (or "beingness", if you like). You might say (although again this can be slightly misleading), that the choice to "cause this sadness and pain in others" would be a choice to cause sadness and pain within yourself, even though you might not experience it in a direct "unpacked" form. You would still be modifying the world (as enfolded within "awareness") such that it was patterned with "sadness" and "pain" - and quite possibly in a way that would then later unfold within unpacked sensory experience, from the perspective of apparently being a person. It's not (intended to be) just "framing", this, I should stress. It is directly observable to be the case that you are not a person in the usual sense, and nor is "anyone else". It follows from direct experience, and the philosophical discussion follows from that.

Q1: default view being that you are a person-object in a world-place, where "the world" is assumed to be a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'"
I don't really hold that view either, but some combination of that and what you're saying. So if I choose to embark of a journey of large jumps, I could not feel at ease that "I've always been jumping infinitely". There would be something fundamentally different about doing it with a type of intent I never tried to use before. People can call it Magic, Playing God, whatever.

Well, the "I've always been jumping infinitely" view has problems in any case, and would not in fact ease your mind if you went into it more deeply. Luckily, though, the "meta" view circumvents this anyway - the "meta" view being the recognition that all experiences are "shapings" from, or states of, this "experiencing" (or "awareness"). And so, again, all experiences are on an "as if" basis only. That is, they are "patternings" of you-as-awareness. Which means there is only one type of intent! "Intending" is equivalent to "increasing the prominence of a particular pattern within your state", where your "state" corresponds to the full definition of the world within you and the fully-determined sequence of sensory moments which follow from that. If you intend the outcome of "it is true now that my arm will move now" then that is the same in type as the outcome "it is true now that I will ace my exam then".

Aside - Note that you are not - necessarily - intending or shifting "all the time", in this description. Only when you redirect unfolding experience, or deliberately assert or imply something, are you doing that. This can be tricky to articulate, because of course intention is "outside of" time, since time is itself a patterning within and a formatting of state. In particular, "intending" is not the same as the experience of apparently "doing something". The experience of "doing" is itself a result, a sensory experience that is an aspect of the current state. (Which of course means you never actually experience "causing" anything.)

Calling things "magic" or "playing god" is merely an artefact of a particular intentional outcome being exceptional in the context of the standard description, rather than it being exceptional in the context of experience-as-it-is. There is no "magic", there only just "patterning" (your current state) and "intention" (the intensification of a pattern and therefore a reshaping of your state). Ultimately, though, none of this matters. If you recognise that there are only experiences, and descriptions of and thoughts about experiences are themselves just more experiences (at the same "level"), then you are left with merely: a) attending to the nature of the current moment directly, b) experimenting to see the extent to which you can alter it. And stories you come up with about that are actually not particularly relevant or true - other than as formattings that you can use to formulate your intentions, and therefore the extended patterns associated with your target outcomes.

(For some previous discussion on this, perhaps see the exercise in this comment [POST: In what way are other people real?] and the metaphors in this comment [POST: [THEORY] The Nature of Consciousness].)

There are people who devote their whole lives to occult and insist on performing unethical rituals in their practice.

Because they seem to be true. Why?

In short: "patterning".

Now, although "patterning" is itself a metaphor, it is meant to offer an example of the most minimal description that captures the fact of "experience is apparently structured". The implication of "patterning" and "intention is the increasing of one pattern's contribution to your ongoing experience" is that:

- Whatever you intend in terms of, will seem to be true, because it will result in experiences "as if" that were true.

And now:

Why not just choose another way to intend?

There is only ever one way to intend - or actually it is not even a "way", because intending is actually not a "doing" or "technique" or "mechanism" at all. It might be better describe as a "self-shaping" (of you-as-awareness). But you can intend any pattern, and any pattern you intend also includes its extended associations. Any intention is, sort of, a shift of the entire world-pattern, in terms of the larger meanings associated with the intention. But you might not know this, particularly if you only pay attention to the content of particular experiences and don't notice the context of all experiences - and if you think that your apparent actions are "causal" rather than also being "results" (of intention, which is the only cause). Now, I realise the above might sound a bit abstract, so:

More specifically, then: if you intend an outcome in terms of "the Norse gods", then in addition to your outcome you will also tend to bring about an increase in the pattern "the Norse gods exist", because it was implied by your intention. If you aren't aware that there is this "meta" perspective of viewing such things - and perhaps you haven't also intended in terms of other things - you will likely become convinced that "the Norse gods" are real in an independent way, and the evidence will stack up more and more as you intend in terms of them. After all, you are literally experiencing the truth of their existence! Furthermore, if you are performing certain rituals, then you might think that they, too, exist as real mechanisms, because you are having experiences "as if" they are true (even though in actual fact "performing a ritual" is just yet another experience, an aspect of your current patterned state, as is any seeming outcome).

"Anything goes", but it only "goes" if you intend accordingly - and until you intend in terms of something, there might be zero evidence of that something! Although having said that, it tends to be the case that intentional thinking about a thing tends to lightly pattern your ongoing experience with that thing - see synchronicities, for example, or the Owls of Eternity exercise linked in the sidebar.

...

*Q2: Nice to see you back, Gorgeous (not a typo).
I was wondering what your views were on one thing that I have pondered about a lot, but haven't really come to a conclusion or even much of an idea about.
When talking about other people, since the concept of "person" isn't really real, are we just interacting with different versions/patterns of someone and the version we get is just our own projection? Trying to put this in words makes it convoluted, because I have to talk in terms of separation to try and get my question across. For example, could you experience as if someone only existed to please you? I wonder stuff like that because despite seeing that "I as person" is not real, I only have guesses as to if what looks like other people still have any sort of sentience or will of "their own" because if you were to intend for something like a relationship that lasts forever, you may assume that the other person could dump you because they are "an external person who can make their own choices" unless that is just a projection.
Hopefully you get what I'm talking about.*

Heh!

Yes, it's really hard to put into language, so we end up going at it from multiple angles and, we hope, the combination of all of those then points to the thing we actually mean. I think it's perhaps helpful do away with the whole idea of "projection", though, since that still implies there's an activity taking place, from one object onto another. So, two possible approaches that occur for talking around the subject:

First, stick to what you actually experience and make a distinction between that and what you infer.

One observation along those lines: your ideas about "other people" to some extent are due to what you see in the mirror, and "other people" also being that shape and with those movements and so on. Since you experience yourself as having thoughts and ideas, you might map that onto other people. However, your thoughts are not actually experienced as being in the world. There is the person-in-world image, and there is thoughts. Your you-as-person experience isn't what is thinking, really; that's just content. Rather, the thoughts are appearing in the you-as-awareness experience alongside the person-in-world experience. Another: going back to that mirror experience, perhaps consider what you actually look like, your actual experience. Is that the image in the mirror? If you think so, why do you think so? If it isn't, what do you look like really?

Second, and following on from that, consider that the world is a single continuous pattern, a "world-pattern", one that is static but fully defines the world and all possible experiences associated with it, in a given state (until it is shifted via intention to a new state, occasionally). The sensory experience you have, then, is the "sensory aspect" of that world-pattern, unfolded from a particular perspective, for a particular series of moments. ("Time passing" is also a static pattern, in this description.)

This pattern is not a projection, then, and is more like a "shape" you have adopted. The full definintion is "enfolded" within you, with sensory moments "unfolded" within you in sequence. It follows that all "people", including the "person" you are apparently experiencing being, are patterns which are aspects of this world-pattern. They are all "alive" in the sense of being "made from" awareness; but they are not themselves aware. They are not experiencing. Rather, awareness is aware of them, as them, since awareness is the pattern including all the people-patterns. Only "awareness" is experiencing (and "awareness" is itself really a synonym for "experiencing" or the fact of experiencing).

Here we must be careful not to conflate "experience of" with "expanded as a sensory moment". Right now, you-as-awareness is experiencing being the entire world-pattern, even though only this particular person-in-a-world moment is unfolded as a spatially-extended sensory aspect. The language we use to describe a particular everyday experience can be a bit misleading here, because it's all quite course-grained and in terms of particular objects. If you actually attend to your ongoing experience directly, it's much more subtle than that: you experience "meaning", and I'd say the sense in which you experience being the world-pattern is like experiencing "meaning".

Anyway, those are a couple of avenues worth exploring. As always, though, we're invoking metaphors or arranging concepts in order to describe something which is actually super-simple: experience just is, with nothing behind it. Although: we must also consider the observation that adopting particular concept tends to shape experience accordingly. Which loops back to, say, the idea that adopting directly or implicitly the concept of "an external person who can make their own choices" is effectively a patterning of your own experience (your world-pattern or state) such that it is shaped "as if" that were true.

[Split this into two parts because it got a bit long.]

Part One

there aren't many "people" on here who enjoy exchanging several paragraph long posts.

It's tricky sometimes. To discuss this topic properly usually requires a bit of back and forth before we even get going - since we need to work out what exactly one commenter means by a particular phrase versus another, and there's a need to provide context for most things, rather than snappy one-liners. I personally try to encourage deeper thinking and discussion throughout the sub, but it's very time-consuming for people to have that sort of conversation, particularly when a lot of time has to be spent describing, for example, "why what you say isn't wrong, but is meaningless from a different perspective, and here is the other perspective", and so on. Anyway -
